Hase, Karl August von (1800-90), Ger. theologian, b. at Steinbach in Saxony. In theologian, b. at Steinbach in Saxony. In 1829 he was appointed prof. of philosophy at the Univ. of Leipzig, and prof. of theology at Jena in 1830. His best known works are Die Leipziger Disputation (1827) Leben Jesu (1829, Eng. trans. 1881), in which he anticipated the arguments put forward by Strauss; Theologische Streitschriften (1834-37), Die Tubinger Schule (1855), Hutterus Redivirus (1883), Lehrbuch der Kirchengeschichte (1886, Eng. trans. 1895), Die Beiden Erzbischöfe (1839) and an ed. of Libri Symbolici Ecclesiae Evangelive. See life by R. Buerkner 1900. Hassk, Jaroslav (1883-1923). Czech writer, b. at Prague, author of The Adventures of the Excellent Soldier Schweik during the World War (1921). See further under Czechoslovakia—Literature. Haselrig. Sir Arthur (also Haselrige,

Haselrig, Sir Arthur (also Heselrige, Hazelrigg), one of the five members whom Charles I. ordered to be arrested for high treason on Jan. 3, 1642. The others were Pym, Hampden, Hollis, and Strode. The Commons r freed to give them up.

Hashisu, of Hasheesh, Arabic name, meaning literally 'dried herb,' for the various preparations obtained from the thowering tops of the Indian hemp plant (Cunnabis indica). It is used as an intoxicant in sov. E. countries (called 'bhang') cant in sov. E. countries (called 'bhang' in India), and is either smoked, chewed, or drunk. It is valuable as a narcotic, and is sometimes employed in medicine as an anodyne. The Eng. word 'assasin' is probably derived from the Arabic' hashishin,' i.e. hemp-caters, who committed great excesses when under the intinence of hashish. See Haws.

Haskerland, com. in the prov. of Friesland in the Netherlands, Pop. about 8000.

8000.

Haslemere, mrkt. tn. and par. of England in the co. of Surrey in the Guildford div., 10 m. from Farnham, and 8 m. from Godalming. Near by is Aldworth House, Tennyson's last home. The tn. is situated in very picturesque surroundings, and is a favourite residential place. There is a Royal School for Naval and Marine Officers' daughters at H. Hind head Common with its celebrated Devil's Punch Bowl is quite near. Pop. 13.300

Haslingden, mrkt. tn. and municipal bor, of England in the co. of Laucashire It is in the diocese of Manchester, and has two railway stations, Haslingdon and Helmshore. It has a church dating from the thirteenth century. It manufa-cottons, silks, woollens. There are coalcottons, silks, woollens. There are mines in the vicinity. Pop. 15,700.

Hasmoneans. sce ARMONEANS

MACCABRES.

Hasps, in. in Gormany, prov. of Westphalia, hoted as the seat of an important iron and steel industry, and manufactors, etc. Pop. 25,000.

Hassail, Arthur (1853-1931), Eng. historian, b. at Bebington, Cheshire; second son of Henry Burton H. Educated at Uppingham and Oxford. In 1880 he became a lecturer and tutor in hist. at Keblo College, and in 1883 at Christ Church. His works include: Life of Bolingbruke (Statesmen Series, 1889), Lunis XIV. (Heroes of the Nations, 1895), The Making of the British Empire (1896), A Hambook of European History (1897), The Balance of Power (1896, 1898, in the Periods of European History Series, of kindish History (1901), History of France (1901), The French People (1901), Mazarin, (Forgian Statesmen Series 1903), History (1901), The French People (1901), Mazarin, (Foreign Statesmen Series 1903), History of France (Temple Primers, 1903), The Trulor Dynasty (1904), A Brief Survey of European History (1906), The Expansion of Great Britain (1907), Castlereagh (1908), The Great Ribellion (1909), Modern Europe (1910), The Great Napoleon (1911), History of British Foreim Policy (1912) History of British Foreign Policy (1912), France, Medieval and Modern (1918), A British History chronologically arranged

Hassan, dist. of Mysore state, India. The chief tn. is H. in the centre of the dist. H. is bounded on the S. partly by the state of Coorg, and on the S.W. by the Madras dist. of S. Kanara. Its erea is 2547 sq. m. The dist, is divided into two portions, the Mainad, or hill-country, including some of the highest ranges of the W. Ghat, and the Maidan, or plain country, in the direction of Mysore to the S. Staple cultivation, dry and wet crops. Pop. 600,000.

Hassan and Hussein, sons of Ali and Mohammed's daughter Fatima:

Hussin (625-69) succeeded his father as Caliph at Kufa in 660, but in a few months retired in favour of his rival Moaweeyah, and went to live at Medina, where he attained a great reputation for plety. He is said to have been poisoned

by one of his wives.

by one of his wives.

Hussein, or Hosein (629-80), succeeded his brother Hassan as Imam of the Shittes, and claimed the caliphate also. In attempting to depose Moaweeyah, he was killed by the latter's troops at Kerbela. The two brothers are held in the greatest veneration by the Shittes, who hold an ann. festival in their honour, at which their deaths are deaunthally who hold an ann. festival in their honour, at which their deaths are dramatically represented. See G. Weil, Geschichte der Chalifen, 1815; Sir L. Pelly, The Miracle-Play of Hasan and Hosein, 1879; and M. Arnold 'A Persian Passion-Play in Resays in Criticism, 1865.

Hasselt (Hassetholt, hazel grove), chief the prov. of Limbourg in Belgium. It is 16 m. from Maastricht by rail. It has manufs, of linen fabries, tobacco, and

has manufs. of linen fabrics, tobacco, and gin-distilleries. Chicory is largely culti-vated in the surrounding dist. The

1

in 1831. Pop. 29,200.

Hassler (or Hasler), Hans Leo (1564–1612), Ger. composer, b. at Nuremberg, the 1612), Ger. composer, b. at Nuremberg, the most famous member of a distinguished musical family. He began his career as an organist, his father being his teacher; he studied in Venice under Andrea Gabrieli, composer of choir and organ music. With Michael Practorius (real name Schulz; 1571-1621) a composer, and author of a valuable compendium of the musical knowledge of the time entitled Syntagma musicum (3 vols., 1615-19), he is regarded as a master in the period of ther. renaissance. His chief works are tier. renaissance. His chief works are church music and songs. He wrote the familiar Passion chorale, O Haupt voll Blut und Wunden, and a number of wellknown chorale melodies in the motet form. Most of his organ pieces, motets and madrigals, which are important in the hist. of Ger. music, have been republished in modern times.

Hastinapur, ruined city of India, in the Meerut dist.. United Provs., on banks of former bed of Ganges. At one time it was the cap. of the Pandava kingdom.

Hastings, Francis Rawdon (1754-1826), first Marquis (1817), a Brit. soldier and administrator, b. in Co. Down, Ireland, the son of Sir John Rawdon of Moira: later Earl of Moira: educated at Harrow and Oxford, and entered the army. From 1775-82 he was on service in the Amer. war, fighting at Bunkers Hill. Brooklyn, White Plains, Camden, Charleston, etc., White Plains, Camden, Charleston, etc., and was created a peer, as Baron Rawdon, on his return in 1783. In 1794 he fought against the Fr. in Flanders; was appointed commander-in-chief in Scotland, 1803; became master-general of the ordnance, 1806; and governor-general of India in 1813. The chief events of his administration were the wars against Nepal (1814-16) and the Mahrattas and Pindaris (1817-18). He retired in 1823, and was appointed governor of Malta in 1824. 1824.

Hastings, Sir Patrick Gardiner (b. 1881). Hastings, Sir Patrick Gardiner (b. 1881), Ing. lawyer. Edicated at Charterhouse. Elected Labour M.P. for Wallsend, 1922, and again in 1924, when he became Attorney-general for the first Labour gov. in England. Publications: (plays), The River (1925), Scotch Mid (1926), and Escort (1942), and The Autobiography of Patrick Hustings (1948).

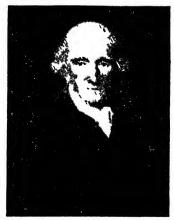

Escort (1942), and The Autobiography of Patrick Hustings (1948).

Hastings, Selina, see HUNTINGDON, SELINA, COUNTESS OF.

Hastings, Warren (1732-1818), first governor-general of India, went out in 1750 to Calcutta, where the influence of his uncle had secured for him a cadetahip in the E. India Counterly's service. He his uncle had secured for him a caceusing in the E. India Company's service. He rose rapidly, and became a person of such considerable importance that eleven years after his arrival in the country he, having already filled other posts with credit, was appointed a member of the Calcutta council. In 1764 he returned to England. Unlike most of his colleagues, had a deal made no attempt to among a private he had made no attempt to amass a private income, and had nothing but his savings to live upon, and these were so incon-siderable that they were already ex-

Belgians were defeated here by the Dutch in 1831. Pop. 29,200.

Hauster (or Haster), Hans Leo (1564
Company's offer to go out to Madras as second in council. Two years later he second in council. Two years later he was promoted to the governorship of Bongal. He now fulfilled the hopes of the directors at home, and proved himself a wise and far-seeing administrator. He instituted reforms, both in the gov. of the prov. and in the law courts, that were taken as models by his successors. upheld treaty rights and removed abuses, but was vigorously opposed by some members of his council, his most bitter opponent being (Sir) Philip Francis, whom in 1780 he wounded in a duck. In 1785,

WARREN HASTINGS

having done magnificent work, he resigned his office and returned to England. At once an agitation was set on foot by Francis and others, who enlisted the sup-port of Burke, and he was impeached in 1788 for corruption and cruelty. The trial dragged on for seven years, when he was acquitted on all counts. His exwas acquitted on all counts. His ex-penses in connection with it amounted to \$70,000, his entire fortune. Thereupon the E. India Company, very rightly, but to the great indignation of Burke, granted him a handsome peusion, which enabled him to fulfil his long-cherished dream of repurchasing the family estate of Daylesford. In later days, largely owing to the kindly influence of the Prince Regent (afterwards George IV.), he was reinstated in popular opinion, though his impeachment was never officially reversed. Mill, the historian of India, declared that few men would be found whose character would present a higher claim to indulgence than his, and this view is now generally accepted. There are biographies by G. E. Gielg, 1841, and by L. J. Trotter, 1878. See E. Gilllat, Heroes of Modern India, 1911; M. E. Monekton-Jones, Warren Hastings in Bengal, 1918; repurchasing the family estate of DaylesH. Dodwell, Letters to Sir John Mac-phereon, 1927; P. Moon, Warren Hastings and British India, 1948.

Hastings, watering place, parl., municipal, and co. bor. in Sussex, England, 33 m. E. of Brighton and 62 m. S.S.E. of London by rail On the S. it is open to the Eng. Channel, but clsowhere surrounded by high cliffs. Il. has an old and new tn., the former—described as the new burgh in the Domesday Book—between the E. and W. Hills, being chiefly in the bloomed by Torons. inhabited by fishermen. A fine prome-nade runs for 3 m. along the sea front to St. Leonardy-on-Sea, which is within the bor. Apart from catoring for visitors, ishing is the chief industry, and there is a lish mykt. Belog sheltered by the hills inland from easterly and northerly winds, H. is a well-known resort for those suffering from pulmonary complaints, in the winter and spring. The climate is dry, mild, and salubrious. There are sev, public gardens, the chief of which is the extensive Alexandra Park and the tn. Among has 410 ac, of public open spaces. Among the centres of entertainment and recreation are the White Rock Pavilion, the White Rock Gardens, and the bathing pool. Some 6 m. from H. is the great Abbey. St. Martin's of Battle, which Wm. I., to commemorate bis victory at the 'Battle of Hastings,' built on Senlac Hill, the sc. at site of the battle. If m from H. is Bodiain Castle, a splendid example of a medieval fortress, with round towers, gateway and moat. It was preceding the the pattern by the Maranase has 410 ac. of public open spaces. round towers, gatoway and moat. It was presented to the nation by the Marquess Curron in 1923. 10 m. from H. is Peven-sey Castle containing three fortresses— the coast guird fortress of Anderdia, a stone keep built by Robert of Mortain and a fort round the keep built in the thirteenth century. R. derives its name teenth century. It. derives its name from Haest for Haesten), the intrepul Dane who 1:0) years ago founded the me or settlement which, as Hastings, rose to eminence as a port during Saxon times and, in the reign of Athelstan, boasted not only a busy harbour but a Mint. It was the chief of the five ports which were ainalgamated by Edward the Confessor into the Contederation of the Cinque Ports in the Norman period it was the chosen port of embarkation and return for the Norman court when the monarches visited their continental domains. The great castle founded by Wm. the Conqueror, the rums of which dominate the tn. to-day, was the scene of many royal coremones. After John lost Normands in 1204 H. declined rapidly. The harbour was gradually silted up by the 'eastward, drift' of the sea—a process coincident with the building of bigger and yet bigger with the building of bigger and yet bigger ships drawing more water. By the fourteenth century H. was little more than a hishing vil., and its decline was accelerated in the same century through being four times sacked by marauding Fr. In its heyday H. contributed twenty ships fully manned to the Cinque Ports ravy. In 1400 its centribution was outst three. These was a bilet revised of Ports mayy. In 1400 its contribution was mazon, and Saginaw railways. Popouly three. There was a brief revival of 5000.

Hastings, Battle of, the usual name when, in 1588, H. again furnished its full given to the great battle at Senlac, near

complement of twenty ships to help fight the Armada. As a reward the queen gave the tn. its Charter and the Bailiff of H. was given the title of mayor. Attempts to reconstruct the harbour, however, failed, and H. soon sank again into obscurity. Its next appearance in the pages of hist. was during the eighteenth century—as a notorious centre for smuggling. During the latter half of the eighteenth century. the latter half of the eighteenth century, the tn.'s present reputation as a watering place was founded—a development more or less concurrent with that of Brighton. A Dr. Bailey, supported by John Collier, mayor of Hastings, publicised the air of the tn. as especially favourable for pulmonary sufferers. The H. of the sixteenth and seventeenth centuries was practically confined to what is to-day called the 'Old Town' but during the last years of the sighteenth century and the years of the eighteenth century and the early years of the nineteenth the ta rapidly extended beyond the W. Hill, and such fashionable suburbs as George Street, Pelham Place, etc., came into being. In 1827 Decimus Burton, the architect, founded St. Leonards to the W. of the tn. soon, under royal patronage, to become the most fashionable resort in the country. St. Leonards and H. gradually developed into the composite whole which is now the co. bor. of H. with a resident pop. of

65,000.

H. and St. Leonards declined somewhat during the 'nineties and the first decade of the present century owing to lack of of the present century owing to lack of enterprise; but between the two World Wars, over £4,000,000 was spent in improving the attractions and amenities of the tn. Then came the Second World War and H. from 1940 onwards found itself in the front line. It suffered 87 raids: 550 H.E. bombs and 15 V-1 rockets burst in the bor. The old parchurch of st. Leonard's was completely church of St. Leonard's was completely destroyed, and the Church-in-the-Wood, associated with Charles Lamb, was dam aged. Nearly 16,000 properties were destroyed or damaged-more than two-thirds of the bor.'s total. The pop. at its lowest ebb, fell to 15,000. The whole front was, however, transformed into a tremendously strong defence line. In 1944, evacuees returned in fairly large numbers, and in 1915 the pop. had reached 44,000. Be tween May 1945 and May 1948, 21,000 people were re-housed and the pop. prac tically re-estab, at its pre-war level.

Hastings: (1) Bor. of Now Zealand.
N. Island, in Hawkes Bay co., 11 in.
S.S.W. of Napier. Its industries are of an agric. nature and there is a canning factory, the largest in New Zealand. Pop. 22,000. (2) ("ity of Nebruska, U.S.A., in Adams co. It has an altitude of 1917 ft., and is 130 m. W.S.W. of Omaha. It is served by four reliwary and is a shipping. served by four railways and is a shipping centre for grain and live stock. It is the seat of Hastings College and a Catholic Academy, Pop. 15,100. (3) City in Michigan, U.S.A., cap. of Barry co., on Michigan Central, and the Chicago, Kala-

Hastings, where Wm , duke of Normandy, defeated the Eng under Harold in 1066. The battle took place on a hill, to which a later chronicles gave the name of Scolac, about 6 m from Hastings On its sum mit was firmly posted Harold & force the Normans being ranged in three divs, the centre one of which was commanded by the duke bimself. The Normans were repeatedly driven back by the Eng, but at length, by a feigned flight, the latter were drawn from their stockade, and routed

Hastings Beds or Sands, part of the Lower Cretaccons series and a lower div of the Wealden beds. They vary in thickness from 500 to 1000 it, and consist mainly of sand and sandstone with subordinate layers of clay. They have the steer in the sand the strata, which differ only slightly from those of the over lying Weald clay, are highly fossiliterous

land, 6 m 1 of Durham Prop 6000 Hat, covering for the head like all articles of apparel, has a bist, and if you intere for to trace its gradual

evolution from earliest times in the simple evolution from earliest times in the simple close-fitting cap to the many elaborate structures supplied by the demands of a twentieth century civilisation. The word II comes from the A 3 hot, and Ger. If ut, hat The A 5 hot consisted of a woolkn cap, and was worn by the higher class of the A. S. But centuries before this time caps or coverings for the head were worn amongst the Oriental nations, when they had a certain religious significance, as in the case of the 'pilos' worn by the Jewish levitical priest It is conjectured that the oldest head covering was the circular close-fitting cap, either was the circular closs-norm, some plan or braided, which was worn by captive from Palestine in Assyria, and which also appeared on the heads of various duties among the heathen tribes There were two kinds of headcovering worn by the cks in carly times, the pictus, and the pictus, The pileus had no brim, whilst the pictus was made of felt, and had a wide brin to protect the igning Weald Clay, are nightly fossiliterous of felt, and had a wide bring to protect the and contain numerous saurian reptiles weater from the rays of the sun. The and the remarkable lepidotus and the research to be said to be the direct besides the remarkable lepidotus and the research to the Gk petasus, but did not be longing to the ganoid or plucoid to a tree into voge in England till the order.

Haswell, in in the coof Durham, Eng to desire the line of the time of the Norman conquest the Physical cap flat bounct, and bringmed H were won. With the divance of centuries new fashions cropt articles of apparel, has a bist, and it is an adopted from intercourse with other volve intermaliance. This is especially noticeable in nations

Tudor times, where we meet with wide change almost from season to season. Hs. crowned with plumes and feathers. For the last few years the tendency has and with low-crowned caps with upturned been for hats to be worn well to the back brims. Beaver felts in many shapes came into vogue in Queen Elizabeth's reign, and into vogue in Queen Elizabeth's reign, and were the common form of head covering for three centuries. That the H. has played its part in the making of hist, is evident from the fact that in the Civil war in Charles I.'s reign, the distinguishing feature of the Roundheads or Puritans was the high-steepled H. of plain felt, whilst the Cavaliers' head-covering was adorned with feathers. A century later the three-cornered cocked H. became the prevailing fashion, owing, no doubt, to prevailing fashion, owing, no doubt, to the necessity of looping up the extrava-gant width of the brim. At one time felt Hs. were manufd, exclusively of beaverfur, but the scarcity of this animal made it necessary to use other materials such as fur, a mixture of fur and wool or wool only. The fur or hair of rabbits, beaver, musk-rat, and camel was used for the finer Hs., whilst sheep's wool was used for the inferior felted Hs. The cheapest for the inferior felted Hs. The cheapest kinds of felt were also made with wool mixed with cotton and other vegetable fibres; in this case they were not really felted, but cemented by varnish which helped to hold together the fibres and to stiffen the H. body. The manuf. of the silk H., a stiff body with a covering of a plush of silk, almost universally worn by men of the unper and middle classical during the silk of the unper and middle classical during the silk of the unper and middle classical during the silk of the unper and middle classical during the silk of the unper and middle classical during the silk of the unper and middle classical during the silk of the unper and middle classical during the silk of the s men of the upper and middle classes during the Victorian and Edwardian eras, began early in the nineteenth century in England. It was invented in Florence about 1760, but the fashion was not accepted till half-a-century later. Its manuf. was not introduced into France till about 1825 and its development has taken place entirely since that date. Now, after a century-and-a-half, the silk tile, or tophat, has gradually gone out of use except for ceremonial occasions. In the days be-fore the Second World War grey top-hats were worn at Ascot and at other fashion-able events. The folding, or collapsible opera-hat, made of dull material, was used with evening dress for theatre-going etc. in the early days of the contury. Before the the early days of the century. Hefore the late war the blocked black felt homburg hat, known as the 'Anthony Eden' was worn with evening dress by younger men; and also very considerably by day as well, with tn. clothes. For golf and walking rather large tweed caps, often with check pattern, were affected in the thirties (a fashion sponsored by the duke of Windsor, as was the wearing of the small Basque beret). Berets continue to be worn by men for country pursuits, often those made familiar during the war years—the nirborne and tank corps berets. The hard felt bowler hat, wern very widely in the early part of the century, has gone almost completely out of fashion and has been superseded by the soft felt hat, or the blocked homburg. The agric, worker or farm labourer continues to wear a cap when working, often of a small, old-fashioned type, although the average young man walking in the country goes hatless. men for country pursuits, often those made hatless.

of the head; small round caps, felt bonnet shaped hats, large cartwheel shapes. Triminings are varied—veiling, ribbon loops and bows, flowers of all chapes. Trimings are varied—veiling, ribbon loops and bows, tlowers of all descriptions, and now feathers, have been introduced in an attempt to soften the rather severe plain styles which were worn during the 1939-45 war years, if indeed hats were worn at all. During the war years most women, at any rate the younger women, went hatless and instead of buying new hats as they had done in the past went in for elaborate and varied hair styles. It was quite a common and hitherto unusual sight to see smart and hatless women in the West-End of London. Those who wished to have their heads partially covered used to twist scarves round their head to form a sort of bandeau, leaving the crown of the head uncovered, or tied triangular scarves under the chin in peasant fashion: this style possisted and became almost a uniform in many and became almost a uniform in many parts of the country, probably because it is practical and tidy in all weathers. The difficulty of buying Hs, and the resulting practice of going halless resulted in a relaxation in many churches of the enstorn of admitting women only when their heads were covered. Light weight felts are taking the place of straw hats for summer wear.

wear.

Hatay, Turkish name for the Sanjak of Alexandretta (q.r.).

Hatfield, or Bishop's Hatfield, mikt. tn. of Hertfordshire, England, on the Lea, 171 m. from London by rail and 64 m. W.S.W. of Hertford. Apart from Hatfield House (q.r.), there are the ruins of a palace, once the residence of the bishops

palace, once the residence of Ely. Pop. 7000.

Hatfield, vil. of Yorkshire (W. Riding),
England, on the Don, about 7 m. from Doneaster. With the opening of coalmines the vil. has become a prosperoucolliery centre. Hatfield Chase, the dist. around the vil., was once a forest and hunting ground of kings. This forest lay between the rivs. Don, Idle, and Thorne. A great part of it was marsh, and in 1626 it was drained by Dutch engineers.

Hatfield Forest, 3 m. E. of Bishop's Stortford, Essex, with 1049 acs. of rolling country and some pine tunber. It was part of the Royal Forest of Fssex main-tained from Tudor times till 1915. It includes an auct, camp at Portinbury Hills. and a lake for boating and fishing.

Hatfield House, Hertfordshire residence of the marquess of Salisbury and one of the finest Jacobean houses in England. the finest Jacobean houses in England. Stands in a park some 10 m. in circumto bowler hat, worn very widely in the representation of the century, has gone almost purpletely out of fashion and has been appeareded by the soft felt hat, or the perseded by the soft felt hat, or the preseded by the soft felt hat, or the soft felt hat consists to day of three wings, a main north wing, with the collection. In the soft felt hat, or the soft felt hat the down and the materials used for the foundations of the house which was built between 1607 and 1611, with Robert Lyminge as architect. The features of the house are the lofty marble hall, which contains the original panelling, a finely-carved musiciaus' gallery, and a number of portraits, including two of Queen Elizabeth. There is a third portrait (by Curcary) of the gueen, at the foot of the Elizabeth. There is a third portrait (by Zuccaro) of the queen, at the foot of the grand staircase, with its gracefully carved newel posts topped with cherubs and heraldic animals. Near the head of these stairs hangs one of the very earliest Eng. sporting paintings—the picture of Queen Elizabeth's white horse and its groom dated 1593. In the long gallery, which runs above the marble duning hall, is a carved oak cupboard containing Elizabeth's genealogical tree, tracing her beth's genealogical tree, tracing her ancestry back to Adam. In James I.'s drawing-room so called from the statue of him above the freplace, are family por-traits by Romnoy, Reynolds and others, and a fine Wilkle portrait of the duke of Willington. All along the S. side of the first-floor runs the panelled Long Gallery; and from the windows is a tine view of the

and from the windows is a line view of the formal garden and maze. See J. S. Brewer, Enalish Studies, 1881.

Hath vay, Anne (1556-1623), wife of Wm. Shakespeare. She was probably Agnes, daughter of Richard Hathaway, of Shottery, near Stratford-on-Avon, where the Hathaways' cottage still where the She was married in 1582, about six months before the birth of her daughter Susannah, May, 1583. Her only other children, Judith and Hannet (twins), were

born 1325. Hamnet died in 1396, Under her husband's will, Anne took only his second-hest bedstad. Hathersage, vit. of Derbyshire, about 34 m. from Manchester and 161 m. from London, on the Midland Region railway. Around the vil. is some of the fine-t of the Derbyshire scenery. Little John, hench-man of Robin Hood, is traditionally supposed to have been buried in the churchyard. Pins and needles are made here. Some 3 m. S. of H. is Froggatt Wood, purchased in 1939 by the Shettleld and Peak Dist. Branch of the Council for the Preservation of Rural England.

Hatto I., archbishop of Mainz, came of a Swablan family, and obtained his arch-bishopric under Arnulf, a Ger. king, in 891. He was so popular with this mon-891. He was so popular with this monarch that he received the nickname of 'the heart of the king.' Upon the death of Arnulf, in 899, H. was appointed regent of Germany and guardian of the young king Louis. He exercised his power in a very arbitrary way, and was guilty of many crimes in the course of his career. This, no doubt, accounts for the legend of his being thrown into the crater of Mount Etna. He died in 913.

Hatto II., was archibshop of Mainz from 968-970; bis name is associated with the legend of the Mouse Tower at Bingen, where he is reported to have been de-

voured by mice.

SIR CHRISTOPHER HATTON

Hatton, Sir Christopher (1540-1591), kng. statesman and lord chancellor, b. at Holdenby. Was the reputed favourite courtier of Queen Elizabeth, through whose influence he became lord chancellor Hathersu, or Hatshepsut, queen of the eighteenth Egyptian dynasty, daughter of Thothmes I. and sole heiress to the Egyptian throne. For fifteen years she in 1587—a remarkable appointment in view of the fact that he was not a professional lawyer. Very little is known of his career which is what might be expected in the case of a man whose success was due chiefly to his social qualities. He was educated at St. Mary's Hall. Oxford, and kept terms at the Inner Temple; but instead of following the law, he played the courtier, and, it is said, first attracted the queen's attention by his dancing at a masque. In J. C. Campbell's Lives of the Lord Chancellors (1868), he is described as a 'gay young cavalier, never called to the Bar, and chiefly funed for his handsome person, and his skill in dancing.' He appears, however, to have had sufficient natural capacity to acquit himself without disaster on the Woolsack; and sev. legal treatises, such as A Treatise concerning Statutes or Acts of Parliament, are ascribed, though not by lawyers, to him; and some attribute to him the authorship of the fourth act in the tragedy of Tuncred and Signsmunds. His death was the result, according to some historians, of 'a broken heart' through the queen's demanding payment of a debt queen's demanding payment of a door which he was unable to meet. Sec N. Harris Nicholas, Life and Tunes of Sir Christopher Hatton, 1847.
Hatton, John Liptrot (1809–86), Eng musical composer, b. at Liverpool. After

holding many appointments as organist in Liverpool, he came to London in 1832, ten years later he was appointed conductor of Drury Lane Theatre, where his own operetta, Queen of the Thames, was produced. Some years later he was the accompanist of the St. James's Hall Ballad Concerts. He also composed the songs, Goodnight Beloved, Sunon the Cellarer, and

To Anthea.

Hat-trick, in cricket, the name given to the feat performed by a bowler who takes three wickets with three successive balls, not necessarily in the same over. Tho term may have originated from the practice of giving hats to successful sportsmen, notably wreatiers, but is more likely to have come from the handing-round among the spectators of a hat for the purpose of making a collection of money for the player who has shown his provess.

Hattushash (modern Bogaz Koy), cap. of Hittite (q.v.) ompire.

Hatvan, tn. of Hungary, 30 m. R.N.L. of Budapest, with a large castle. Pop. 9500.

Hauch, Johannes Carsten (1790-1872),
Dan. poet and dramatist, b. at Fredenkshald, Norway, of Dan. parents. In 1816
he became prof. of Scandinavian languages at Kiel: in 1848 returned to Copenhagen, and from 1858 60 was director of the Dan.
National Theatre. His works include collections of Poems (1842), and of Lyrnal Poems and Romances (1861), Valdemar Seir (1862, an instorical epic), and some very fine tragedies produced between 1841 very fine tragedies produced between 1841 and 1866, including Svend Grathe (1841). The Sisters at Kinnekulle, Marshal Sig (1850), Honour Lost and Won, Tycho Brahe's Youth, The King's Favourite, and Henry of Navarre. He was one of the group of romantics around Ochlenschlager. Hauff, Wilhelm (1802-27), Ger. author, b. at Stuttgart. In 1826 he produced b. at Stuttgart. In 1826 he produced Lichtensteen, an historical novel in the

tradition of Sir Walter Scott, which became very popular. His other work includes: Mittelungen aus den Memoiren des Satan (1826), Bettlerin von Pont des Aris (1826), Phantasien im Bremer Rats-keller (1827), and Marchenulmanach auf das Jahr 1820 (1826), and some short poonis.

das Jahr 1826 (1826), and some short poems. See Tidemann. Hauff in Bremen, 1929.

Haug, Martin (1826-76), Sanskritist, entered the univ. of Tubingen in 1848, where he studied the Oriental languages. He went to India in 1859 as prof. of Sanskrit at Poona. Bosides writing Essays on the Sacred Language, Writings, and Religion of the Purses (1862), he pub. valuable material for all students of the Interatures of anct. India and Persia. and Persia.

Haugesund, scaport in Norway, 36 m. N.W. of the tn. of Stavanger. Its harbour

is from 17 to 50 ft. in depth. It has important isheries. Pop. 18,000. Haughton, William (c. 1575-1605), Eng. dramatic writer of the seventeenth century who collaborated in many plays with Henry Cheetle and Thomas Dekker. Philip Henslowe mentions in his diary how he helped to release H. from 'the Clink by a loan of ten shillings. He is supposed to have written the greater part of The Picasant Comodie of Patient Grissill (1603).

Haulbowline, is. S. of co. Cork, Ireland, situated in Cork harbour, opposite Queenstown It has a convict station, artillery barracks, and various ordnance works

Haumt-es-Suk, see unager JI.RBA. Hauptmann, Gerhardt (1362-1946), Ger. dramatist, not clist, and poet, b at Ober-sulzbrunn, Silesia, son of a hotel-keeper; educated there and at the Realschule in Brosian He worked for a time on a farm at Janer, and then returned to Breslan to study art, continuing his education at Jena Univ. and settling in Rome in 1883-1831. In 1888 he married and settled to literary work in Berlin. In 1891 he retired to schreiberhau, silesia. Lis first retired to schreibernau, Shesia. Lis histonotable play, Vor somenaufyang (*Befole Simirse', 1849), a ploneer of the movement towards realism reproduced the harshness and debasement of Silesian peasant life; this was followed by Emsane Menschen (*Louely People, 1891). and then came his most famous play, Die Weber ('The Weavers,' 1892), which dealt with the rising of the Silesian weavers in 1814 and was banned by the Licencer of Plays His much proised play, Die Versunkene (Hocke ('The Sunken Bell, 1896) is a poetic visionary dream not however devoid of external truth. Hannele, a drama on the fevered vision of a child, a Grama on the fovered vision of a child, was produced in 1894, followed by realistic social and historical dramss, including Fuhrmann Henschel (1898), and Der Rote Hahn ('The Scarlet Hen,' 1901). Ho wrote but few connectics, among them being Der Biberpele ('The Beaver Cape,' 1893). He was awarded the Grillparzer Delto in 1898 and \$1905 was made as 1939). He was awarded the Griffparzer Prize in 1898 and in 1905 was made an honorary LL.D. of Oxford Univ. His later work is allegorical in treatment, with experiments in the supernatural bordering on the irrational. In 1911 he wrote a religious novel. Der Narr in Christo: Emanuel Quint, and a long solemn pretentious philosophical poem, Till Eulenspiegel (1925), which represents a Ger. flying officer as prototype of the heroic Ger. character. In 1912 he was awarded the Nobel Prize for literature and he received many honours in Germany but his increasing submission to the Nazi regime adversely affected his subsequent work. Prolific and poetical and, con-sistently serious in all he wrote, H as a dramatist is too abstracely romantic and wanting in human warnth, and, though wanting in hillian warmth, and, though ho was early influenced by the realism of Flaubert, Zola, and Ibsen, the manifest trend of his outlook was speculative, visionary, and symbolical. See his autobiography Das Abenteuer memer Jugend, (1937), and study by E. Sulger-Gebing, 1909; also II. Marschan, Das Muteut bet Hauptmann, 1919 and H. Cysarz, Sieben Wesensbider. 1913. Wesensbilder, 1913.

Hauraki, gulf of the Pacific in North Is .. New Zealand, 70 m. long and 40 m. broad It has sev. excellent harbours, the tn of Auckland being situated on that of Waltemata, and it also contains many well-

wooded 19. A good outer breakwater is formed by the Great Barrier 19.

Hauran (Heb. chauran, the hollow land, so called from its numerous caves), dist in Syria, comprising the mountainous plateau extending in the E. from the Jordan and and sea of Therias. It consists of mt. ranges and large plains, with scattered eninences rising steeply from the valley of the Jordan to a height of about 2000 ft above the Mediterranca. It is full of the romains of anct cities and various monuments of the Gk and Rom The whole country is inhabited periods only by wandering Bedouins and a few colonies of Druses.

Hausas, Houssas, or Haussa, W African race, inhabiting a dist. of about 50,000 ag. in in the W and Central Sud in from the R Aiger to Bornu and including N. Nigeria. They represent a very high negro type, and have a strong admixture of Arab and Fula blood. The skin is very black, but the hips less that and the hard less woolly than in most negroes. I is men are of medium height, heavily built. and of great physical strength and endorance. Their language, which has a very wide range, is notable for its rich vocabulary. It belongs to the Hamitic group. and a large proportion of the words are connected with Arab and Semitic roots, thus tending to verify the native tradition that the origin of the race was beyond Mecca to the k The language, which has become a lingua franca over a wide are i has been reduced to writing, in modified Arable characters, by the natives them Arable characters, by the natives them selves, and there is a certain amount of native literature. contain symmetrically arranged inclusions (of other minerals, so that the precise composition of H. is not yet certain. Frank Rutley thought that H. and nosean (q.v.) were mere varieties of the same species and X-ray examination has revealed its essential identity with nosean, sodalite, and the artificial ultramarines. Lapis lazuli is a member of the same group. On heating in the blow-pipe H. melts to a glass, whilst noscan only melts at the edges; both, however, are gelatinised with acids. II. occurs in volcanic rocks and especially associated with nepheline and leucite. It is found in Mount Somma, Puy de Dôme, Mount Vesuvius, the Laacher See near Koblenz, and elsewhere.

divided into three distinct arms or bays, called Regla Bay, Guanabacoa Bay, and the bay of Atarés. The approach to H. from the sea is impressive, and beyond the surf-heaten coast the first con-spicuous objects to strike the eye are the historic Morro Castle, whose venerable fortifications command the narrow bottlenecked entrance to the harbour, and its tall lighthouse, orected in 1844 by Gover-nor-General O'Donnell. The Morro ('promontory'), erected on the left-hand side of the harbour, between 1589-97, is partly hewn out of the rock and partly constructed of solid blocks of rock, this Puy de Dôme, Mount Vesuvius, the giving it an irregular appearance. Its Laacher See near Koblenz, and elsewhere. It has occasionally been cut as a gemestone.

Havana, cap. of the is. of Cuba, and one of the most important seaport the. It landing was made on June 7 to the E. of was named by its founder, the Adelaninvested by land and sea, the Sp. fleet of twenty ships remaining in the harbour just as Adm. Cervera's ships were to do in 1898. The defence, after the Eng. had entered the fort, was gallant in the extreme, Velasco, the gov., being resolved to die rather than ask for quarter, and a battery to the E. of the castle perpetuates his memory. On the right is La Punta, another fort. Round the seaward side of another forc. Aboung the seaward said the city is the fine driveway on a sea-wall, called the Malecon, with its gardens and handsome bandstand. Beyond the Morro on the left are the heights forming an amphitheatre S, and W. of the city, some of the hills being 1000 ft. high and crowned the contract the c of the fills being 1000 ft. high and crowned with fortifications known as the Cabanus, built in 1763-74. The fortress 'Castillo del Principe' is entered by a massive gateway approached by a drawbridge. It was in this harbour that the Amer. cruiser Manne was blown up on Feb. 15, 1898, when 270 men and 2 officers were killed, this being the immediate cause of the Sr. American the Sp.-Amer. war. In 1912 the Maine was raised, towed out to sea and sunk. Many improvements have been effected in H. since the U.S.A. military occupation, notably in the way of wider thorough fares, better built houses, and general sanitation. Yellow fever, a very prevalent epidemic, was found to be caused beauty the title of the sanitation. through the sting of a mosquito (Slegomsia), and resultions were taken to

remove the cause of offence.

The chief trade of H. is the tobacco industry, and there are numerous cigar factories. Sigar is also one of the prin products. There is an extensive export trade in sugar, tobacco, clears, grape fruits, and other products. Trade is chiefly with the U.S.A., Great Britain, and trance. There are sev important public buildings, such as the Palace, the Exchange (El Mucble), and the custom-house. The handsome railway station of the United railways of Havana is near the S of the city where once stood the arsenal. of the city where once stood the arsenal.

A series of parks and avenues cross H.

from S. to N., following closely the
direction of the old walls. From Parque
Fraternidad, the Prado, or Pasco de
Marti, a boulevard of laurel trees, extends
to the Malecon. Farmy Central Park Me
the handsome Capitol, crowned by a
white dome, and the National Theatre,
which can sent an anglesce of 2000 which can seat an audience of 3000 Obispo (Bishop) and O'Reilly Streets, narrow and hydhy picturesque, and the chief shopping centres, run parallel to the old Presidential Palace in the Plaza de Armas. O'Reilly Street was named after the Sp. general who entered the city by it the Sp. general who entered the city by it while the Ring, left by Obspo Street when the city was given back to Spain at the end of the Seven Years' war. To the N. of the Plaza de Armas is La Fuerza, reputed to be the oldest fortress in the New World, and erected by Hernando do Soto in 1519. On its tower is the Habana, Soto in 1919. On its tower is the Habana, a figure emblematic of the city. On the W. side of the Plaza is the Cabildo (q.v.) or Ayuntamiento, or City Hall, in Sp. times the residence of the Captain-goneral. At the N.W. corner of the Plaza is the Supreme Court of Justice, once the resi-

dence of the archbishop and, later, the Senate House. The cathedral, dedicated to the Virgin of the Immaculate Conception, is near the junction of Empedicate and San Ignacio Streets. It was built in 1704 by the Jesuits, with twin towers and massive walls. H. has a National Library, schools of arts and trades, a fine univ. and sev. secondary schools, etc. H. is the terminus of the air-mail and passenger planes from the ILSA, and a station ger planes from the U.S.A. and a station for the air connection S.E. to Haiti. Central America, etc. It is the terminus of the chief railways of the is, and has an excellent steamship service with the leading Amer. and European ports. Pop. 673,300. The prov. of H. has a pop. of 1,235,900.

Havana, Declaration of, made by the Pan-Amer. Conference, July 30, 1940, vetoing the transfer of the colonial dependences of non-Amer. countries in the W. Hemisphere to other non-Amer. countries. The aim of the declaration was to prevent the seizure of Fr., Dutch, or other European colonies by Germany or Italy. The Conference arranged that if any transfer were attempted the possessions might be jointly administered by the Amer. republics, at least two-thirds of the republics participating, until such time as their definitive gov. should be decided by the free determination of their people. Any sudden attempt at seizure would be net by the U.S.A. acting in the defence of the continent of America. An other resolution recommended marketing agreements, including loans to producers. to keep stocks of S. Amer. commodities off the Ger. and Ital. mikts.—the agroe-ment to be financed by a 500 million dollar fund of the Amer. Import and Ex-

port Bank.

Havant, tn. of Hampshire, England, near the head of Langstone Harbour Near it is the is. of Hayling. It has brewing and tanning industries, and manufs, parchment. Pop. with Water-

Handlis, parchiment. Fop. wash water loo, 28,300.

Havel, riv. of Central Germany, rising in Lake Dambech, Mecklenburg, and flowing into the Elbo just above Witten burg after a course of 221 m. It is largely canalised and joined to other rivs. and lakes by canals.

Havelock, Sir Henry, (1795-1857), Eng. soldier, entered the army in 1815, and went soldier, entered the army in 1815, and went to Indu with the 18th regiment eight years later. He served in the Burmese war (1824-26), and was aide-de-camp to Sir Willoughby Cotton in the Afghan war of 1839. During the next years he rose steadily in his profession, and saw much active service. In the Indian Mutiny, dur-ing the last year of his life he went world. ing the last year of his life, he won world-wide renown. He captured Cawnpore and July, and was promoted maj.-gen.; and in the next few months effected the relief of Lucknow. A few days later he died. He had in Sept. been made K.C.B., and, before his death was known in this country, was created a baronet and granted a pension of £1000 a year. See life by J. C. Marshman, 1860.

LITER LTURE.

Haverfordwest, seaport of Pembrokeshire, S. Wales, on W. Cleddau R., 6 m. N.E. of Milford. It is a contributory parl, and a nouncipal bor, and a co. of itself, having a lord-lieutenant. There are coal-mines. The tn. was settled by the Flemings in the roign of Henry I. The Grammar School was founded in 1613; the parochial Grammar School was founded in 1818. Pop. 7000.

Haverhill, (1) Mill. tn. in Suifolk, England, on the borders of Essex and Cambridgeshire, 184 m. S.E. of Cambridge on the Hom. road known as the Via Devana. Few relics of antiquity are left in the tn.

Few relies of antiquity are left in the ta. as it was largely destroyed in a disastrous fire in 1665 in which the fine fourteenthdetermined in the line follocolding iffeculty-century par, church was much damaged; it has since been completely restored and enlarged. The manor house, now the vicasage, is of seventeenth-century date and contains some fine panelling. To the S.E. are some scanty remains of an earthwork known as Haverhill Castle. Two m. to the S. is Kedington with its church noted for its wonderful collection of tombs and fittings dating from the thirteenth to the nineteenth centuries. There are manufs, of ready made clothing (dating from 1784), heavy hand-made gloves, hair canvas for stiffening coats and fibre mets. Other industries are the manuf. of agric. implements and brushes, manuf. of agric. Implements and prushes, and there are also a rope works and a large flour mill. Pop. 4150. (2) City in Essex (o., Massachusetts, on I. b. of the Riv. Merrumac, 33 m. N. of Boston. It is connected with Bradford by a bridge. H. is the bp. of the poet Whittier, who was educated at the academy in the tn. The perm business of the place is the manuf. of prin. business of the place is the manuf. of

brin. business of the place is the maint, or boots and shoes. Pop. 46,700.

Haverstraw, vil. of Rockland co., New York, U.S.A., on the R. Hudson, 35 m. N. of New York, qverhung by limestone hfts. Pop. 5900.

Havildar (lindu haweldar), non-com-missioned officer attached to a native regiment in India. The rank corresponds to that of a sergeant in a European regiment.

Havre, or Le Havre, scaport in I rarce. is second in inportance to Marscilles. It is the cap, of the airon, in the dept, of Seine Inférieure, and is situated on the N. slue of the estuary of the Seine, being distint 113 m. from Paris, and 55 m. from Rouen. The larger portion of the tn. stands on the level ground surrounding the estuary, but the richer quarter is situated on the heights of La Côte. The basine or docks of Le Havre form a triangle in shape, and are entered by means of the Outer Port. There are nine basins, the oldest dating back to the seventeenth century. In recent years anseventeenth century. In recent years another new entrance was made by means of two breakwaters, whilst the Tancarville Canal germits riv.-boats to approach the port direct, without attempting the estuary of the Seine. The chief basin are the Basin Boliot, and the Basin de l'Eure. This port trades with all the chief European ports, with America, Africa, and the W. Indies, Its chief imports are cotton, woollen goods, silk,

wheat, sugar, and coffee, whilst its exports are Fr. manufactured cloths, wine and spirits, and agric, and dairy produce. H. is noted for mechanical engineering and is noted for mechanical engineering and shipbuilding trades. Its name was origin-ally Havre de Grâce, because a chapel was built in 1516, dedicated to Notre Dame de Grâce. The chief buildings were the hôtel-de-ville, the law courts, and the exchange, but these and other and the exchange, but these and other buildings were seriously damaged or destroyed in 1944. H. was used as a base and place for landing troops during the First World War, and the Belgian Gov. transferred their headquarters here. Trade, which had decreased since that War, had attained its previous standard prior to the outbreak of the Second World War.

H. was occupied by Ger. forces after the collapse of France in 1940. It was frequently bombed by the R.A.F. in 1940 and the succeeding years. It proved a thorn in the Allied side during the building of the invasion forces in Normandy, Ger. mine-laying aircraft and surface creft based on the northeing with ward on the northeing with ward or the northein ward ward ward or the northein ward ward or the northein ward or the craft, based on the port, being awkward enemies. Attacks by Ger. light coastal craft, such as 'E' and 'R' boats, based on II. and on Cherbourg were made by the Gers, with a persistence equal to that of their air mine-laying effort. After Cher-bourg fell a number of 'E' boats were sent to Brest, and the chief menare to the Allies then became concentrated at II., from which operations were directed primarily against Brit, anchorages. But successful attacks were made by Bomber Command against the docks, sinking a number of 'E' boats and other craft at their moor-ings. H. was cut off when the Albes had crossed the Seine (Aug. 1911), but the tier, garnson rejected an ultimatum to surrender on Sept. 1 and the city was then surrender on Sept. I and the city was then invested by the Allies. Attacks were supported by heavy aerial bombing during which more than 11,000 tons were dropped on the city, half this total being dropped on Sept. 10. On Sept. 10 also the linal ground attack was launched by the Brit. 19th Infantry Div. operating with the Canadian First Army under Gen. Crerar. This attack was supported by naval forces including the battleship II arante and the This action was supported by havai forces including the battleship it around and the monitor *Erebus*, which bombarded Gerintaliations with 300 rounds of 15-in. shell. By noon on the 11th the N. and E. outskitts of the city had been reached and by midday on the next day the city surrendered with its garrison of 7000 troops. The duninge done to the city was heavy and widesproud, churches and other historic buildings, including the three museums, being destroyed. Pop. 106,900, arron. 322,100.

arron. 322,100.

Havre-de-Grace, city in Hartford co., Maryland, U.S.A., on W. bank of Susquehanna R., 35 m. N.E. of Haltimore, Through it passes the Wilmington and Baltimore railroad, which crosses the Susquehanna by a steam-ferry. There are canning factories, flour and lumber mills. Pop. 4000.

Hawaiian Islands, of Hawaii, formerly the Sandwich Islands, form a ter. of the United States. They consist of a chain

of 20 is, in the N. Pacific Ocean between 18° 55′-22° 16′ N. lat. and 154° 4′-160° 30′ W. long., some 9 of which are inhabited. The inhabited is, extend for about 380 m. from E.S.E. to W.N.W., whilst the uninhabited ones continue the chain for meny hundreds of m. W.N.W. All the is, are of volcanic origin, and nearly all of them are surrounded by coral-reef. The names of the inhabited is, are Hawaii, Maui, with two smaller is, Kahoolswo and Lanni, Molokai, Oshu, Kauai, and Niihau. Hawaii Is, is in the shape of an irregular triangle, the sides of which measure 90 m., 75 m., and 65 m. shape of an friegular triangle, the sides of which measure 90 m., 75 m., and 65 m. This is, is the chief of the group, and it possesses the largest volcano in the world, the Mauna Loa (Great Mt.). This not have been the scene of many terrible cruptions, the last of which in 1907, was attended by an earthquake. The mt. has a huge rater, called Mokuaweoweo, and is 13,675 ft. high. The mt. of Kilauca crupted in 1924 and earthquakes have been numerous. A volcanic observators been numerous. A volcanic observatory is situated at Kilauca. Maul lies 26 m distant from Hawaii, and consists of two mts, connected by the isthmus Wailuku about 8 m long and 6 m, wide. The two correll to telegraphs and Lunnicated. apout a in long and o in, wide. The two
small is, Kalicolawe and Lanni afford
pasturage for sheep, and are private
property. The is, of Molakai has a
famous leper settlement called Kalawao,
which a ansula, shut off from the
rest of the is, by a rock wall, 2000 ft. high The is of Oalu is surrounded by a coral reef, and lies 23 m. from Molokai. It is very mountainous, with remarkably beautiful valless and tropical vegetation. There are set craters on the lower mismear the corst. The cap, Honolulu is situated on this is. The Federal Goy, of the 11% A. In fault to the restreet of the U.S A, to facilitate the protection of the Pacific coast and the control of the Panama Canal, constructed extensive naval works at Pearl Harbour, about 7 m. from Honolulu, and also military or m. from tronouna, and mass miners works at Honolulu and other places on the is. The div dock at Pearl Harbour naval station was opened in Aux. 1919 naval station was opened in Auz. 1919 Kaum 1s 63 m from Oahu, and has been called the 'garden isle' on account of its fertile ground. Nilhau completes the chain of inhabited is., and is remarkable for its coral reef in the W. and for the large salt lagoons in the S. For administrative purposes the Ter. of H consists of four cos. The is. of Oahu is known as the city and co. of Honolulu. The remaining cos, are Hawail (including the is of that name). Mant (including the is of

they owe their Christian religion and general education to missionaries (see DAMIEN, FATRER), the first to arrive coming from America in 1820. The pop is very varied, consisting of Europeans, Chinose, Amers., and Jap. The climate is exert to have the control of most salubrious, and the cultivation of the most sambrious, and the cultivation of the sugar-cane forms the chief trade. The la are very fertile and, hesides the sugar-cane, rice, pincapples, bananas, coffee and other tropical and subtropical products are largely grown. Valuable timber is procured from the vast forests. Ser lines of steamers connect the is, with America, Australia, (hina and Japan, and there is an inter is steam navigation comthere is an inter is, steam navigation company. There are telephones and whelestelegraphy, and Honolulu is lighted by electricity. Hawali has a supreme court and circuit courts, and elementary edu-cation is compulsory and free There is cation is compulsory and free There is a normal school and a univ. (founded in 1907). Pop. of the is by the cenus of 1930 was 384,336, an increase of 43 9

History -Captain Cook discovered the H. 1. in 1778 and named the group Sandwich is, after the fourth earl of Sandwich then First Lord of the Admiralty; but in 1779 lost his life in an unimportant encounter at Kealakekua Bay. Later some Brit, and other European sailors settled there, including two men, John Young and Isaac Davis, who became influential advisers to King Kamehameha I., called the Great, founder of the Hawaiian State and monarchy. The Hawaiians looked to Britain as their disinterested protector, as is shown by their flag devised early in as Is shown by their flag devised early in the last century and consisting of narrow bands of red white and blue with the Union Jack in the upper canton. Kamehameha died in 1819 and his successor, Kamehameha II., disturbed over the changes through the growing intrusions of white men, resolved to visit England for advice, and with his queen, Kamamalu, and Polynesian retinue, landed in England in 1824; but the rough pate both store. in 1824; but the royal pair both suc-cumbed to measles in London before their meeting with George IV. who, however, promised their followers that he would watch over their country. The Brit. Gov. then appointed Capt. Richard Charlton of the mercantlle marine to be its first Consular Agent for 'the Sandwich, Friendly, and collety Islands' to reside at Honolulu. Charl'on, after some years there, marked by sev. disputes, was suc-ceeded in 1843 by Gen. Wm. Miller, with maining cos. are Hawail (including the soft hat name) Mani (including the is of that name) Mani (including the is of Kanal), Kahoolawe, Lanai and all Molokan except its leper settlement; and Kanai (including the is, of Kanal), and Nilhau The Molokai leper colony, where Dannen (q.v.) worked between 1873–1889, constitutes a fifth co., Kakawao, which is controlled by the Board of Hospitals and Settlements. The Amer. President appointment made by Charlton. The Settlements. The Amer. President appointment made by Charlton. The points the Governor; there is a Senat of 15 and House of Representatives of 30 members; and the Ter. sends a delegate to Congress, at Washington.

The natives of Hawaii were cannibals in earliest times, but they became more civilized with the influx of other races, and

to establish a paramount influence in the is, as against other Powers; and such remained the state of offairs until the reignmained the state of affairs until the reigning dynasty ended with the death of Kamehameha V. in 1873. Meanwhile, in 1862, an Anglican bishop arrived in H. despite the opposition of the Amer. missionaries, and, in 1865, Emma, widow of Kamehameha IV.. and a grand-daughter of John Young and his untive wife, visited England as the guest of Queen Victoria. But notwithstanding these bonds with England, commercial and agrio, developments in H., combined with the enhanced local position won by with the enhanced local position won by the Amer, missionaries through land ownership and business interests, resulted ownership and blastices the results, removed in the United States acquiring the paramount influence in the is. In 1874 Kalakaya was elected king as the candidate in favour of Amer. annexation against the downger-queen, Emm i, who was supported by the majority of Hawaiians. forced by the majority of Hawahans, circut Britain opposed Amer, anneyation, but James G. Blaine (q.r.), Amer secretary of state, informed the Brit. Gov. in 1881 that sooner or later H. would have to come under Amer, protection, but that the state and the protection but that ome under Amer, protection, but that time did not arrive until the \(> n - Amer. \)
war, when America sought a stronghold and supply depôt in the Pacific. Howhich had been an independent native kingdom till 1893 and a republic from 1891-98, was formally annoxed in 1893 and became a Ter. in 1900. The post of Brit. Consul-General in the Pacific is now held by the Governor of Fin and high commissioner for the W. Pacific. A plebiscite held in the is. in 1940 on the issue whether the Ter. should apply for statehood resulted in a majority of two to one in favour of statehood which, if to one in favour of statehood, which, if accepted, would have made II, the forty-ninth State of the U.S.A. But in Dec. 1941 the Jap, launched their sudden and treacherous attack by plane and submarine on Pearl Harbour and II, thus bemarine on Pearl Larrour and it. the so-came a pawn in the world condict (see Pearl Harboth). By the summer of 1942 the Jap, had completed preparation for an atternat to capture Midway Is, as a stepping stone to an assault on H., but

the decisive Amer air-naval victory off Midway Is. (June 3-6, 1912) averted the danger for the rest of the war.

The pop. of the Ter. of H. is 525,140 (Honolulu Co. and city, 268,900; Hawaii Co. 73,800; Mauil Co. 35,100). In 1940 some 80,000 of the pop. were allow. The land seem in the is to

and in S. Airica (1895-90).

Hawker, Robert Stephen (1803-75), Eng.
poet and antiquary, b. at Stoke Damerel,
near Plymouth, Devonshire, eldest son of
J. S. Hawker, vicar of Stratton, Cornwall,
Educated at Cheltenham Grammar School and Peinbroke College, Oxford. In 1827
he carried off the Newdigate prize, was
ordained in 1831, and became vicar of
Morwenstow on the Cornish coast in 1834.
He laboured here for forty years, during
which period he rebuilt the vicarage, restored the church, and built a school. His
theological views were manust those of the theological views were mainly those of the tractarians. H.'s ballads were direct and simple in style and composed in the true spart of antiquity. None is better known simple in style and composed in the true sprit of antiquity. None is better known than his spirited balled based on the old Cormish refrain, 'And shall Trelawnos die ?' Other of his poetical pieces are Iendrils by Reuben (1821), Records of the 11 extern Shore (1822), Reeds Shaken with the Wind (1843), Quest of the Sangrael (1964), Footprints of Forner Men in Cornwall (1993). See S. Baring Gould, The Vicar of Morvenstov, 1875, C. E. Byles, Life and Letters of Robert Stephen Hawker, 1905; M. F. Burrows, Robert stephen Hawker: A Study of his Thought and Poetry, 1926; and M. Collin's novel, Sucet and Twenty, 1875, in which His character is delimented under the name of Canon Tremaine Canon Tremaine

Hawkers and Pedlars, itinerant dealer-engaged in the business of carrying their goods for sale from place to place. The trade is regulated under special supervision of the legislature, this being made necessary by the opportunities afforded dealers with no fixed domicile of evading responsibility and practising fraud. By the Act of 1871, a pediar is a person who sells articles, travelling without a horse or other teach. beast, and certificates are supplied, to those desirous of carrying on the trade of a pediar in good faith, by the chief officer of the police of the dist, for which they are asked. The Hawkers Act, 1988, defines a hawker as one who travels with a horse, or other beast, bearing or drawing a burden. A single act of selling does not constitute a pedlar, and persons who travel about seeking orders for goods, as agents, sellers

seeking orders for goods, as agents, sellers of fish, fruit, victuals, and exposing goods for sale in a public mrkt., do not come under the category. The feet for a pediar's certificate is 5s., and a hawker's heence can be taken out at a cost of £2.

Hawkes Bay, or Wairos, in New Zealand, N. Is., between Auckland and Wellington, on the E. coast. It is enclosed on the N.E. by Mahia Peninsula, and extends S. to Cape Mata-mawi, a total distance of about 60 m. In 1769 adm. in 1757. His chief fame was gained in 1759 after his attack on Marshal Con- Cook entered it in the Endeavour, and in flan in Quiberon Bay, which resulted in 1848 it was occupied by European-the destruction of the Fr. fleet, and the H. B. receives ev. considerable streams.

Hawkesbury, one of the chief rivs. of New S. Wales, Australia, flowing castward and formed by the union of the Nepean factories of Rivs. The united stream forms the N., W., and E. boundaries of Cumberland co., and, after a course of Edward Clarke, K.C., in The Story of My New S. Wales, Australia, flowing castward and formed by the union of the Nepean and Grove Rivs. The united stream forms the N., W., and E. boundaries of Cumberland co., and, after a course of about 60 m. eastwards, falls into Broken Bay. It is navigable for vessels of 100 tons, but is liable to great and rapid in-undations, produced by the fall of rain on the Bine Mts. Its banks consist of fine alluvial soil. In 1889 railway connection between Adolaide and Brisbane was completed by a bridge over the riv. Total length, 330 m. pleted by a bridge over the riv. length, 330 m.

Hawkesworth, John (c. 1715-73), Eng. miscellaneous writer of humble parentage, hin London. In 1744 he succeeded Dr. Johnson as compiler of the Gentleman's Macazine. In 1752 he started with Johnson and others The Adventurer. H. was son and others ine Aurentum. At the the editor, and of the 140 papers, wrote some seventy-two or so. In 1755 he pub. The Works of Jonathan Swift, with his-The Horks of Jonathan Swift, with his-torical notes and explanations, and pro-pared the account of Capt. ('ook's first voyage, forming part of his own pub., Poyages. He also wrote an eratoric, The Fall of Egypt (1774), sev. essays, and come plays.

'Hawkeye State,' see Iow 1.

Hawkhurst, par. partly in Kent and partly in Sus-ex, England, 12 m. N.W. by W. of Rve, by rall. Pop. 3000.

Hawking, see FALCONRY.

Hawkins, Sir Anthony Hope (1863-1933), Eng. author whose pseudonym was 'Anthony Hope'; second son of Rev. E. C. Hawkins, vicar of St. Bride's, Fleet Street. He began to write early, but it was not until he pub. The Polly Dialones (1894) that he became generally known. The best of his many books, are The Prisoner of Zenda (1894), The King's Virror (1899), Quisanté (1900), and The Prisoner of Zenda (1894), The King's Mirror (1899), Quisanté (1900), and Second String (1910). A master of dialogue, he designed a large portrait-gallery of interesting characters from music hall singers to statesmen. He Prisoner of Zenda added to the language a new adjective. 'Ruritanian,' whose use is to qualify modern gov. and to make it as like gov. In the Dark Ages as possible, for the sale of picturesurers. H. was the sike of picturesqueness. H. was knighted in 1918. His later work includes: A Young Man's Year (1915), Captain Diepne (1918), Beaumaroy Home from the Wars (1919), Lucinda (1920), Little Tager (1925), Memores and Notes (1927), His plays include The Adrentice of Luit Assistance of Park Later 1928. of Lady Ursula and Pilkerton's Pacrage, See Sir C. Mallet, Anthony Hope and His Books, 1935

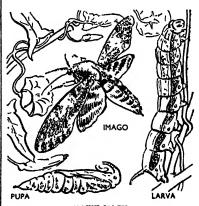

Hawkins, Sir Henry, Baron Brampton (1817-1907), Eng. judge, b. at Hitchm, Hertfordshire, and educated at Bedford School. In 1839 entered at the Middle Temple. Called to the Bar in 1843 and joined the home circuit and Hertfordshire. easions. Took silk in 1538, and for the next eighteen years was one of the most promin-ent leaders of the Bar. He was engaged in many in portant cases; his well-chosen language and lively intelligence succeeded in winning for him the verdicts of juries, In 1876 appointed judge of the High Court

Edward Clarko, K.C., in The Story of My Life (1918), severely criticises his conduct as a indge with some justification. The so-called Reminiscences of II., pub. in 2 vols. in 1904, contain some amusing anecdotes; but the vols. are clearly the work of the editor, Richard Harris, the witty Q.C. who wroto the very entertaining Hinis on Advocacy (ith ed.), 1880.

Hawkins, or Hawkyns, Sir John (1532-95), Eng. seaman and naval commander, b. at Plymouth. While quite a volung man he made sev. voyages, and was the first Englishman to traille in slaves.

the first Englishman to traffic in slaves. the first Englishman to traffic in slaves. In 1573 be was made navy treasurer, and knighted as a reward for his services against the Armada in 1583. In the mustering of the Eng. fleet to defend the country against the Spaniards, H. was capt. of the Victory. While at Plymouth he served under Drake, and was a member of the council of war. In 1594 he served in an expedition, ordered to the W. Indies under the command of Drake, to the Sp. Main, but died at sea off Porto Rico. He left one son. Sir Richard H. also a naval Main, but died at sea of Porto Rico. He left one son, Sir Richard H., also a naval commander. His True Declaration of the troublesome royadge of M. John Hawkins to the parties of Gunna and the West Indies, was pub. in 1,369.

Hawk-moth, species of Lepidoptera belonging to the family Sphingide, sometimes also known as 'sphinx-moth,' the

HAWK-MOTH

name being derived from the resemblance shown in the caterpillar stage to the Egyptian Sphinx. The mother belonging to this family are all large and dull coloured, with a long proboses, a small hinder pair of wings, and long and pointed body. The caterpillars are smooth and stripod, and usually furnished with an erect horn at the hinder end. Allied species are the privet H., the pine H., the deathshead moth, and the hummingbird H.

bird H.

Hawkshaw, Sir John (1811-91), Eng. Engineer, b. at Leeds in the W. Riding of Yorkshire. He constructed various docks, Holyhead Harbour, the Severn tunnel (1887). Charing Cross and Cannon Street reilway stations and bridges, and part of the Underground Railway of London. He was for a time engineer to the Manchester and Leeds Railway; and later on to the Lancashire and Yorkshire Railway. Hawksmoor, Nicholas (1661-1736), Eng. architect, b. at E. Drayton, Nottinghamshire, and at the early age of eighteen obtained employment under Sir Christopher Wren. He became deputy-surveyor of the works at Greenwich Hospital in 1705

the works at Greenwich Hospital in 1705. Through Wren he obtained the post of clerk of the works at Kensington Palace, an office which he held till 1715. He also assisted Wren in the erection of St. Paul's Cathedral from its commencement to its Cathedrai from its commencement to us completion in 1710. Under Sir J. Van-brugh he was also assistant surveyor at Blenheim Palace, Oxfordahire (1710–15) At Oxford II. was employed from an early period, and much of his work is seen there at the different colleges. At the close of Anne's reign he took a large part in the building of fifty new London churches. See H. S. Goodhart-Rendol, Auholas Hauksmore 1921.

Hawkweev, or Hieracium, genus of plants of the natural order Composite They are a perennial species of herb, characterised by yellow, orange, or rid flowers. The orange H., a native of Europe, is frequently cultivated in gardens. by reason of its handsome blooms. The plant is very hairy, having a tuft of oblong leaves at the base. It is quite a pest in the meadows and pastures of New York state, and can only be overcome by cultivation.

Hawkwood, Sir John de (d. 1394), Eng soldier and captain, b. at Sible Heding solder and captain, 0, at side fielding ham in Essex. He won both renown and riches as a condottiere in Italy, where he was known as Grovanni L'Acuto. He distinguished hunself at Crécy and Potters and was knighted by Edward III. From 1363 onward he fought in the It. wars on different sides, and was finally persuaded to fight the battles of Florence for an ann. persion. See J. T. Leader and G. Marcotti's life trans. by Mrs. Leader Scott), 1889.

Hawkyns, Sir John, see Hawkins.
Hawkyns, Sir Richard (c. 1542-1622),
Eng. naval commander, son of Adm Sir
John H. He served under Drake, and
took part in the defeat of the Annada
(Aug. 1588) and in the subsequent descript on the Portuguese coast in 1590. Three on the rortuguese coast in 1590. Three years later he sailed in the Dainty on a voyage round the world. He touched Brazil, passed the Straits of Magellan, and took and plundered Valparai-o, but was defeated and wounded after a hard fight in San Mateo Bay, and imprisoned in Spain till 1602, when he was ransoned and knighted. Later he became vice-saim of

pirates (1620-21). See his Observations on his Voyage into the South Seas, with biography by Sir C. R. Markham, 1878.

Haworth, moorland vil. and par. in the W. Riding of Yorkshire in the Keighley div., 9 m. N.N.W. of Halifax. It has an area of about 10,540 acs. Charlotte Brontë, the novelist (1816-55) and her sisters resided here from their earliest years, and descriptions of the moorland scenery are to be found in their novels, notably Wuthering Heights, by Emily Bronte. The old church of H. has been ruthlessly demolished, but the graves of Charlotte and Emily Bronte are in the churchyard. The parsonage, where they lived, is now the Brontë museum. Pop. 6000. 6000.

Hawthorn (O.E. haga-, hag-, or hege-thorn), genus of shrub or small tree be-louging to the species Crategue, numbering about fifty, bearing fruit resembling in ministure that of the apple, and therefore belonging to the natural order Rosaceæ, with spiny branches and alternate, simple or lobed leaves, smooth and shining. The flowers are sweet-scented, white, with a sometimes reddish tinge, and grow in flat-topped clusters. The H. is a native of the N. temperato regions, especially America, and is represented in the Brit. Isles by the H., whitethorn, or may. It thrives best in dry soils, and may be propagated from

seeds or cuttings.

Hawthorne, Nathaniel (1801-61), novelist, is by common consent the greatest of all Amer. writers of fiction. He was b. at Salem, Mass., July 4, his ancestors being among the first settlers. Educated at Bowdoin College in Maine, he there met and won the friendship of H. W. Longfellow, afterwards to become celebrated as fellow, afterwards to become celebrated as one of the greatest Amer. poets. His best-known works are Twice-Told Tales (two ceries, 1837, 1842), Mosses from an Old Manse (1846), The Scarlet Letter (1850), The House with the Seven Gables (1851), The Bithedale Romance (1852), and The Marble Faum (1866). While his earlier work won the praises of the critics, it secured for the author no recognition from the public which was first attracted to his books. lic, which was first attracted to his books when he pub. The Scarlet Letter, a story of New England in the seventeenth century. The admirable picture of the place and the spirit of the age, the tragic story so well unfolded, was at once acclaimed as the mast rpiece it is still acknowledged to be. It is dark and gloonly, as a tale of human frailty and sorrow must be, and it would be painful to read were it not that the author so clearly shows that there is light beyond. Admirable as are H.'s other books, and especially The House of the Seren Chibles, The Scarlet Letter stands apart, and above, all his works. Must of his fiction deals with the problems of evil and sin and their devastating effect upon human empsignee. In large measure a sort masterpiece it is still acknowledged to be. voyage round the world. He touched Brazil, passed the Straits of Magellan, and brazil, passed the Straits of Magellan, and took and plundered Valparaiso, but was defeated and wounded after a hard fight in Sân Matoo Bay, and imprisoned in Spain till 1602, when he was ransomed and knighted. Later he became vice-adm. of Devon and second-in-command in Sir Robert Mansell's fleet against the Algerine Nathaniel Hawhorne, A Modest Man

1940; L. S. Hall, Hawthorne, Actor of Society, 1944.

Hawtrey, Sir Charles Henry (1858-1923), king. actor-manager and playwright; son of the Rev. John H., an Eton master. H. was first and foremost a racing man, but he achieved success both in England and he achieved success both in England and in the U.S.A. as a first-class comedian, Took leading parts in: The Man from Blankley's; The Private Serretary: The Little Damozel: The Naked Truth: Inconstant George: General John Regan; and Ambrose Applicion's Adventure:
Hawtrey, Edward Craven (1789-1862), headmaster and provost of Eton College, act Unwhen near Eton.

headmaster and provost of Eton College, b. at Burnham, near Eton. Entered the school, with which his family had been connected for nearly 300 years, in 1799. See life by T. Thackeray, 1896.

Hay: (1) Mrkt. tn. and par. in Broconshire, Wales, 20 m. W. of Hereford, on the Wye, and 12 m. S. of New Radnor. Pop. 1300. (2) Post tn. and cathedral city of New South Wales, Waradgery co., in the middle of the Riverina dist., 70 m. N. of Deniliquin. Pop. 3000. (3) A riv. of Alberta, Canada, devcending from the E. side of the Rocky Mts., and flowing into the Great Slavo Lake, 350 m. in length, and navigable for 140 m.

and navigable for 140 m.

Hay, Sir George (A. 1456), Scottish poet and translator. In youth, in France, chamberlain to Charles VII. Returned Returned chamberlain to Charles VII. Returned about 1445. He resided with earl of Cathness and made trans, from Fr. for him. The prose consists of three books dealing with battles, chivalry, and princes' duties; found in MS. in the library of Sir Walter Scott. The poetry also is a translation from the Fr.—20,000 Scottish verses called The Rules of the Scottish verses, called The Buke of the Conqueror Alexander the Great.

Conqueror Alexander the Great.

Hay, James (d. 1636), Brit. diplomat, accompanied James I. to England. Became earl of Carlisle, the first Scotsman to be created an Eng. peer. His previous litles were those of Baron II. and Viscount Doncaster. The king employed him in sev. embassies, notably to France to negotiate a marriage between the Prince of Wales and the Princess Henrietta Maria.

Hay John (1838-1035) Anier, states.

Hay, John (1838-1935), Amer. statesman and author, b. at Salem, Indiana. He was one of the private secretaries to President Lincoln, 1861-65. In 1879-81 he became first assistant secretary of state. In 1897, on the inauguration of President McKinley, H. was appointed ambassador to Great Britain, becoming ambassador to Great Britain, becoming subsequently secretary of state. After the war with Spain of 1898, he directed the peace negotiations. Among his most notable achievements were the Hay-Pauncefote treaty (q.v.) with Great Britain in 1901, and the settlement of the Alaskan boundary dispute between the U.S.A. and Canada in 1903. He pub.: Pike County Ballads (1871), of which the most famous are 'Little Breeches' and 'Jim Bludso'; 'Castlian Days (1871); a vol. of poems (1890); Abraham Lincoln (1890) in conjunction with G. Nicolay, etc. See Addresses of John Hay, 1906; Letters from John Hay and Extracts from Miss Diary, 1908; W. Thayer, The Life and Letters of John Hay, 1915.

Hay and Ensilage. Hay is composed of the stems and leaves of grasses, mown and dried for use as fodder. The object of the farmer in haymaking is to preserve the hay for winter use in a condition most nearly resembling the grass in its natural state, so preserving its nutritive value. To ensure this, the mowing should be done when the plants contain the largest amount of cinter aggregated for the superior of amount of gluten, sugar and other soluble matter; this occurs when the grava is in flower. For the operation of mowing, dry sunny weather is required. After cutting, the gravs is tedded, that is, shaken evenly abroad over the ground, on the first day, and afterwards put into small heaps, or cocks, for the night. On the second and third day the same process is applied and if the weather has remained propitions, the hay should then be ready for stacking. A haymaking or 'ted-ding' machine, drawn by a horse, is adopted for use on a large farm. The following table gives the average constituents of clover hay and meadow hay of average quality; percentage in each

.	Clover	Meadow hav
Dry matter	. 83.0	84 .00
Nitrogen	. 2.40	1 . 50
Mineral ash Phosphoric	. 7.00	6.50
acid .	. 0.57	(1 + 10
Potash .	. 1.50	1-60

The hay crop in Great Britain and Ireland for the new years 1926-30, averaged 13 million tons, and in 1946 it was almost million tons. The production per acre in 1914 was 1.15 tons, in 1928-39 2.1 tons, and in 1946 2.4 tons (see olso GRA94 LANDA).

Ensilage is the name given to the practice of preserving green food for cattle in 'silos' or pits. The practice of 'caching' stores, etc., in such pits is very old, but it was not till comparatively recent years that the idea of using them for the procervation of fodder was carried out. The 'silos' used should be at least 15 ft. deep. and both air-tight and water-tight; an erection above the ground is sometimes used instead of a pit. Crops which are suitable for endlage are grass, clover, vetch, oats, rye, malze, etc. Englage forms a wholsome and nutritious food for cattle, and a very good substitute for root crops. Cows fed on enslage give quite as good milk as when fed on any other variety of fodder, and it is calculated that a larger number of cattle can be supthat a larger number of cattle can be sup-ported on a certain area by the use of en-silage than by the use of green crops. See S. F. Armstrong, British Grasses and their employment in Agriculture, 1937. Hayangs (Ger. Hayingen), tn. of France, in the dept. of Moselle, 16 m. N.N.W. of Metz, on the R. Fensch. There are iron-mines and metallurgical industries. Pop. 10 200

mines and metallurgizal innustries. Pop. 10,300.

Haysseoa, Jorge, see ECHEGARAY Y ELIZABURRE, JOSK.

Hayashi, Tadasu, Count (1850-1913), Jap. statesman, b. at Tokyo; sent to England by the Tokugawa Gov. among the first batch of students. He had much

HAYDN

Haydn, Joseph (1732-1809). Austrian composer, on of a vil. whoelwright at Rohrau, Austria. At the age of twelve he became a chorister at Vienna, receiving at the same time some instruction in the violin and planoforte. After studying under Porpora, he produced with great success, when only twenty years old, his first opera. The Denil on Two Sucks (1752); this was followed by a set of trios and his first important quartet, all of which earned the usual censure of pedantic critics for 'contrapuntal errors,' and 'daring innovations.' In 1758 ho met Prince Antony Esterhazy, and two years later was appointed leader of his excellent orchestra. He remained under the family's patronage for thirty years, during which time he composed a prodigious quantity of orchestral and chamber music, some operas, and also the music to the 'Seven Words on the Cross,' afterwards brought out as an oratoric in 1801. On the death of Prince Nicholas Esterhazy ess, nee Hayes, Catharine (1890–1726), murder-the death of Prince Nicholas Esterhazy ess, nee Hall, b. near Birmingham. She (1790), H. accepted Salomon's invitation

to do with the modern rise of Japan, and igured in the revolutionary movement. He obtained office in 1871, and rapidly rose to the front rank: serving as vice-minister of foreign affairs; and then being appointed to represent his country—first in Poking, then in St. Petersburg, and finally in London. He was created viscount for his services in negotiating the first Anglo-Jap. War he remained in London. He returned to Tokyo in 1906; and was created a count in 1907, for services performed during the Russo-Jap. War. In Vienna, and before long it had travelled was created a count in 1907, for services performed during the Russo-Jap. War. In Vienna, and before long it had travelled round half Europe. Three years later he roduced his last important work, a splendid setting of a version of Thomson's and was author of For His People (1903). did setting or a version of Thomson's Seasons. H. was a composer of amazing fecundity; in addition to the 120 symphonies, he left twenty operas and eighty quartets, and a vast number of concertos, trios, and sonatas, wherein he developed with admirable symmetry the sonata form of Emanuel Bach. He was the first to detach music from religious the first to detach music from religious ceremonial and to give it a purely secular significance as an absolute art, and his music is the expression of a nature at once genial, devotional, warm, and vivacious, See lives and studies by C. F. Pohl, 1875-1882 (completion by H. Botstiber, 1927). J. Cuthbert Hadden, 1902; K. Geiringer, 1948; Rosemary Hughes (Master Musicians), 1950.

Haydock, tn. in Laucashire, England, 31 m. E.N.E. of St. Helens. Has extensive collieries and iron foundries. Pop 10.500.

Haydon, Benjamin Robert (1786-1816). Eng. painter, b. at Plymouth, England, chiefly noted for his historical paint-ings. A man of indomitable high-flaming energy and industry and full of a conviction of his own power, which, however, was not justified. But the most distinguished spirits of the time were among his friends, especially Keats. He suffered a heavy disappointment in the rejection of his historical cartoons for the decoration of the new Houses of Purliament. Among his works are: 'Christ's Entry into Jerusalem' (now at Philadelphia), the fruit of six years' labour; 'The Raising of Lazarus'; and 'The Judgment of Solomon' (in the National Gallery). H.'s lifelong struggle with debt so preyed upon his mind that he became unable to paint, and died by his own hand. Probably his chief title to the regard of posterity was that he was mainly instrumental in get-ting the pre-eminence of the Elgin marbles among the works of the sculptor's marners among the works of the sculptor's art acknowledged in the teeth of hostile cliques, and their acquisition for the nation secured. See S. Colvin, Keats. 1887; G. Paston, R. R. Haydon and his Friends, 1905; and E. George, The Life and Death of Benjamin Robert Haydon. 1948.

Haydon Bridge, eccles. par. in North umberland, 6 m. N.W. of Hexham. It has smelting works, 'Tron and bras-foundries, and coal and lead mines. Pop

age of sixteen, and soon after they left Birmingham they set up a small shop in Tyburn, taking in lodgers. With the help of two of them—Wood and Billings—she murdered her husband in March 1726, and was arrested a few weeks later. At the trial she pleaded 'not guilty,' but was convicted and sontency if a he burnt. was convicted and sontenced to be burnt. Wood and Billing, were hanged. See W. M. Thackersy, Catharine in Fraser's Magazine, 1839-40.

Hayes, Catherine (1825-61), Irish presents, and helled (1825-61).

Magazine, 1839-40.

Hayes, Catherine (1825-61), Irish operatic and ballad soprano, b. at Limerick. She studied at Dublin, and frequently appeared at concerts there In 1842 she went to Paris, where she studied under Manuel Garcia, and on his advice proceeded thence to Italy, where she was engaged at the It. Opera House. In 1849 she came to England and made her début at Covent Garden in Linda di Chamauni.

Chamouni.

Hayes, Isaac Israel (1832-81), Amer. Arctic explorer, In 1860 61 he conducted an Arctic expedition, and eight years later another, fully described in his work. The Land of Desolation (1871). He

work, The Land of Desolution (1871). He also pub. An Arctic Boot Journey (1860), and The Open Polar Sea (1867).

Hayes, Patrick Joseph (1867 1938), Amer. cardinal; b. in New York, son of Daniel H. Graduated Manhattan College, 1883. Priest, 1892. Chancellor of New York, 1903. D.D., Rome, 1904 Pres., Catholic College, 1903-14. Domestic prelate to Pope, 1907. Auxiliary Bishop of New York, 1914. Rector, St. Stephen schurch, Oct. 1915. Catholic chaplain-bishop, U.S.A. Army and Navy, 1917. Archbishop of New York, 1919 Cardinal 1924. 1921.

Hayes, Rutherford Birchard (1822-93), nineteenth President of the U.S.A. He graduated at Kenyon College, Ohio, in 1842, and practised law in Cincinnati from 1819 to 1861. At the outbreak of the Civil war in 1861, he was appointed may of a volunteer regiment, and saw active service in Virginia. He retired as a maj.-gen. In 1865 he was elected as a congressman from Ohio, and was governor of that state in 1867, 1-69 and 1875. In 1876 the Republicans nominated him for President against the Democratic nonness, the re-form governor of New York, Samuel J. Tilden (q.v.). As President H. stood like a rock against the corruptionists, devoted a rock against the corruptionists, devoted his efforts to reforming the civil service system and the resumption of specie payment. He left the White House as he entered it—an honest, hard-working public servant. See W. D. Howells, I ife of R. B. Hayes, 1876; and J. Q. Howard, Life, Public Services, and Select Speeches, 1876.

Hayes, (1) Urban dist. of Middlesex, England, 13 m. W. of London. Munufs. aircraft, grainophones and printing presses. Pop. (with Harlington), 54,700, (2) Vil. of Kent, England, 2 in. S of Bromley, with a large common. Wm. Pitt, the younger was born here and his gramophones and father, the earl of Chatham, ded here. Pop. 5000. Hay-fever, condition of discomfort, which occurs about the time of hay har-

vest. It is characterised by running of the nose and eyes, from irritation of the nose and air passages by grass pollent, chiefly coming from Timothy grass June grass, orchard grass, sweet vernal and meadow foxtail. In severe cases strict or absolute avoidance of the hay crop or other cause is necessary. As, howor other cause is uccessary. As, however, the attack is either induced or aggravated by want of tone in the system, benefit always results from alteration of the mode of life and attention to minute details of hygiene. But prevention is more important than cure. The nose and air passages are benefited by local applications, such as douches of boric acid, alum, common salt, sprays containing ephedime. Good results follow accine treatment when it is begin early. Having regard to the troublesome nature of the condition, it is advisable to have the nose examined for physical defect-which may be amenable to treatment. Hayingen, see HAYANGE.

Hayle, small scaport to. of Cornwall, England, on St. Ives Bay. The harbour has a depth of about 11-20 ft. at high water. Tin mining and smelting are carried on. Pop. 916.

carried on. Pop. 916.

Hayles Abbey, ruins of a Cistercian
Abbey, situated 2 m. N.E. of Winchcomb
and 10 m. N.E. of Cheltenham, Gloucestershire, England, at the foot of the Coiswolds. The abbey was founded in 1216
by Richard, earl of Conwall and king of the Romans, brother to Henry III. In 1270 the mouls were presented with a plual containing the 'Blood of Hayles,' which attracted numerous pligrims until the dissolution of the monasteries. Only a few walls, and notably some of the pointed bays of the cloisters, are now remaining, but the foundations of the great church have been carefully indicated by the planting of yew hedges. There is a museum containing a collection of bosses, early tiles, and other relies of the abbey.

Hayley, William (1715-1820), friend and biographer of the poet Cowper, b, at Chichester; educated at Eton and at Trimty College, Cambridge. Studied law for a short time, but abandoned it for a life of literary case. Ho won fame by his life of literary case. He won fame by his An Essay on History, etc. (1780), An Essay on Painting (1781), An Essay on Epic Porty, etc. (1782) and his poom in six cantos, The Triumph of Temper (1781). His most memorable work is his Life of Couper (1803 01). It also wrote plays, a number of works in prose; lives of Milton (1796) and Romney (1809). His own Venours were pub. in 1823.

Hayman. Francis (1708-76), Eng.

Hayman, Francis (1708-76), Eng. painter, b. at Exeter. Worked as a scene-painter at Drury Lane Theatre. Also became known as a designer by his illustrations to Sir T. Hanner's ed. of Shakespeare, and for Congreve's poems, Smollett's Don Quixole, and the Spectator, 1747. He occupies an important place in Eng. art as one of the founders of the Royal Academy.

Haymarket Square Riot, riot in Haymarket Square, Chicago, 1886, in which seven policemen were killed and sixty

wounded by a bonth when dispersing an anarchist meeting. A number of an-

archists were hanged.

Haymarket Theatre, London theatre standing in the Haymarket, opposite Charles Street, and, next to Drury Lane, the richest in theatrical tradition. During the patent monopoly it was a kind of chapel of ease or training-house to Drure Lane and Covent Garden. It was built in Lane and Covent Garden. It was built in 1720, and leased to a company of Fr. actors, who opened it with La Fille a La Mode. Fleiding's is the first great name connected with the theatre. In 1730 he produced the Tragedy of Tragedies, or Tom Thumb the Great, and became manager in 1731. Ten years later, Charles Macklin opened the Haymarket with a company composed chiefly of his own pupils. In 1747 it was rebuilt and Samuel Fronte assumed the management, and in pupils. In 1747 it was rebuilt and Samuel Foote assumed the management, and in 1766 he obtained a patent for the theatre during his lifetime. Foote sold the Hay-market to Colman the Elder in 1776, who continued to manage it till 1791; and m 1820 Harriss became manager and demoli-bed the old house, the sito of which is now occupied by the Café de l'Europe Ho crected a new theatre a little farther N., which was opened in July 1821 with The Rivals. A larger and uner building, under the same name, was built in 1850. ander the same name, was built in 1850, at which e 'orgo number of plays have been produced. Some of the successful plays in recent years have been The Impossible II oman (1914), General Post (1917). The Freedom of the Seas (1918), Under Sam (1919), The Young Person in Pink (1920), the exquisito fantasy of J. M. Barrie, Mary Lose (1920), the stirring Dover Road (1922), The Man with a Lond of Mischief (1925), and Eden Philipotts' Yellow Sands (1926), The Ivory Dow (1929), by A. Milne; The First Mrs. Fraser (1929), by St. John Ervine, Ten Minute 11th (1934), The Amazing Poetor Clutterhouse (1937), Thesign to Living (1939), Present Laughter and This Happy Bread (1943), Lady Windermarc's Fam (1947), The class Menagene (1948), Many notable performances of Shake Many notable performances of Shake Sussex, England, on the Siregion railway, speare have taken place at the H., and in at the function of Lewes branch, 12 m. N. 1931 Hamlet was produced at this theatre, of Brighton. The largest cattle sale in with an all-star cast including Fay Comp. Sussex is hold here. Pop. 5300. with an all-star east including Fay Compton. Irene Vanbrugh, and Godfrey Ton, Irene Vanbrugh, and Godfres Tearle. In 1918 the theatre was bought by the New Zealand Gov. See W. Mac-Queen Pope, Haymarket. Theatre of Pofection. 1948.

Haynau, see HAINAU.

Haynau, Julius Jakob, Baron von (1786–1853), Austrian gen., b. at Kassel Entered the Austrian army in 1801, and saw much service in the Napoleonic wars, being wounded at Wagram. Between 1816 and 1847 he rose to the rank of field marshal lieutenant. He fought with di-tinction in the It. campaigns of 1818-49 tinction in the It. campaigns of 1848-49 but showed ruthless severity at the capture of lirescia. In 1849 he was called to Vienna, and took supreme military command in Hungary, where, as in Italy, he was accused of brutality. Ou the restoration of peace he was appointed dictator of Hungary, but resigned in 1850. See life by C. von Schönhals, 1875.

Hay-Pauncefote Treaty, treaty negotiated by John Hay (q,v) on the part of the U.S.A., and Lord Pauncefote on behalf of Great Britain, abrogating the Clayton-Bulwer Treaty (q,v), and providing for the construction of a Panama Canal (q,v) under U.S.A. control and for its neutralisation on the same basis as lis neutralisation on the same basis as Sucz Canal. When submitted to the Senate in 1900 it was ratified, but with such amendments, especially regarding its neutralisation, that Great Britain refused to ratify them. A further treaty was negotiated in 1901 and passed by the Senate. It domanded no guarantee of neutrality, although the general principle of neutrality of the Clayton-Hulwer Treaty was retained, and in time of war the U.S.A. were given certain rights of control not definitely specified.

Hayward, Abraham (1801-81), Eng. miscellaneous author, was called to the Bar in 1838, and though he never acquired a considerable practice, he was made Q.O. in 1845. He wrote in the Edunburgh, the Onarlerly, and Fraser's Magazine on many subjects, and his Essays (of which there are three series, collected 1858, 1873, 1871) are distinctly interesting. He wrote against the theory that Sir Philip Exercise was lumber in the start for the series and the series of the Francis was Junius in More about Junius (1863); in 1861 he ed. the autobiography of Mrs. Piozzi. His best-known book is on

of Mrs. Plozzi. His best-known book is on The Art of Dining (1852). His Correspondence was ed. by H. E. Carlisle in 1886. Hayward, Tom (1871-1939), Eng. circkoter; hrst played for Surrey co. in 1893. In 1896 he scored 3518 runs, a world's record which was not besten until 1947 by D. Compton and W. J. Edrich. His highest score, 315 not out, was made against Lancashire in 1898. He scored 104 centuries in first class cricket and over 13,000 runs. He appeared in many test 13,000 runs. He appeared in many test matches against Australia, and coached

to Benares, picturesquely situated on the high central plateau of H. dist., which contains sev. coalitelds and tea plantations. There are hot springs in the vicinity. was formerly a place of considerable importance. It is on the E. Indian railway.

Pop. 18,000.

Haze (A.-S. hasu, heasu, grey, but origin of word uncertain; some suggest Ger. hassen, to hate, from the disagreeableness of such weather), lack of transparency in the air; viz. obscurity, dim-ness. II. has the appearance of vapour or smoke with little or no dampness, and impedes the vision to a certain extent. It is often due to great heat. H. is really an obscuration of the atmosphere near the surface of the earth, caused by an infinite number of minute particles of vapour in the air. At one time the word was applied to a thick fog or hoar-frost, but is now only used for that thin, must vappearance in the air which makes all objects look indistinct and uncertain. H. is less determinate than mist or fog.

Hazebrouck (Flemish, Marsh Hares), arron., com., canton, and tn. of France, in the dept. of the Nord. on the canal of the same name. It has a trade canal of the same name. It has a trade in gram, butter, scap, etc., and manufallinen, cloth, and gingorbread. Being the central railway junction of Fr. Flanders, H. was held with tenacity by the Brit. forces during the First World War. During the Ger. drive of 1918, Merville, only 5 m. from H., fell to the Ger. on April 11, in the Lys battle, and the next day the lar bear a department to. Ger. began a dangerous movement to-wards H., which on April 12 was as near capture as Amiens had been during the crisis of the Somme battle of the preceding March. So serious was the menace that preparations were made for flooding the approaches to Dunkirk and Calais, and Haig, much against his heart, ordered a withdrawal from the hard-won ridges of Flanders taken the previous autumn. But the Brit. troops rose to the occasion, and on the 13th the remnants of the fumous 29th Div., together with those of the 31st

Corylerc. The common H., of which the fruit is a nut, is distributed throughout Britain and all the temperate parts of Europe, Asia, and N. America. Commonly found in hedges and copplex, reaching a height of about 12 ft. The leaves are alternate, and the male flowers arrows in alliquided authors while the appear in cylindrical catkins, while the female flowers are mere clusters of coloured styles at the extremity of the buds. number of varieties are cultivated ex-tensively in Kent around Maidstone.

See Katharine Authony, The Lambs, 1918.

Head. The human body is obviously and lighter of

separable into head, trunk, and limbs, of which the first is naturally divided into skull and face. Vertebrates possessing a bead are termed Craniata, the higher types of which have the hard bony case of the skull containing the brain, which is continuous with the spinal cord, while the dorsal and ventral, and in a comparison of the head with the trunk it will be found that in the former the dorsal tube is large relatively to the ventral. This condition relatively to the ventral. This condition is reversed in the trunk. The head is also remarkable on account of the large number of organs of special senses which it con-tains, such as those of smell (nose), taste tonging, such as those of smell (100s), taste (tonging), sound (ear), sight (toye) (see under those headings), hence there is no necessity to enlarge here on the vital character of this part of the human body.

Development.—In the embryo the distinction between the head and struck here.

tinction between the head and trunk by the formation of a cervical constriction is a change of comparatively late occurrence. though long before this constriction appears the characteristic features of the parts have become apparent. At first the head may be said to consist wholly of the cranial part; the face being developed later from a series of out-growths or bar-

of the cranium.

or the cranium.

Head, Sir Edmund Walker (1805–68), governor-gon. of Canada, b. near Maidstone, Kent. Educated at Winchester and at Oriel College, Oxford. Made Poor Law Commissioner in 1841, and lieutenant-governor of New Brunswick in 1817. In 1851 ho became governor-general of Canada, which position he retained till 1861, when he returned and was made a civil service commissioner and Privy Councillor in the course of a few years. He ed. F. T. Kugler's Handbook of Spanish Painting (1854) and pub. Ballada and other Poems (1868).

Head, Sir Francis Bond (1793-1875), Brit. soldier, traveller, and governor of Upper Canada, b. at Hermitage, Kent. Entered corps of Royal Engineers and served at battles of Waterloo and Fleurus. In 1825 was placed in charge of an associain 1823 was placed in charge of an associa-tion formed to work the gold and silver nines of Rio de la Plata. In connection with this work made sev. rapid journeys over the Andes and across the Pampas, described in his Journeys across the Pampas (1826). Appointed governor of Upper Canada in 1835, but resigned office two years later, and in 1833 was created a largonet. The rest of his life was devoted. haronet. The rest of his life was devoted to literary pursuits. Among his pubs. are: Bubbles from the Brunnen of Nassau (1834), A Faggot of French Sticks (1852), The Royal Engineer (1869).

Headache is present at the commencement of all fevers and many other diseases. When persistent, it may be due to tumour, or other changes in the brain. The term H. is often used to include neuralgia, or pain due to the nerves or nervous structure, as the eye, when it may be relieved by appropriate glasses to correct the otherwise fairly normal vision. H. may also be caused by the fact that the glasses akuli and face. Vericipates possessing a laso be caused by the fact that the glasses head are termed Cranicia, the higher types of which have the hard bony case of the skull containing the brain, which is continuous with the spinal cord, while the coupled by the mouth and pharynx, into the kidney and heart. Ordinary Hs. often appear in the form of megrim or latter of which the upper end of the head is affected, or the pain

is greater in one half than in the other. I masters of thirty-seven of the leading They are frequently accompanied and relieved by vomiting, and the pain is prevented by modifying the diet or adding prevented by modifying the diet of adding evacuation by laxatives or purgatives, or so treating the accompanying aniemia that the digestion is better able to put to a good use the food supplied to it. As the digestion is apt to be upset by worry, quarrels, vitiated air, railway and air journeys, and sea voyages, precautions should be taken when these risks are likely to be incurred. The use of bymostics and to be incurred. The use of hypnotics and drugs is not unassociated with risk, and it is better not to take them, except under medical advice.

Hs. in early life are often a symptom of other diseases which may declare them-selves later. Every effort, therefore, should be made to remove the cause from which they originate. When no organic trouble can be found, chronic or recurring Hs. may be due to an anxiety state arising out of hidden fears and emotional conflicts, which can be resolved by

psychiatric treatment.

Head-hunting, or Head-snapping, custom once prevalent among all Malay races, but now rapidly dying out, of obtaining and treasuring the heads of their enemies. Even to-day it survives among the Dyaks the both to the E. tribes, e.g., among the natives of the Solomon is. Writing of the Solomon islanders in 1893, H. Cayley Webster says, 'These natives are not only head-hunters and cannibals, but make no secret of it whatever... and when apparently on the most friendly terms are only awaiting a favourable opportunity to eatch the stranger unawares, and to add one more head to their already huge collection.' (Through New Guinea and the Cannibal Countries.) It is believed to have had its origin in religious believed to have had its origin in religious motives, the worship of skulls among the Malays being universal, and it is said to have existed in the Philippine Is. in 1577. The chief examples of head-hunters are the Was, a hill tribe on the N.E. trontier of India, and the Nagas and Kuhus of Assam. Severe repressive measures, however, have led to the decrease of the custom. See C. Bock, Headhunters of eustom. Ser Borneo, 1881.

Headmasters Conference. In 1869 the
Rev. Edward Thring, headmaster of Uppingham School, invited the head- Health Act, 1919, to exercise in England

schools of England to meet at his house and form a School Society which should have an ann. conference on educational nations. A small body of men attended the first meeting, but the society gradually developed and was incorporated in 1993 there were 140 members in England, five in Scotland, four in Ireland. two from the Channel Is., and one from the Isle of Man, while thirty members were Overseas—seventeen of those were in Australia. All the leadmasters have in Austrain. All the neadmanters have charge of large public schools closely connected with Oxford and Cambridge, to which many of the students pass from these schools. At the Conferences such varied subjects are discussed as the training of teachers, the discontinuance of compulsory Ok. at Oxford and Cambridge, noxious literature, and sports associations.

Headmasters, Incorporated Association of, founded 1890, incorporated 1894. The association has exerted itself to place before the educational authorities and the public at large the issues raised by the organisation of secondary education under central and local authorities. To be qualified for membership it is necessary to be a headmaster of a boys' day-school, such school coming under the category of secondary schools recognised by the Ministry of Education, and controlled by a body of governors who have power to appoint and dismiss the headmaster, and to control the school's finances. Many of these members have seats on the educational committees of co. conneils, and the association has estab, a scheme for the awarding of co. council scholar-hips. The membership is very large, with more than 700 headmasters on the list. The address of the Association, as of that of the Association of Assistant Masters in Secondary Schools, is 29 Gordon Square, London, W.C.1.

Headon Beds, one of the series of Brit. strata occurring in Hampshire, the Isle of Wight, and Devonshire, England, A variable series of clays, marls, sands, and limestones, the upper div. is of fresh water, the middle partly marine, partly fresh water, and the lower of fresh and brackish water origin. II. B., as well as Hamp-stead, Bombridge, and Osborne Beds, belong to the Oligocene system, and strata formed during the epoch between

Rocene and Miocene times.

PUBLIC HEALTH; SANTRATION, etc.
Health, Bill of, see Bill Of Health,
Health, Board of, an administrative
body of the Privy Council: estab. early in the last century for the regulation of the sanitary conditions of life, prevention of infectious diseases, epidemics, etc. Its jurisdiction is now exercised by the Ministry of Health (q.e.), Health insurance, National, see Nation-

AL INSURANCE.

Health, Ministry of. This dept. of state was created by the Ministry of

and Wales powers with respect to public attainment of health health and local gov.; and to it were and active co-operation accordingly transferred by the Act: public are of the utn (1) all the powers and duties of the Local Gov. Board, and the Insurance Commisgov. Doard, and the insurance Commission, (2) the powers of the Board of Education relating to the health of expectant and nursing mothers and of children under five, and to the medical inspection and treatment of children and young persons. (2) all the norms of the Inspection and treatment of matter any young persons; (3) all the powers of the Privy Council and of the lord president of the Council under the Midwives Act. Responsibility for the National Health Insurance and the Widows', Orphans' and old Age Contributory Pensions schemes was transferred to the Ministry of National Insurance in 1945. The main National Insurance in 1945. The main administrative divisions in the M. of H. deal with (a) local government organization and finance; (b) housing; (c) general practitioner services and mirsing; (d) hospital services; (e) local authority health services; (f) local authority welfure services; (g) mental health services; and (h) water supplies and sewerage. The analogous Scottish dept. Is the Department of Health for Scotland in Edinburgh. Health, Organization. World, the inter-

ment of Health for Scotland in Edinburgh.
Health, Organisation, World, the International hody charged by the United Nations with responsibility for all the international aspects of health. The constitution for the organisation was signed on Jul 22, 1946 by sixty-one nations (two others agreed at a later date and the U.S.S.R. withdrew), whose governeognised that those problems of health which seems of larger purply national most which are no longer purely national must be solved by international action and on a world-wide basis. In the previous halfcentury a number of international health organisations were built up, none of them organisations were built up, none of them complete but all serving useful purposes. The constitution of the W. H. O. embodies the experience gained by those organisations but goes further in an attempt to help all mankind to a higher standard of living. The principles which the sixty-one nations held as basic to the happiness, harmonious relations and security of all peoples are as follows. Health is a state of complete physical, mental and social wellbeing and not merely the absence of disease or infirmity. The enjoyment of the highest attains.

The enjoyment of the highest attainable standard of health is one of the fundamental rights of every human being without distinction of race, religion, political belief, economic or social condition. The health of all peoples is fundamental to the attainment of peace manaments to the attainment of peace and security and is dependent upon the fullest co-operation of individuals and States. The achievement of any State in the promotion and protection of health is of value to all. Unequal development in different countries in the promotion of lattice and countries in the promotion of

Informed opinion attainment of heath. Informed opinion and active co-operation on the part of the public are of the utmost importance in the improvement of the health of the people. Governments have a responsibility for the health of their peoples which can be fulfilled only by the provision of adequate health and social measures.' The international quarantine measures. The international quarantine measures to prevent the entry of, e.g., yellow fever, into the United States, of smallpox into Britain, are administered by W. H. O. Another important activity of the organisation is to establish international standards for drugs, sera and vaccines. Another function of the body is to draw up a commun technical language for up a common technical language for doctors in all countries. In order to corry out these talks the W. H. O. are guided by expert committees. At the first meet-ing of the assembly of the W. H. O. the following subjects were regarded as being at the moment the most sulfable for international action: the control of malaria, an extensive programme to cut down the spread of tuberculosis; the control of ceneral diseases; and assistance for governmental services for maternal and child health.

Health, Public, see Public Health.
Health Resorts, places frequented by
the healthy in order to keep healthy, or
by the diseased in order to regain health by the diseased in order to regain health or to check the progress of the disease. For the health, such resorts may be roughly divided into seaside and countryside dists, where the pure air and the generally more active outdoor life suffice to refresh mind and body. H. R. for the diseased are classified according to the conditions they are intended to cure. Consumptives frequent places at a high altitude, such as Davos Platz and Andermatt, or dists, where the climate is mild and the Riviera S. David Platz and Andermatt, or dists, where the climate is mild and equable, as at Bournemouth, Torquay, and the Isle of Wight in England, and the Riviera, S. Italy, Algiers, Egypt, S. Africa, and S. California. Many H. R. depend on the constitution of certain mineral waters, which are commonly regarded as of curative value in specific diseases. Special organisations and physicians of specialised experience probably have more to do with such cures than the actual chemical constitution of the waters. See BALNEOLOGY.

Health Service, National, see NATIONAL

HEALTH SERVICE.
Healy, Timothy Michael (1855-1931), Healy, Timothy Michael (1855-1951), Irish politician, lawyer, and governor-general, b. at Buntry. He was called to the Irish Bar in 1884, became a Q.C., 1899; in 1903 he was called to the Eng. Bar, and was a bencher of Gray's Inn, and of King's Inn, Dublin. A member of und of King's Inn, Dublin. A member of the property in the States. The achievement of any State in the promotion and protection of health in different countries in the promotion and of King's Inn. Dublin. A member of is of value to all. Unequal development in different countries in the promotion of the independent Nationalist party in the health and control of disease, especially communicable disease, is a common danger, Healthy development of the child is of basic importance, the ability to live harmoniously in a changing total onvironment is essential to such development. The extension to all peoples of the benefits of medical, psychological and related knowledge is essential to the fullest Expelled in 1900 from the Nationalist Party for his opposition to the United Irish League, but taken back in 1908, and then again driven out in 1910. Retired from politics in 1918. Became governor-general of the Irish Free State, serving 1922-27. A witty and humorous debater and forensic orator. He is the author of A Word for Ireland (1886), Loyalty plus Murder (1884), Why there is an Irish Land Question (1881), Letters and Leaders of My Day (1928). See L. Eng. author, son of the late Prebendary H. J. Heard, educated at Sherborne and Cambridge Univ. Literary editor of the Realist, 1929. Provocative writer on the modern world's problems. Bracketed by Sir R. W. Livingstone with G. B. Shaw, H. G. Wells and Aldous Huxley as one of our modern 'Sophists' (Plato: Selected Passages). His Science in the Making (1935) is one of the most fascinating and instructive books of recent years on the instructive books of recent years on the instructive books of recent years on the problems which beset a changing world and the degree of achievement of true progress. His Science Front (1937) is a stimulating survey of the march of science. Other works: The iscent of Humanity (1929), The Social Substance of Religion (1931), The Emergence of Man (1931), This Surprising World (1932), Exploring the Stratosphere (1936), These Hurrying Years—an historical outline of the years 1900–1933 (1931), Pan, Sex, and Time (suggests a remedy for present ills, 1939), The Creed of Christ (1911), The Code of Christ (1943), The Doppelgangers, (1919). (1919).

Hearing, the result of the stimulus of the auditory neurons by impulses set up in the auditory nerves. See EAR.

Hearn, Lafcadio (1850-1904), Eng.

author, was b. in Leucadia, one of the Gk. Ionian Is. His father was an Irishman, Surgeon-Maj. Charles Hearn, stationed in Leucadia at the time of the Eng. army occupation, and he married a Gk. woman. Being a Rom. Catholic, he sent his son to Ushaw College in Durham, but the boy was not happy there. He was tormented by a morbid self-consciousness by reason of his sallow skin, myopic eyes, and general foreignness to his surroundings. He had foreignness to his surroundings. He had also begun to rebel against the religion in which he was brought up. At the age of nineteen he ran away, and in some way, never explained, managed to reach the U.S.A. He secured a post as reporter on the New Orleans Times. U.S.A. He secured a post as reporter on the New Orleans Times Democrat, writing queer poetic pieces about old Creole days and songs. His paper commissioned him to visit the W. Indies, where he spent two years, principally in Martinique. The fruits of this were gathered in his book fruits of this were gathered in his book for conveying the dead to the grave; Two Years in the French West Indies, publishing house of Harper and Brothers commissioned him to go to and sixteenth centuries fis. of great

Japan. After writing a few articles fer their magazine, he soon let his contract drop, and decided to settle in the country. drop, and decided to settle in the country. He felt at ease among the Jap. He became a prof. of Eng. at the univ. of Tokyo, and wrote vol. after vol. about the country of his love. Among them were: Glimpses of Unfamiliar Japan (1894), Out of the East (1895), Kokoro (1896), Gleanings in Buddha Fields (1897), In Ghostly Japan (1899). All of those were distinguished not only by a delicate and unoccidental appreciation of the country, its peoples, its customs and legends. but its peoples, its customs and legends, but were also clothed in a very beautiful silvery prose. Hearn married a Jap. woman, took the name of Yakumo Kolzumi, became a Jap. citizen, and adopted the Buddhist faith. Then began littlestorrent. adopted the Huddhist faith. Then began disillusionment. As a Jap. citizen he was no longer treated with the consideration he had enjoyed before. The last years of his life were marked by Illness, and he lost his position in the univ. of Tokyo. His book, Japan, an Attempt at Interpretation (1904), showed that his eyes were beginning to opened to realities. See Milton. ning to be opened to realities. See Milton Bronner, Letters From the Raven, and Elizabeth Bisland, Life and Letters of Lafradio Hearn, 1906.

Lafardio Hearn, 1906.

Hearne, Samuel (1745-92), Eng. explorer, b. in London. He entered the Hudson Bay Company and examined parts of the coast of the Hudson Bay N. of Fort Churchill (then Fort Prince of Wales) in order to extend its trade area. In 1769 the company sent him on an expedition to discover some valuable copper mines which the Indians reported as existing and to a scretain whether there was a sea upon the N. shores of America which would connect the two oceans. After two attempts in 1769 and early 1770, he set out again in Dec. of that year and accomplished both objects, besides learning the fate of James Knight (q.v.), the explorer from the land of the F-quimaux. See Hearne's Journal, pub. posthumously

in 1795. Hearne, Thomas (1678-1735), Eng. antiquary, b. at Littlefield Green, Berk-shire. He graduated at St. Edmund Hall, Oxford, in 1699, whereupon he was appointed assistant keeper of the Bodleian Library, and in 1712 became second keeper. He was obliged to resign this office in 1716 on his refusal to take the oaths of allegiance to George I., which likewise prevented him from holding other academic positions. His chief works other academic positions. His chief works are: Reliquiæ Bodicianæ (1703), A Collection of Curious Inscourses upon English Antiquities (1720), and cd. J. Leland's Hinerary (1710-12), and Collectanea (1715) Margaret Roper, Life of More (1028), and numerous old chronicles. See his autobiography in the Lives of John Leland, Thomas Hearne, and Anthony & Wood, 1779

or brass, with a canopy and rich hangings, lighted by countless candles. They were erected in the churches over the bodies of

erected in the churches over the bodies of distinguished persons.

Hearst, William Randolph, one of the greatest newspaper owners in the world, was b. in San Francisco, California, U.S.A. in April 1863. Ills father was George Hearst, a California pioneer, who made a fortune in silver mines and served in the United States Senate from his state from 1886 to 1893. The son went to Harvard Univ. from 1882 to 1853 and while there became far more interested in journalism than in academic studies. Went to work on the San Francisco Examiner, and by on the San Francisco Examiner, and by 1887 had gained entire charge of it from his father, the owner. H. experimented with the paper, and reached the turn conviction that the new journalism must include great black sensational headlines, many illustrations and comic cuts. At this time Joseph Pulitzer and his New York World were the prin. exponents of the newer journalism. But H. took from the World staff some of its best people by offering much higher salaries. One of the famous characters in the Hearst comic strips was called the 'Yellow Kid.' Hence the term applied to his new-papers—Yellow Journalism. He vigorously supported Bryan for the presidency in 1896 and 190', and Wilson in 1912 and 1916 As much as anybody, H. pushed the United States into its war with Spain in 1898. On the other hand, he vigorously opposed America entering the First World War, and he also fought America's entering the League of Nations. He was originally a Democrat in politics, serving two terms as Congressman from the 11th New York Dist., 1903—7. He unsuccessfully ran for mayor of New York city on a municipal ownership ticket in 1905, and in 1906 ran for governor of New York state, being supported by the Independence League and by the Democrats. In recent years he has been an independent offering much higher salaries. One of recent years he has been an independent in politics, often supporting Republican candidates. He has built up a vast chain of newspapers.

Heart. In the various animals, this is

the important propulsive structure concerned in the blood circulation. In some invertebrates there is no H., e.g. Acrana such as Amphioxus (see Cephalochoro-LATA), while in others, such as insect-there is an elongated segmented organ, situated dorsally; in the lower orders (e.g. the Earthworm) it is morely represented by a higher development of certain blood vensels. In the vertebrates it is situated y. The comparative anatomy of ventrally. The completed subject, and only the H. is a complicated subject, and only a brief reference can be given here. In fishes it resembles the N-shaped form of the human embryo, and in most cases it is concerned in the propulsion of deoxygenated blood through the gills, where it becomes oxygenated. In amphibia a development of the lungs has resulted in a three-chambered structure, having one ventricle and two auricles. In the rep-tiles a ventricular septum is commencing, and is almost complete in the crocodiles.

magnificence came into use, made of iron | In birds the organ is four-chambered, but or brass, with a canopy and rich hangings. | lacks development to the extent that the incks development to the extent that the chords tendines (see below) are missing from the right auriculo-ventricular valve. In mammals there is, in general, a close correspondence with the human form, though in the lower orders the structure is placed less obliquely. The ossification of some of the fibro-cartilage tissue about the base of the great vessels of the H. is seen in the Ungulates, e.g. the os cordis of

The human H, is a hollow muscular organ, more or less conical in shape, situated in the thorax between the two lungs. It is found to be flattened in lungs. It is found to be flattened in transverse section, and in its natural condition it is roughly equal in size to the closed fist of the individual, i.e. in the adult it appears to be about 5 in. long, 3½ in. in its greatest width, and 2½ in. thick, but it is subject to considerable variations in different persons, and even to variations at different times in the same subject. The ratio of H. weight to body weight is normally about 'to' 't appearing is 22 c.c., approximately, in the new-born infant, from 150 to 160 c.c. the new-born infant, from 150 to 160 c.c. the new-born infant, from 150 to 160 c.c. in a youth of sixteen years of age, and increases rapidly for the next ten years, and more slowly later, reaching about 290 c.c. capacity in a male aged fifty, while in the case of a female the capacity is some 25 c.c. less. The H. is enclosed in a strong membranous sac (the pericardium), and is situated between the breast-bone and the costal cartilages. It breast-bone and the costal cartilages. It has a very oblique position in the chest, the base being directed upwards, backwards, and to the right, and extending from the level of the fifth to that of the cighth dorsal vertebra. The stroke of the H. is most perceptible about 3 infrom the middle line of the sternum, and about 1½ in. below the left nipple. The error contains a longitudinal partition organ contains a longitudinal partition, dividing it into a right and a left half, transverse constrictions further sub-divide its interior into four chambers, viz. the right and left auricles and the right and left ventricles. The exterior is marked by a deep transverse groove, the auriculoventricular furrow, and by two longitudinal furrows, roughly corresponding to the internal septum and constructions. In the furrows will be found the coronary In the furrows will be found the coronary arteries and veins which are concerned with the blood supply of the H.'s component structures. Lymphatic vessels and nerves embedded in fatty tissue and covered by a layer of the pericardium also occur. This pericardium is a dense fibrous mantle of two layers which enclose the pericardial cavity. The outer and inner layers present smooth serves surinner layers present smooth scrous surfaces to one another and secrete a pericardial fluid which acts as a lubricant

Cavities.—The auricles (so named from a fancied resemblance to an ear Lat. auris), which are situated at the broad upper base of the H., are thin walled cavities acting as reservoirs for the blood. The posterior part of the right auricle receives the ven.e cave, the superior being above and the inferior below, and the remains of the Eustachian valve, a relic of footal circula-

tion, will be found attached to the right and lower margin of the orifice of the inferior vent cava. The right auricular appendage overlaps the root of the roots, and has in front of the superior ven reava The thousand valve separates the light auricle from the right ventricle, which pyramidal chamber has much stouter walls than its corresponding auckle pulmonary aftery is in communication with the light ventricle, though a vilve in the form of three with pockets, or cusps, closes the opening into this artery at certain stages of the carduc cycle lach cusp of the vilv has a small know (Corpus Aranti) in the in idle of its curved edge, and the three Il see fit back tube liber hollows (sinuses of value) and the artital tube liber hollows (sinuses of value) and the hollows (sinuses of value) ensure that when the value is fully relaxed, the blood shall have an un interrupted passage into the effection vessel. The left auricle receives the blood shall have a tuber of the statement of the stat vessel The left auricle receives the blood from the pulmonary cent: it passes the noe into the left ventricle, which in this direction is unobstructed by the mitral valve (so called from its resemblance to the bishop's cap of that name). The left ventricle is the stoutest walled of the four chambers, as its contractive force must propel the blood throughout the whole of the body.

Cardiac cycle and the circulation —This cycle of activity comprises (a) the simultaneous contraction of the auricles, followed by (b) a simultaneous contraction of the ventricles The former occupies about one third of the time of the latter, and the two contractions are termed systole of the H I hey are followed by a agatole of the H help are followed by pause, diastole, which occupies a period of time roughly equal to that of the complete systole. The whole cycle is repeated about sevent, five times per min During the contraction of the suricks the mass of blood contained in the large veins prevents blood contained in the large veins prevents regurritation and the total contents pass into the uncontracted ventricles. The valves, which have been slowly closing during the filling of the lower chambers, are completely closed on the commencement of the ventricular systele. The valve sections are seen inner in shape, and are composed of cudothellum, strengthened by enclosed fibrous trisue, the two cusps of the mittal valve are unequal in size. He shely columns (muscular) applicusps of the milinivalve are unequal in size kloshy columns (muscular) papillar(s) support strong tendinous cords (chordec tendino 1), which are attached to under surface of the valve flaps and prevent those from being forced into the interior of the auricle during the ventil cular systole. I from the left ventrice the bright real events the being forced that the bright red oxygenated blood from the pulmonary vein is forced into the aorta pulmonary vein 14 forced into the corra with its three custed valve accombling that of the pulmonary artery it is estimated that a 1 worklele propole forward 3\frac{1}{2} cubic in of blood during each systole, and the tel it work of the H in twenty four hrs 1s equivalent to 120 ft tons. The fatal circulation is different from that described in issuit in selections. from that described, in ismuch as there is direct communication between the two auricles by means of a large opening (formen ovale) in the intrauricular septum, the cycle in this case is right auricle, left surfice, left ventrice to maternal placents, and so on

Smads -H complaints are frequently diagnosed by auscultution or the listening to the H s sounds by means of a suitably applied stethoscope These sounds in a apping attended to the country in a health adult will consist of a length dull cound followed by a short ship sound, and resemble look lub look lub, and so on, the former 14 probably (a seed by the contraction of the muscular ibres of the ventucle and the tension of the auxiculo ventucular valves, the latter is due to the sudden closure of the semilunu valves on the completion of the ventricular systole

H disease may be detected by irregularities in these sounds

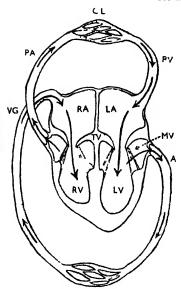

Detailed structure—The main substance of the organ is composed of muscular tissue (myocardum), with a certain amount of interstitial arcelar tissue conamount of interstital arcolar tissue con-taining numerous blood vessels and lymphatics, together with nerves and gangila in certain areas. At the base of the li , beneath the pericardium, there is usually a considerable amount of fat. Fibrous tissue and fibrous cartilage occur at the large orifices at the base of the ventricles. A previous reference has been made to the cessification of this in certain animals. The inner surfaces of the H. cavities are lined by a smooth membrane termed the *endocardium*. The muscles are involuntary, but differ from the usual form of these in being striped. The exact arrangement of the fibres is very compli-cated, and but little understood (reference should be made to recent treatises, as Cunningham's Anatomy), but, in sum-mary, there appear to be common superficial fibres for the two auricles and the two ventricles, and separate deeper fibres for each cavity. Recently, fibre bundles (bundles of His) have been traced connecting auricle to ventricle, the function of which is, presumably, to transmit the impulse of contraction from the auricle to impulse of contraction from the surfice to the ventricle; if these bundles are damaged, the ventricle contracts very slowly, at its own natural rate, and the condition is spoken of as 'heart block' (see Stokes' Adams' disease, below). Nervous system.—The nervous control

of the organ is tripartite, and consists of cardiac nerves derived from the cervical ganglia of the sympathetic system, from ganglia in its own substance, and also gangia in its own substance, and also from the pnoumogastric or vagus direct from the brain; this last system appur ently exercises an arresting power on the H.'s action, whilst the sympathetic nerves have the opposite effect, of speed-

ing up the rate of heat.

Discases.—The H. or its investing membranes may be the seat of man different form. I disease.

Pericarditis is the inflammation of the pericardium, and is usually accompanied by an excessive effusion of fluid into the restaudial seature. pericardial cavity; this may seriously affect the mechanical action of the Il Endocarditis, or the inflammation of the lining membranes of the H.'s cavities, may be caused by acute rheumatism, and may result in serious injury to the valves, usually those of the left side. Valvular damage usually causes murmurs, and these sounds are tested by auscultation, and in this manner a narrowing of the valve orifice (stenosis) can be distinguished from an incompetence of the valves. An acute ulcerative endocardits is due to mero-organisms, and is usually fatal. Myo-carditis, or inflammation of the muscle substance, may take one or more of set. forms, and result in serious permanent trouble, e.g. fatty degeneration. All these complaints, together with derangement of the cardiac nerves or disease of the coronary vossels, result in a demand for extra work on the part of the H. liseli, and this usually results in hypertrophy of the muscle until compensation is estab. This, in its turn, may result in premature senility through mainutrition. Cardiac dilatation and other complaints may be consequents of influence. Palpitation, which may be due to digestive frouble, and is then caused by direct impulses from the stomach, must not be confounded with tachycardia in which the H.'s action is permanently accelerated as during exophthalmic goitre. Bradverse during exophthalmic goitre. Bradvicardiogram, of these impulses is cardia, or the slowing of the rhythm, may be due to cerebral tumour, melancholia, laundios, etc., in the form of Stokes' Adams' Disease, or a senila degenerative a separate place from the body. It

change appearing to lead to a weakening of the conductivity of the common deepseated anriculo-ventre ular muscle bundles. Congenital malformations of the H. are not unknown, e.g. the foramen orale, instead of closing up as normally occurs at stead of closing up as normally occurs at birth, may remain open, so that purplish deoxygenated blood leaks from the right side of the H. to the left, whence it is pumped round the body; a sign of this complaint is cyanosis (blueness) of the face, especially on exertion. The usual treatment for many forms of H. disease endeavours to ensure a maximum of rest tor the patient, and a minimum of excitement, both mental and physical; where necessary digitalis and strychnine are administered as cardiac tonics. The conadministered as cardiac tonics. The contraction of the H. muscles (as also of other muscles in the body) is accompanied by electrical impulses which can be amplified and rendered visible on a serven by mean of the electrocardiograph. A photograph (electrocardiogram) of these impulses is valuable for the diagnoses of H. diseases. See also Angina Protoriis.

Heart Burial, the burial of the heart in a satisfact place from the heart in

appears to have been practised by the anct. Egyptians, and was not uncommon in Europe during the twelfth and thirteenth centuries. The custom probably arose out of a veneration for the H., which was regarded as the seat of a man's affections and conscience and was associated with his soul. It was forbidden by Boniface VIII. (1294-1393), but his prohibition was withdrawn by Benedict XI. The heart of Richard I. was buried in Rouen Cathedral, and that of Edward I. at Jerusalem. Other notable instances of H. B. may be cited in the cases of Henry III. in Normandy, James II. in Paris, Robert Bruce at Melrose Abbey. the Fr. kings. Louis IX., XIII., and XIV. Francis I. and II., Philip III., etc., and the Emperor Leopold of Austria. Shelley's heart cor cordium, was sent home to appears to have been practised by the to provide relief for members during sickthe Emperor Leopold of Austria. Shelley's heart cor cordium, was sent home to Bournemouth, and Byron's was huried in the mausoleum at Missolonghi in Greece. The heart of the Marquess of Bute was buried in Jerusalem as late as 1900; that of Thomas Hardy (q.v.) at Stimsford, in 1928. Separate burial was sometimes given to other parts of the body. The viscera of the popes have been buried in the church of the Quirinal since the time of Sixtus V. (1590). See T. J. Pettigrew, Chronicles of the Tombs, 1857; and Emily Hartshorne, Enshrined Hearts of Warriors and Illustrious People, 1861.

Heartburn, the common name for a

Heartburn, the common name for a burning sensation in the chest, often accompanied by a feeling of discomfort in the throat and in the region of the heart. It is due to gastric disturbances, and is generally caused by irritation of the atomach wall by hyper-acidity of the gastric contents. The cardiac symptoms, when present, are generally due to an over-distended stomach interfering with the heart's action. The discomfort it rapidly relieved by a dose of blearbonate of soda. The condition should be treated by ensuring a simple diet, regular exercise, and regular action of the bowels. Charcoal and bismuth are also very useful drugs

for H.

for H. Hearth-money, tax of two shillings imposed in 1662 on every hearth in all houses except cottages. The principle was an old one, for in early Eng. hist an A.-S. king obtained part of his revenue from a funage, a tax on the hearth smoke of all his subjects but the very poor. The tax of Charles II,'s reign was exceedingly unpopular, and was withdrawn in 1689, a window-tax being levied in its stead in The idea is also apparent in the

hearth penny-tax paid annually to Rome as early as the tenth contury.

Heart of Midlothian, old Tolbouth or gaol, pulled down in 1817, of Edinburgh, the cap. of Midlothian, which gives its same to one of Section pouled.

name to one of Scott's novels.

Heart's Content, seaport and tn. of Newfoundland, situated on the Avalon Peninsula, 40 m. N.W. of St. John's, on the E. coast of Trunity Bay. It is the terminus of three Atlantic cables from Valentia is Ireland. Pop. about 1500.

Heart's-ease, see Panny.
Hearts of Oak, large friendly society founded in 1842, the objects of which are

ness, and for members' wives during confinement, to insure the tools and implements of trade of members against loss or damage by fire, and to provide sums at the death of a member and for funeral expenses. The society also defrays the expenses of residence of members in convalescent homes and sanatoria. Special facilities for house purchase are afforded by the society to members and others. The membership is 423,000 and the funds, including reserves, amount to £17,665,000. The society's offices in Euston Road, London, were opened by King Edward VII. in 1907.

Heat, general term applied to that branch of physics that deals with the effects produced by heat on material bodies, with the laws governing the transference of heat from one body to another, with the physical nature of heat, and with the transformations of heat into other forms of energy. The term H is used in ordinary language in a number of different senses, of which the following are the most common: (a) sensation of H.; (b) temp, of degree of hotness; (c) quantity of H.;

(d) radiant II.

(a) The sense of II, is distinct from that of touch, for the former sensation is experienced if we sit in front of a fire, or in the sun, or in the neighbourhood of any the sun, or in the heighbourhood of any hot body, and is, therefore, not dependent on actual contact with matter. It is from this sense of H. that we get our first ideas of H. as a physical entity which is capable of passing from one body to another.

(b) If a hot iron is placed on a cold iron plate, we may observe by a sense of H. that the plate is heated and the iron cooled until they both attain the same degree of warmth. From the sense of H. we derive the idea of a continuous scale or order, which we express as summer H., blood H., red II., etc., and we speak of the temperature of a body as denoting its place in the scale as distinct from the quantity of H. it contains.

(t) The quantity of H. in a body must

(f) The quantity of H. in a body must depend on its size (and also, it should be added, on its material). The temp, on the other hand, does not depend on the size of the body, but on the quantity of H. per unit mass (other things being equal).

(d) It is well known that when the rays of the sun or of a fire full on a body, they warm it, but it must not be supposed that H. has travelled across the intervening space from the sun or the fire to the body warmed. It is known that the energy of radiation is not the same thing as H., though it is converted into H. when the rays strike an absorbing substance.

the rays strike an absorbing substance.

The question at once presents itself,
'What is heat?' In this connection it
will be well to follow briefly the development of the modern theory of H. It has
long been known that H. can be developed
by friction (e.g. between the wheels and
axles of a carriage), or by percussion (e.g.
by hammering a piece of Iron on an anvil),
or by compression (as in the case of a
bicycle pump). This development of H.
was accounted for by supposing that every

body in a normal state possessed a certain capacity for H. and contained a certain quantity of caloric at a definite temp. Percussion altered the condition of the substance and lessened its capacity for H. Some of the caloric was squeezed out of it, Some of the caloric was squeezed out of it, and, being thus set free, manifested its presence by the rise of temp. The weakness of this theory was shown by an experimental investigation carried out by Count Rumford in 1798. He mounted a gun-metal cylinder so that it could be rotated by h.p., while a blunt steel boring tool pressed against its bottom. The cylinder was covered with a layer of fannel to prevent loss of H., and its temp, was recorded by means of a thermometer placed in a hole drilled in the bottom. At the end of half an hour, when the cylinder placed in a hole drilled in the bottom. At the end of haif an hour, when the cylinder had made 960 revolutions, the temp. had risen by 70° F. He found that the metallic dust rubbed off by the friction from the cylinder weighed only 837 grains troy (less than "he of the weight of the cylinder). 'Is it possible,' he said, 'that the very considerable quantity of H. produced in this experiment could have been furnished by so inconsiderable a quantity of metallic dust, and this merely in conof metallic dust, and this merely in con-sequence of a change in its capacity for heat !

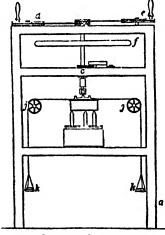

FIG. 1. JOULE'S APPARATUS

But Rumford went further, and showed that the capacity for H. of the dust was the same as that of the solid metal. The H. had clearly been produced by the fuc-tion, and was equivalent to the work done in rotating the cylinder under the con-ditions of the experiment. The accurate investigation of the relation between the work done in driving an apparatus and the H. developed was taken up by Ir. H. is generated. The supposition had Joule of Manchester in the year 1840. The been that the motion in such cases is not H. was produced by friction of a brass

paddle revolving in water contained in a specially constructed brass vessel, so that the water was heated by a kind of revolving churn process and the temp. was registered by a delicate mercurial thermometer. The paddles and the flywheel / (Figs. 1 and 2) were driven by two wheels d and e. If everything were free the friction between the brass vessel and the water would carry the vessel round with the paddles and the water could not be churned, and therefore it would not be heated. The vessel was prevented from rotating by two forces applied by two strings fastened in a groove round the vessel and passing over the pulleys and and weighted at k and k. From the number of revolutions made by the paddles, the work done was calculated.

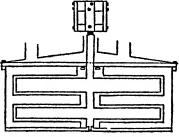

FIG. 2. BRASS VESSEL SHOWING PADDLES

After all corrections were made, Joule After all corrections were made, Joule decided that the work done in ruising a weight of 1 lb. through 772 ft. (at Manchester) will, if spent in friction (between brass and water), raise the temp. of 1 lb of water 1° F. Joule showed quite clearly that the amount of H. produced depended on the amount of work done and on nothing else. He found the same result for friction of water in a brass vessel with a brass paddle, for friction of mercury contained in an iron vessel with an iron paddle, and for friction of two iron rings paddle, and for friction of two iron ring-rubbing against each other in mercury. Joule also proved that H. is absorbed when a gas does work in expansion; and measured directly the amount of H. liborated by the compression of a gas. The principle which these experiments have estab. Is that 'when H. is transformed into any other kind of energy, or rice versa, the quantity of H. which disappears is equivalent to the quantity of the other kind of energy produced, and rice versa.' But we have not given a satisfactory explanation of H. by saying that H. can be transformed into other forms of energy and rice versa. The idea that H. is ultimately due to a

The idea that H. is ultimately due to a motion of some sort has long been entertained. By friction and collision the sensible motion of bodies disappears and H. is generated. The supposition has been that the motion in such cases is not

the bedy as a whole to its individual particles. Thus, when a moving body is brought to rest by friction or collision, the energy of the original visible motion of the body is not annihilated, but passes over into the invisible molecules of the substances taking part in the friction or collision. This theory supposes that when a body is heated the rise in temp, is due to the increased energy of motion of the molecules of the body. But it goes further, and explains the transmission of radiant energy from one body to another, as from the sun to an individual on the earth. There is evidence in favour of the supposition that light is due to ways supposition that light is due to wave motion in the ether, and we have exactly the same evidence in favour of the same supposition with regard to radiant energy. Hadiant energy (for example the radiant energy emitted by hot-water pipes or a blackened stove) and light beliave in exactly the same way in a variety of experiments—in tact the only difference which can be detected is that light, as well as possessing all the characteristic qualities of the radiant energy is also able to as possessing an the characteristic quanties of the radiant energy, is also able to affect the sense of sight. Radiant energy then, like light, is supposed to be due to wave motion in the ether. We say that the molecules of a hot body are in a state the molecules of a hot body are in a state of very rapid vibration, or are the centres of rapid periodic disturbances of some sort, that they thus excite waves in the ether, that these waves travel through the other between a receiving body and the hot body with the velocity of light, and that when they fall upon the receiving hody they are more or less absorbed by hody they are more or less absorbed by the molecules of the receiving body, causing similar motions in these mole-cules. The sense of H. is thus excited in a human being, or an animal, by the waves of radiant energy which start from a hot body just as the sense of eight is excited body just as the sense of sight is excited by the waves of light which start from a luminous body. The fact that light waves possess heating properties if they are absorbed by a suitable substance suggests at once that there is no essential difference between waves of light and waves of radiant energy. Extensive spectroscopic experiments have shown that the two cets of waves differ only in degree and not in of waves unter only in degree and not in kind. The ordinary spectroscope cannot be used, as glass absorbs the waves of radiant energy. Lenses and prisms made of rock salt are used in the instrument, and the radiations are received on the blockward bulber of the received and blackened bulb of a thermometer, or on the blackened part of an electrical instrument for recording temp. In this way the similarity between waves of radiant energy and waves of light has been estab.

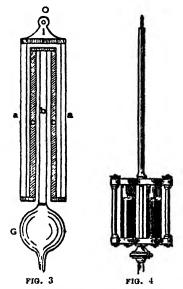

CALORIMETRY.—The scientific unit of H. is the calorie, which is defined as the H. is the calerie, which is defined as the quantity of H. required to raise the temp. of I gm. of water I' C. Other units of H. are the Brit. Thermal Unit, which is defined as the amount of H. required to raise the temp. of I lh. of water I' F., and the Therm, which is equal to 100,000 B.Th.U. In order to measure a quantity of H., the simplest way is to measure the rise of temp. produced in a known mass of materia contained in a witchle wassel or

calorimeter. Calorimetry is fully in text-books on H. These discussed

EFFECTS OF HEAT.—These may be summarised briefly as follows: (1) change of dimensions or of vol.; (2) change of internal stress; (3) change of state; (4) change of temp.; (5) electrical and chemical effects. Each of these will be considered in trees. considered in turn:

considered in turn:

(1) ('hange of dimensions.—Most bodies expand or increase in vol. on being heated. In laying down the rails of a railway, an interval is left between consecutive rails to allow for this. The expansion due to rise of temp. must be taken into account in building steel bridges and in setting up pipes which are to carry hot water. The

COMPENSATING PENDULUM

pendulums of clocks and the balance wheels of watches have to be compen-sated, so that the time of swing shall not be altered by changes of temp. In Fig. 3 a compensated pendulum is shown; the bob G is supported by the rods, a, a, b of one material and the rods, c, c of another material. The lengths of the rods are so adjusted that, whatever the temp., the centre of gravity of the pendulum is always at the same distance below the point of support O.

In Fig. 4 the downward expansion of the rod is compensated by the upward expansion of the mercury. In Fig. 5 the rim of the whoel is made up of three seg-B.Th.U. In order to measure a quantity ments, each of which consists of two of H., the simplest way is to measure the metals securely fastened together, the rise of temp. produced in a known mass more expansible being on the outside. of water contained in a suitable vessel or When the temp. rises, the spoker increase in length, but this is compensated by the bending inwards of each of the segments of the rim. An alloy known as invar, which consists of 64 per cent of steel and 36 per cent of nickel, has an extremely small coefficient of expansion, and it is often used in pendulum clocks, since no compensating device is required when the rod and bob are made of it.

The coefficient of expansion of liquids

The coefficient of expansion of liquids is, as a rule, much greater than that of solids, while the coefficient of expansion of gases at constant pressure is very much greater than that of solids or liquids; greater than that of solids or liquids; further, it is independent of the nature of the gas, i.e. oxygen expands to the same extent as an equal vol. of hydrogen, air, or any other gas for a given rise of temp. under the same conditions of pressure.

(2) Change of internal stress.—Many of these changes in vol. are accompanied by changes in the internal forces or stresses between the molecules of the body. As

between the molecules of the body. As a wheel tyre contracts it is subject to enormous internal stresses. If air or any

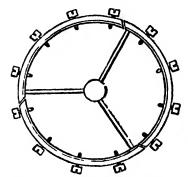

FIG. 5. BALANCE WHEEL OF WATCH

other gas is confined in a closed vessel and its temp. is raised, the pressure exerted by the gas is increased and may burst the vessel. The tyres of a motor-car are often caused to burst in this way in

(3) Change of state.—There are three (3) Change of state.—There are three states of matter, viz. solid, liquid and gaseous states, and, as Black discovered in 1756, the change from one state to another is accompanied by the evolution or absorption of H. Because a thermometer shows no change of temp. while a change of state is taking place, Black referred to this H. as Latent Heat. For example, 30 calories of H. are required to change i gm. of ice into 1 gm. of water at 0°C.

(4) Change of temperature.—If a quantity of water be heated, we can tell by our sense of H. that it is becoming hotter; and in scientific language we say that its temp, is rising. The change of temp, can be measured by means of a thermometer (q.v.).

(5) Chemical and electrical effects, Chem. changes commonly accompany the Chem. changes commonly accompany use heating of a body. Thus when coal is heated in air, it combines with the oxygen of the air and burns; this process, once started, produces sufficient H. for its continuance. The electrical effects of H. once started, produces sufficient H. for its continuance. The electrical effects of H. are of two kinds: (a) That produced when a circuit is made up of wires of different materials, say copper and iron joined together at each end, and the temp. of the two junctions is different; then a small electric current flows round the circuit. This effect is known as the thermo-electric effect (see Electricity). The thermo-electric flows round the circuit. This effect is known as the thermo-electric effect (see Electricity). Thermo-electric tip, and was discovered by Scebeck in 1821. Since a very small electric current can be measured easily, this effect of H. is used in many temp. measuring instruments. (b) The change produced in the electrical resistance of bodies by H. This has been made the basis of a mothod of measuring high temps, by means of the platinum-resistance thermometer (q.r.).

Modes of transference of Heat.—There are three modes of transference of H.:
(i) Convection, (2) Conduction, and (3) Radiation. (1) In convection H. is carried or conveyed by the motion of heated masses of matter. The most familiar instances of this method of transference of H. are the heating of buildings by the circulation of hot water (see Heat-

familiar instances of this method of trans-ference of H. are the heating of buildings by the circulation of hot water (see Hear-ing and Ventillation), or the equalisa-tion of temp. that is produced by the movement of the hot water in a mass of water heated from below (as in the case of a kettle). Convection can only take place in fluids, and the process con-stituting convection takes place as follows. The fluid is heated and expands so that it becomes less dense than the colder sur-The fluid is heated and expands so that it becomes less dense than the colder surrounding fluid. It is therefore pushed upward by the denser fluid, and it takes its H. with it. Convection plays an alimportant part in ventilation.

(2) In conduction, H. is transferred without visible relative motion of the parts of the body. Familiar examples of this are the transference of H. from one end of a poker ularyd in a fire to the other

end of a poker placed in a fire to the other end, and the transference of H. from one end of a silver spoon, placed in hot tea or coffee, to the other and. Conduction always takes place from the hotter to the colder parts of a conductor. All metals are good conductors of heat, while most non-metallic substances, liquids (excluding mercury) and gases are poor conductors of H.

(3) Radiant H. has been shown to consist of light of longer wave-lengths than those that affect our sense of vision. There is no other essential distinction between 'ordinary' light and radiant H. Both travel with the same velocity of 186,000 m. per sec. in vacuu, and we receive all our H. from the sun by means of radiation that travels across empty space incapable of conducting or conveying H. to us by the other modes referred to above.

In must cases H. is transferred by all three methods simultaneously. It is interesting to notice that the thermos (3) Radiant H. has been shown to con-

flack (q.v.) designed by Dewar attempts life, however, man requires some form of to prevent the transference of H. to or H. apparatus in addition to clothes and from the enclosed liquid. It consists of a houses. In devising such apparatus the double-walled vessel of glass (a bad conductor of H.), whose inner faces are considerations of economy and efficiency, space between the walls is evacuated to provide the deviation and atmospheric humidity. prevent transference of H. by conduction or convection.

or convection.

The chief sources of H. are: (1) the sun; (2) chem. action, as in the burning of coal, wood, oto.; (3) mechanical act, e.g. friction; (4) electrical energy, e.g. heaters and lamps; (5) change of state, e.g. from solid to liquid. It is interesting to note that the ultimate source of all H.

to note that the ultimate source of all H. in the above cases is the sun.

Heathfield, George Augustus Eliott, Baron (1717-90), Brit. gen., a younger son of Sir Gilbert Ellott, b. at Stobbs, Roxburghshire. After having been educated at Leyden Univ. and at Woolwich, he fought with the Prussian army in 1735-36, and as a greendier guard in the he fought with the Prussian army in 1735-36, and as a grenadier guard in the war of Austrian Succession at Dettingen and Fontenoy. In 1776, at the outbreak of the Amer. War, he was sent out as governor to Gibraltar. His heroic defence of that fortress against Spain, from June 1779 to Feb. 1783, is one of the finest schievements in Brit. hist. On his return to England in 1787 he was created Baron H. of Gibraltar.

Heating. The temp, of a human being in good health is 98.4° F. When the external temp. rises, that of the body is regulated by perspiration while a low external temp. may be counteracted by increased bodily exercise. In civilised

For detailed arrangements concerning ventilation the article on that subject must be consulted.

In the first place, consideration must be made of the fact that heat is lost from a building by conduction through the walls and especially through windows, and by the leakage of warm air and the consequent entrance of cold air for pur-poses of ventilation. It is the architect's business to make a study of the losses of heat in this way when designing large buildings before computing the necessary

supply of heat.

All systems of H. depend either upon convection or radiation (see HEAT) or upon a combination of both. The most common and obvious method of H. is, of common and obvious method of H. is, of course, by radiation, and is exemplified by the open fire. By this means the walls and furniture and occupants of a room are heated and the air left cool. Heat is radiated not only from the fire itself but from the back of the grate and from the sides. The effective radiating surface of an open fire is increased by making the sides. The effective radiating surface of an open fire is increased by making the sides of a grate inclined at an angle of at least 120° to the back, and the back is made to hang forward over the fire. Further the grate should be bounded on both sides by firebrick and the overhanging part should be made of the same material. The advantages of this method of H and (1) good wantilation has a second and the same of the same o material. The advantages of this discussion of H. arc (1.) good ventilation, because of the draught up the chimney. (ii.) air in the room is left cool, (iii.) psychological effect of the open fire. The latter is a big the cool of H. effect of the open fire. The latter is a big inducement to retain this method of H. in spite of the fact that nearly 80 per cent of the heat from the coal is lost to the

The latter consideration was responsible for the gen. adoption of stoves in colder countries. While the stove is much more efficient than the fire-grate it much more efficient than the fire-grate it is apt to give off noxious times into the room and to produce a 'dry heat' that is unhealthy as it affects the throat and the chest. Bad odours are also prevalent with stoves owing to the burning of the durt in the air as it comes in contact with the hot metal. Gas stoves, which usually consist of asbestos, or some similar substance heated by a row of Russen burners. stance, heated by a row of Bunsen burners (q.r.), are popular where fires are only used occasionally. They act, of course as open fires, but should always be fitted to an efficient flue to carry off the products

the system which allows for the expansion transmission has to be added. If the of the water and by means of which the electrical energy is generated by water placed by the power, however, it is sufficiently economical to make its conveniences attractive. water returns via a vertical pipe to the boiler where it is heated again. Air cocks are placed at the tops of the radiators to that any accumulated air which

impedes circulation may escape.

There is also a single-pipe system of central II. in which the hot water is taken from a single main pipe to each radiator and the return is made to a point farther along the pipe. In this system radiators for removed from the main pipe are supplied with cooler water than those nearer to it and for this reason distant radiators are made larger. The temp. of the water leaving the boiler in most systems is about 180° F. In large buildings the circulation of the water by convection is too sluggish and is further opposed by friction between the water and the pipes. In this event a pump is installed to force the water round the system. Ventilation must be attended to very

ventilistion must be attended to very carefully wherever central H. is adopted, for the radiators heat the air in the room and the heat is thus distributed by convection currents of air as well as by radiation (to a small extent). The air is radiation (to a small extent). The air is not naturally renewed, however, and in large buildings systems of ventilation are often installed. In small rooms the disadvantage cur be remedied by placing the radiators be neath open windows. The hot air rising from the radiator then carries along with it a supply of fresh air as it rushes past the window and construction. as it rushes past the window and conveniently warms up the cold air before it is distributed in the room. The hot-water system is not suitable for tail buildings and a steam-II. system is necessary in such cases. The most widely used (especially in America) system of the latter class is the Vacuum system. Steam is generated in a boiler and passes thence by means of a steam supply pipe to radiators installed in the various rooms. The steam passes in at the top of the radiator via an inlet valve and condensing in the radiator it gives up its latent heat to it. Air and condensed steam pass through a thermostatic trap (designed to prevent the passage of steam) into a return pipe. where it is drawn back to the boiler by means of a so-called vacuum pump. this way rapid circulation is maintained Central H. systems have naturally been developed extensively in America and the steam heating systems there are frequently arranged with one central boiler supplying a whole dist. In Iceland

geyser water is piped to Reykjavik.

Electrical Heating.—The disadvantage of this form of heating is its cost. The ultimate source of the electrical energy 13 ultimate source of the electrical energy is the combustion of coal in steam engines. The efficiency of such engines (i.e. percentage ratio of energy developed to energy supplied) is itself low, and additional loss takes place in the conversion of the mechanical energy of the engine into electrical energy in the dynamo. Still further energy is lost in the cables, in the form of heat, in transmitting the electrical energy and of correction control of the control of the correction of the correcti

At present there are no immediate prospects of such cheap generation of electrical energy being generally adopted in Britain, though the proposed Severn dam would provide a large supply of hydro-electric

power (q.v.).

For H. by hot air, see VENTILATION, since this concerns the heating of air before it is brought into a room. See also under Boilers, Electric Lighting, Furnaces, Fuels, and Gas Water Heat-ers. See H. G. Solomon, Domestic Elec-RRS. See H. G. Solomon, Domestic Elec-tric Healing, 1927; A. A. Jones (ed.) Modern Heating and Ventilation, 1935; E. C. Stanford, Central Heating and Hot Water Supply for Private Houses, 1938; L. J. Overton, Domestic Hot Water Supplies and Central Heating by Hot Water, 1939 and Central Heating, 1949. Heat of Formation. Whenever a chem.

reaction takes place, heat is either evolved (exothermic reaction) or absorbed (endo-thermic reaction) in the process. In the thermic reaction) in the process. In the case of combustion, the quantity of heat evolved is large, in other cases smaller, and in some negative. The H. of F. of a compound is the amount of heat, measured in calories, which is evolved when the molecular weight in grams of the compound is formed from its elements. Thus, when 2 grams of hydrogen combine with 6 grams of oxygen to form 18 grams of when 2 grams of hydrogen combine with 16 grams of oxygen to form 18 grams of water, 69,000 calories are evolved, which amount is said to be the H. of F. of water. The quantity is determined by carrying out the reartion in a calorimeter surrounded by water, the product of the mass of water and its rise if temp. giving the quantity of heat liberated. In cases quantity of heat liberated. In cases where the H. of F. cannot be determined directly use is made of the fact, summed up in the law of Hess, that the quantity of heat evolved or absorbed in the formation of a compound is quite independent of its mode of formation. Thus the H. of F. of carbon monoxide may be arrived at from the following considerations: (1) On forming a gram molecular weight of carbon dioxide from carbon monoxide and oxygen, 67,000 calories are evolved. oxygon, 67,000 calories are evolved.

(2) On forming the same weight of carbon dioxide from its elements, 96,960 calories are evolved. Therefore, on forming one gram molecular weight of carbon monoxide from its elements, 96,960 minus 67,000, or 29,960 calories are evolved. This may be represented as follows:

Certain compounds, such as acetylene A. hydrogen iodide, and nitric oxide are 'endothermic,' i.e. have heat 'stored up' in them, which is liberated on their decomposition into their respective elements.

Heat of neutralization is the heat change taking place when gram equivalents of acids and bases neutralize one another in the form of heat, in transmitting the acids and bases neutralize one another in electrical energy, and of course the cost of very dilute solutions. Heat of solution is

Heat clouds, and sometimes the superior region clouds, and sometimes the superior region of the stars. In the medieval scholastic philosophy (vide Summa Theologiae of St. Thomas Aquinas) these two are grouped together as the 'firmament,' but it has been suggested that the Jews spoke of them as the first and second Hs., while the abode of God and the Saints, that is to say, H. in the theological sense, was spoken of as the third H. With this is connected St. Paul's reference to the 'third H.' in 2 Cor. xii. 2. Other classifications of the Hs. are found in Jewish and cations of the Hs. are found in Jewish and Lat. theology, the most important being that of the Cabbala, representing the later Rabbinic conceptions. Here we find a sevenfold subdivision of the heavenly regions, of which the highest is the abode regions, or which the highest is the abode of God, the lowest, the region of the stars. This classification has passed into the Mohammedan theology, together with much of the Rabhinic angelology. As the abode of God, H. must be considered as some region of space in which God makes a special manifestation of Himself, and this concention is found running. and this conception is found running through the whole of the Biblical narra-tives and Patristic writings. Lastly, H. is often spoken of as a state, the condition of those souls who share the life of Christ. Thus, in Ephes. ii, 6 and in Phil. ii. 20
this conception, that even now the life and
sonversation of Christians are 'in H.' and
in heavenly places,' is clearly present.

HORRE (DISEASES).

Heaviside, Oliver (1850-1925). Eng. scientist who carried out much important work on practical electrical research and work on practical electrical research and on the more theoretical aspects of the subject; b. in London. For a few years, ending 1874, he was employed by the Great Northern Telegraph Co. but he retired because of deafness. Afterwards lived in Devonshire, studying electro-magnetic radiation in its application to telegraphy and telephony. He made fundamental discoveries on telephonic fundamental discoveries on telephonic transmission, but is most commonly remembered for his suggestion that an upper layer of the air (the 'Heaviside layer') has conducting powers that serve to confine wireless and other electromagnetic waves to the neighbourhood of the surface of the earth. F.R.S., 1891. Pub. Electro-Magnetic Theory (1893–1922).

- Heavitree, E. suburb of Exeter, Devonshire, England, included in the Exeter

the heat change taking place when the gram molecular weight of a substance is dissolved in a very large quantity of water, usually represented as Aq.

Heaton Norris, tn. of Lancashire, England, situated on the Mersoy, 4 m. S.E. of Manchester, and forming a suburb of Stockport; it is connected with the latter by a bridge and viaduct. It is a busy industrial tn., with cotton and thread mills. The Ashton, Manchester, and Oldham Canal ends here. Pop. 12,000.

Heat-variation, see Barytes.

Heavy water, water in which the heavy isotope of hydrogen with an atomic weight of 2. Formula D₂O. It is considered in ordinary water to the extent of about 1 part in 5000 and may be obtained by the fractional electrolysis of water, D₂O being electrolysed more slowly than regard of a full transport of the extent of about 1 part in 5000 and may be obtained by the fractional electrolysis of water, D.O being electrolysed more slowly than H₁O. In atomic science D₁O is used to slow down fast-moving neutrons.

Hebbel, Christian Friedrich (1813-63). Ger. poet and dramatist, b. in humble circumstances at Wesselburon in Dithmarschen, Schleswig-Holstein. After travelling on the Continent, he settled in Vienna (1846), where he d. His first tragedy, Judith, was performed at Hamburg in 1841, and made his reputation. His tragedies are very powerful, and show a fine sense of dramatic situation; but they depict for the most part the passionate struggles of hot and ugly natures, and his struggles of hot and ugly natures, and his scenes are unrelieved by humour or by lovoliness. His chief works are: Maria Magdalena (1844), Julia (1851), Gyges und sein Ring (1856), and Die Nibelungen (1862). His lyric poems are included in Gedichte (1841-48), and Mutter und Kind (1851). R. M. Werner's critical ed. of his works, 1901-03, and studies by E. A. Georgy, 1904, 1922: P. Bornstein, 1924; and K. Ziegler, 1938.

Hebburn, tn. of Durham, England, situated on the S. bank of the Tyne, in the Jarrow div., 4 m. N.E. of Gateshead. There are chem. and engineering works, coal nitnes, and lead smelting works. Shipbuilding is also carried on. Pop. 24,000.

24,000.

Hebden Bridge, tn. of the W. Riding of Yorkshire, England, on the R. Calder, in the Sowerby pari. div., 8 m. W. by N. of Halifax by rail. The tn. has cotton factories, dye-works, and foundries. Pop. 7000.

Hebdomadal Council, The, governing body of the univ. of Oxford. It was evolved, in 1854, out of the Hebdomadal Board, instituted in 1831 by Charles I., probably at the suggestion of Archishop It consists of the chancellor, vicechancellor, late vice-chancellor, two proctors, er officio, and six heads of houses, six profs, and six members of convocation,

six profis, and six members of convocation, elected by congregation. The council holds its meetings weekly during term.
Hebe, Gk. divinity, goddress of youth, daughter of Zeus and Hera, and cupbearer of the gods before the coming of Canymede. She was the wife of the defied Heracles, with whom she was worshipped at Athens. In Rome she was worshipped as Juventas in a temple on the Capitoline [HI]

as Juventas in a temple on the capitoline Hill. She had the power of restoring the aged to youth. The most famous statue of H. is the masterplece of Canova. Hebel, Johann Peter (1760–1826), Ger. poet, b. at Basie. He studied theology at Erlangen (1778–80), subsequently teaching at the Gymnasium at Karlsruhe. He wrote his neams in 'Alsmanic' dialect: wrote his poems in 'Alemanic' dialect:

his Allemannische Gedichte was trans. by Reinick into High Ger. in 1891. His work was fresh, hunorous, and full of vigour. and attained great popularity. The Schatzkitslein des rheinischem Haustreundes (1811), contains first-rate stories. The first complete ed. of his works was pub. in 1832-34 and further eds. by W. Zentner (1929) and W. Altwegg (1942). See lives by Schullheiss, 1831; C. Längin, 1894; N. Attwegg, 1935; and S. Löffler, 1944. Heber, Reginald (1733-1826), Eng. bishop, b. at Malpas, Cheshire. After graduating at Brasenose College, Oxford, and touring in Europe, entered holy orders (1807), and accepted a living at Hodnet, Shropshire. He was appointed Bampton lecturer, 1815; preacher of Lincoln's Inn., 1822; and bishop of Calcutta, 1823. He is chiefly remembered by the hymns he wrote, the best known being 'From Greenland's Icy Mountains,' 'The Son of the dear the first half of the first millennium B.C. The words town as Greenland's Icy Mountains,' 'The Son of the dear the standard of Gezor, with a summary list of graning operations arranged by the control of the first millennium arranged by the control of the first millennium arranged by the control of the first millennium arranged by the first first for the first millennium arranged by the calculation arranged by the calculation arranged by the calculation arranged by the first millennium arranged by t

and touring in Europe, entered holy orders (1807), and accepted a living at Hodnet, Shropshire. He was appointed Hampton lecturer, 1815; preacher of Liucoln's Inn, 1822; and bishop of Calcutta, 1823. He is chiefly remembered by the hymns he wrote, the best known being 'From Greenland's Icy Mountains,' 'The Son of God goes forth to War,' and 'Hrightest and best of the Sons of the Morning,' Besides his Hymns (new ed. 1878), his pubs. include: A Journey through India (1828), and Palestine: a Poem (1809). See lives by his widow, 1838, and G. Smith. 1895.

Smith, 1895.

Hébert, Jacques René (1757-94), Fr. revolutionist called 'Père Duchesne,' b. at Alencon, and went to Paris as a servant. At the outlignk of the Revolution he became an extreme Jacobin, propagating his views in Le Père Duchesne (which he ed., 1790-91), and in various pamphlets, such as La Lanterne marque (1790). Ho joined the Club of the Cardeliers (1791), became a member of the Commune (1792). He took part in the Sopt, massacres and sat on the commission which judged Marle Antoinette. He inangurated a 'Worship of Reason,' the followers of which were called Hébertists or Euragés, but was arrested by his rival Robespierre, and guillotined on March 21, See studies by C, Brunet, 1857; and Mater, 1888; and F. V. Aulard, Le Culte de la raison, 1892.

F. V. Aulard, Le Culte de la raison, 1892.
Hebrew Language, Writing and Literature. Language, in which almost the whole of the O.T. (see BIBLE) was written, is a branch of the great Semitic family, so called (since 1781) from the name of Shem, the first-born of the three sons of Noah (Gen. x.). The Hebs. or Israelitos and the Aramaeans are considered as belowing to the so-called sons of Notal (1998. X.). The Hobs. or Israelites and the Aramaeans are considered as belonging to the so-called 'Third Semitte immigration,' which during the second millennium E.C. occupied Palestine, Syria and N. Mesopotamia. The Semitte languages lend themsolves to the following div.: (1) The N.W. group, consisting of two main branches, Canaanite (including Heb., Phenician, Moabite) and Aramaic (including Syriae); (2) the E. group (including Accadian, Assyrian and Babylonian); and (3) the S. group (Including Arabic and Ethiopic. All these languages possess certain features in common, obscured, however, to some extent by the particular developments of each. The chief of these Semitte peculiarities are: (1) Stems mainly based on three consonants; therefore (2) the scripts generally consisted of consonants only, the cuneiform writing (q.v.) forming ilarities are: (1) Stems mainly based on three consonants; therefore (2) the least eight centuries, from about 1000 scripts generally consisted of consonants s.c. to the second century s.c., but its only, the cunciform writing (q.v.) forming most flourishing period lasted from the

half of the first millennium B.C. The earliest is a small stone-tablet, known as the Calendar of Gezer, with a summary list of farming operations arranged by months. It can be assigned to c. 1000 B.C. The important Moabite stele of King Mesha', belonging to the middle of the ninth century B.C., is written in a dialect almost identical with Heb. About 80 ostraca, or inscribed potsherds, found at Samaria, belong to the ninth or eighth century B.C. They are invoices of oil and wine, and are written in a beautiful cursive type, and provide us with examples of the dialect and cursive script of the N. Kingdom of Israel. The most important epigraphic monument from Judaea is the siloam inscription, assigned to c. 700 B.C. The Early Heb. cursive writing reaches its peak in the now famous collection of twenty-one letters and other documents from Lachish (in S. Palestine), written in ink in a bold script in perfect Biblical Heb. A considerable number, about a 150, of inscribed stone seals have also been discovered in Palestine, and they attent the of inscribed stone seals have also been dis-covered in Palestine, and they attest the diffusion of writing among the Hebs. in the pre-exilic period (first half of the first mil-iennium B.C.). Stamps impressed on jar-handles, inscribed weights and measures, marks on pottery and masonry, and other miscellaneous documents, all have a certain value from the palacographical as well from the linguistic and historical point of view. All these inscriptions are written in the Early Heb. alphabet, which, together with the Phonician, belongs to the Canawith the Phenician, belongs to the Canaanite branch of alphabets (see Alphabet). Both the writing on Jewish coins from the Maccabean age to Bar Kochba's revolt (140 B.C. to A.D. 132-13.), and the beautful, neat, and symmetrical Samaritan alphabet, still in use for liturgical purposes, are direct derivatives of the Early Heb. script. On the other hand, the modern Heb. alphabet (see Fig. on p. 266 of Vol. I.), in all its monumental, book-hand, and cursive forms, is not a descendant of the Early Heb. alphabet, but of the 'Square-Hebrew' alphabet, which was a derivative of the Aramaic alphabet and can be traced from the second and first centuries B.C.

eighth to the sixth centuries B.C. After the return from the Exile, Heb. was gradually supplanted by Aramaic, but it is erroneous to think, as some scholars do, that it died out. Actually, it continued to be employed in 'national' circles. However, considerable portions of the biblical books of Daniel and Ezra are written in Aramaic. We see even from tending over a period of some six or seven tending over a p can see from the later books of the U.T.—
it is largely intermixed with Aramaic
forms and coloured by Aramaic idioms.
Heb. continued to be the language of
religious literature and poetry, and
scholars made continuous efforts to keep
up its high standard. A new form of
Heb. was developed. It is known as
Mishnaic Heb. It was partly artificial,
containing a certain number of borrowings
from the Aramaic Cit and containing a certain number of borrowings from the Aramaic, Gk., and Lat. languages, and, at a later stage, from Persian and Arabic, and was so called because the chief literary monument of this period (second to third centuries A.D.) is the Mishnah (from Heb. shanah, 'to learn by heart, to repeat'), which is a kind of code, containing nearly four thousand rules. To this code, later on, was added the Gemarah (from gamar, 'to supplement,' to complete 'or also' to learn'), which is a sort of complement of and commentary a sort of complement of and commentary on the Mishnah, and includes the store of Hagadah ('homily'). The Gemarah is written in Aramaic: Mishnah and Gemarah together form the Talmud (i.e. what is 'learnt', or 'taught,' from Heb. lamad, 'to learn'). There are two Talmuds in existence, the Babylonian Talmud (written in Aramaic) and the Jerusalem Talmud (written in Palestinian Aramaic). While both have the same Mishnah, they differ considerably in their Gomarah. The Babylonian one is the more perfect and authoritative, and it is also much more copious (about four times as large) than the Jerusalem Gemarah. The Talmudic literature was intended principally for the learned. It grew from the discussions in the academies and schools; and thus a sort of complement of and commentary learned. It grew from the discussions in the academies and schools; and thus there arose also a system of biblical expositions, and popular lectures and sermons. These discourses were given in the synagogues, and formed the basis of the Midrashic literature, the Midrash, from Heb. darash, 'to expound.' (Quotations from prior Midrashie works, especially those whose contents are Halachic ('legal') are in Heb.) The word Midrash also meant 'doctrine' or 'study,' and was sometimes used synonymously with Talmud or Gemarah. The Talmudic literature is a very valuable body of laws and decisions, a monument of Jewish learning, acumen and wisdom, and it learning, acumen and wisdom, and it has moulded the Jewish people, promoting their intellectual activity, regulating their conduct, influencing their

mathematics, law, medicine, anatomy, etc.—we are bound to come across much etc.—we are bound to come across much that is useless. However, its main idea heing 'to make a fence round the law,' it succeeded in preserving Judalem for many centuries to come. The study of the Talmud spread rapidly through all countries of the diaspora, from Habylonia through N. Africa and Italy to Spain, France and Germany.

Another important branch of Helb. Ilterature is the Pryputim, or 'liturgical poems.' Some of these survived in the Jewish prayer-books, but a great part seems to have been lost for ever. Many fragments of Plyyut literature were discovered in the famous Genizah of Cairo This enormous collection derives its name from the Heb. ganaz, to hide, store up.
The Jews were accustomed to put away
all sorts of material written or printed in
Hob. lest anything on which the name of God might be inscribed should be descrated by profane use. Some of these fragments have already been pub. in I. frugments have already been pub. in I. Davidson's Theorem. of Medician Hebrew Poetry, 1821-29, others have still to be studied, and recently a Research In stitute for Hebrew Poetry has been founded at the Heb. Univ. of Jerusalem. with the task of reconstructing this lost branch of Heb. literature. The authors of those poems belong to different periods and localities. Of some nothing but their and localities. Of some flowing out their names are known. Others are more or less known; the earliest of them seem to have lived in the sixth to eighth centuries a.D., but the majority belong to the ninth to eleventh centuries. Those beautiful poems written mainly in Heb., reflect many of the salidous and cultural life. aspects of the religious and cultural life of Oriental Jewry during the millennium following the destruction of the Temple. some of these poems were composed by the celebrated Gaon Saadya (b. 822). Other important literary work was pro-duced under the Gaonate (see GAON).

The Heb. alphabet, as already men-tioned, was purely consonantal, but the absonce of vowel-letter was not strongly felt, because, it must be emphasised, the Semitic stems are essentially consonantal. Semino steins are essentially consonantal. However, as Heb. speech passed out of daily mae, it became necessary to introduce some form of vocal distinction in order to read and explain the Holy Scriptures correctly. Originally, four of the

consonants (the glottal dleph and Mt, and the semi-vowels waw and yod) were also employed to represent long vowels, but gradually they began to lose their weak to increase the inneteenth century the language of consonantal value, and became a kind of vocal consonants, known as matres lectionis. Not only were they used as long vowels, but (for instance in the centry discovered Heb. MSS. which are partly assigned to the second century recently discovered Heb. MSS. which are larguage of the Jewish religious schools, and was also the lingua france of Jewish recently discovered Heb. MSS. which are destructions occurred at various times in destructions occurred at various places, but Heb. remained up to various places, but Heb. remained up to various places, but Heb. remained the induction of the synagogues, of the Jewish religious schools, and of the Jewish prayers, and of the Jewish religious schools of the synagogues, of the Jewish religious schools of the synagogues, of the Jewish religious schools of the synagogues, of the Jewish religious places, but heb. Also and the surious places, but heb. The destruct recently discovered her. his., which are partly assigned to the second century s.c.) they were used with such abundance and with so many combinations of two letters, such as ited-alieph, waw-dleph, etc. that the change in spelling or addition of letters became forbidden. The omission letters became forbidden. 'The omission or the addition of one letter might mean the destruction of the whole world 'says the Talmud. It became, therefore, necessary to introduce a complementary system (not to be employed in the synagogue rolls) of vocalisation by punctuation marks, called niquid. Three such vocalisation systems are known, the 'Babylonian,' which was superlinear, the 'Palestinian,' also superlinear, and Tiberiadic,' parly superlinear, but mainly sublinear. letters became forbidden. linear.

If Rabbinic Judaism was mainly creative, medieval Judaism was mainly preservative. Medieval Judaism too possessed creative minds, philosophers, codisessed creative minds, philosophers, codi-fiers, teachers, commentators, polenic writers, great poets, but their common starting-point was, generally speaking, the Talmud. In Cairo there was a galaxy of Jewish intellect, while in Spain Jewish culture was to reach a height it had never previously attained. Jehuda Halevi (1080-1140), a Hob. poet of the most fervid dopth of heart, 'poured forth his passionate longing for Palestine in words of matchless sublimity' (E. forth his passionate longing for Palestine in words of matchless sublimity (E. Levine), but the most important contribution to Judaism came from Moses Maimonides (1135–1205), the greatest intellect in Jewry in the Middle Ages. Ho is regarded as a "second Moses," Maimonides wrote in Heb. and Arabic. Also the writtens of the creat negligical Proposes. the writings of the great medieval Franco-Jewish Biblical commentators Solomon ben Isaac of Troyes, known as Rashl, and David Kimchi of Narbonne were of the highest importance. Rashi (1010–1103) wrote a commentary on the entire Talmud. and another on the Bible. Kimchi's commentary was used in a large degree by successive generations of Christian exe-getes, particularly in the preparation of the Eng. 'Authorised Version' of 1611. Other great commentators were Gershom Other great commencators were Germoni date tenth and early eleventh century), Abraham ibn Esra, Moses ibn Esra, Nachmanides, Jacob Tam, the founder of the school of Tossaphists who flourished in France and Germany for over two hundred years, Meier of Rothenburg, and Joseph Cars, who in the sixteenth contury composed the Shulchan Aruch, a collection of former Jewish codes, which remained of former Jewish codes, which remained the standard guide in Jewish life. Despite the various inquisitions and censorships of the Christian Church and

her attempts during the Middle Ages to eradicate Heb. literature altogether, the Heb. language survived. In Paris, in

bave combined to associate the return of the Jews to Palestine with the return to Heb. The ideal is the estab. of the Heb. Heb. The ideal is the estab. of the Heb. nation, speaking the Heb. tongue, on the soil of the anct. Hebs. The cultural renascence involved in the foundation of the Jewish State of Israel in Palestine is necessarily based on Heb., language of the national past of the Jewish people and of their great original contributions and of their great original contributions to civilization. But, also, a common language was a practical necessity for a polygical community of lawish impulgrants. polygiot community of Jewish immigrants into Palestine from all parts of Europe and the Near E., and no language excepting Heb. had any claim to gen. acceptance. While this rebirth of Heb. is the fundawhile this redirth of Heb. is the fundamental achievement of Zionism in the cultural sphere, Heb. had ceased to be exclusively a religious language, even in the wide connotation of the term 'religious' as applied to Judaism, a century before the birth of Zionism as an organised movement. From the latter half of the eighteenth century onwards, a secular Heb. literature had developed amongst the Heb. literature had developed amongst the Jews of E. and central Europe (its bp. being Italy), though it was a purely literary movement and its language not one in which people habitually spoke or thought. It was, in fact, only with the energence of the national idea in the eighties of last century and the estab. of Jewish settlements in Palestine that Heb. began once again to be a spoken language and the possibility created of a Heb. literature firmly rooted in the life of the people. To-day the supremacy of Heb. people. To-day the supremacy of Heb. in the life of the Jews in Palestine is assured. The pioneer work of the early lieb, teachers has borne fruit in a network that the property of the schools as the property of the schools as the property of the schools as the property of the property work of Heb. schools, elementary, secondary, and technical, with some 100,000 pupils, and the educational tructure is crowned by the Heb. Univ. on Mount Scopus in Jerusalem. Heb. as it is spoken and written in Palestine to-day is substantially the language of the Heb. Bible and the other anet, and medieval iliterature of the Jewish people, though naturally much adaptation and development has been necessary to fit it for its new function under the conditions of to-day; but since the early days of Jewish resettlement in Palestine, men of scholarship have sought to keep the development of the language on the right lines (Leon Simon). Heb., indeed, which had been handed down for centuries as the language of prayer and literature, was, however, not a dead tongue before the appearance of the Zionist movement. It June 1242, twenty-four cartloads of Heb. has always been the lingua franca of

Jewish scholars all over the world, the language of correspondence between Jews language of correspondence between Jews living in various countries. During the Dark and Middle Ages the Jewish communities in the Muslim realm cultivated equally Heb. and Arabic. Their great writers from Spain, Gabirol, Halevi, Ibn-Ezra and Maimonides, wrote their poems and their homilies in Heb., their science and philosophy in Arabic. Furthermore, the revival of the study of Heb. by Christians, which was learnt from Jews, was an integral part of the Reformation and Renaissance in W. Christendom. In the dark ages of Jewish hist. which followed that epoch, Hob. was the regular lowed that epoch, Hob. was the regular vehicle of the religious life of the Jewish masses in Poland, though Yiddish, the Ger. Jewish dialect, which they developed as a second tongue, was the language of the home and the one in which their Heb. religious instruction was explained. And when, at the end of the eighteenth century, the Jews in Germany and W. Europe had the opportunity again to enter into the Jewish cultural activity, Heb., the language of literature, not Yiddish, the language of literature, not Yiddish, the language of the Disspors, was the instrument of their Jowish national education. Hebrews, see ISRAEL, JEWS.

Hebrews, Epistle to the, known also as the Epistle of Paul the Apostle to the Hebrews, bears in the oldest MSS. no further heading than the words, 'To the Hebrews,' and even this probably formed no part of the original letter, but was deduced from a reading of the contents. It cannot be proved that the evisile hore deduced from a reading of the contents. It cannot be proved that the epi-tile bore the title 'To the Lacdiceans' or 'To the Alexandrians,' as has been suggested; and the best MSS. do not give the remark found in the end of the Eng. trans... 'Written from Italy by Timothy.' All other particulars with regard to the epistle are equally matter for conjecture, for these is no eight of any clear tradition. epistic are equally matter for conjecture, for there is no sign of any clear tradition with reference to authorship, date, or exact destination. It is norally certain, is 2812 sq. nn. Only 200,000 acs. are used however, that the authorship is not Paulino, and this view is supported by the continuous tradition of the city of Rome where the epistic first appears, Skephard of Hermas (second century). But this city furnishes us with no positive tradition. In Africa an anet. tradition, the conjunction of Pauli which appears in Tertullian's De Pudicitia, c. 20, ascribes the authorship to Barnabas, the companion of Paul, while the Alexandrian tradition seems continuously to have ascribed it to the Apostle of the Gentiles himself. Origen held that the epistic was the development by a disciple of some of Paul's oral instructions. It is impossible here to discuss in detail the objections to the Alexandrian for there is no sign of any clear tradition

theory, but they are quite overwhelming. Neither vocabulary nor style is Pauline, and the gen. character of the epistle shows and the gen. character of the epistic shows that the writer was intimately acquainted with the circumstances of the congregation to which he wrote. There is nothing in this argument to indicate that Hebs. predominate in this congregation, and it is now generally held that Hone was probably its destination. The date is before A. D. 9.3 but the cuestion of authorship is Dably its desimation. And as a state of A.D. 95, but the question of authorship is still unsolved. The names of Luke, Priscilla, Apollos, Clement, and Silas have all been suggested. The aim of the writer was to warn and encourage those Christians—the older view has always been that the epistle was addressed to Christ-ians of Jewish extraction—who, awing to the stress of the times, were inclined to fall away from their allegiance to Christ; and, with this object in view, he sets himself to prove the finality and the perfection of the Christian religion, and its superiority to Judaism. See commentaries by A. B. Davidson, 1882; B. Westcott, 1903; W. C. Wickham, 1910; F. D. Narborough, 1930; and T. H. Robinson, 1933.

Hebrews, Gospel according to the, the most interesting of the apocryphal gospels of the first centuries. Origen and St. Jerome quote it occasionally, and the latter also made Uk. and Lat. trans. of it, but these last have perished. All the quotations from it lead one to consider it quotations from it lead one to consider it as an expanded version of the First Gospel, though it is said to be somewhat smaller than the canonical book.

Hebrides, or Western Islands, are situated off the W. coast of Scotland, and are divided into the Outer H. and the Inner H.

The Outer H. comprises Long Is. (Lewiswith-Harris), N. Uist, Benbecula, S. Uist, Barra, the Shiants, St. Kilda, and the Flannan Is. They are composed almost Flannan Is. They are composed almost entirely of gneiss, and are therefore sometimes called Gneiss 1s. The Inner II. are separated from the Outer group by the Minch and Little Minch. They are a scattered group, including Skye, Elgg, Muck, Coll, Tyree, Liamore, Mull, Staffa, Iona, Kerrera, Colonsay, Oronsay, Jura, Islay, and the Slate Is. The two groups contain more than 500 is., of which about 100 are uninhabited. They are included politically among the cost of Ross, Invernoss, Argyll, and Bute, but have their own ness, Argyll, and Bute, but have their own Member of Parliament. The total area

worth nearly £1,000,000 to the H., but | Memories, 1923; A. A MacGregor, Behold the purchase-tax levied at 66‡ per cent | the Hebrides, 1925; I. F. Anderson, To senously damaged it. The mosque itself, as distinct from the area, was adapted by the Arabs from a Crusaders' church; in it or within the precincts are the cenotaphs of Abraham and Sarah, which occupy two cotagonal chapels, of Jacob and Leah, N. of the area of the Haram, of Joseph, which is in a separate enclosure, and of Isaac and Rebecca inside the church. Excavations carried out in 1926-23 at H. by Dr. A. E. Mader for the Görresgesellschaft estab. the identity of the site of the famous mrkt. The church are coal mines, iron and chem. works, etc. Hagla. see Hekla. of Hadrian; and at the same time were disclosed remains of the Herodian build-ings and the basilicas of Constantine and ings and the ossiness of Constantine and Modestus. The city, which was much improved during the mandatory regime, has a municipal council and a pop. of about 24,000. In Aug. 1929 it was the scene of the worst of the Jewish massacres by Arabs during the outrages of that month over the Wailing Wall (q.v., and see also l'ALESTINE).

Hebrus, see MARITZA. Hebrus, see Maritza.

Hecatesus of Miletus (c. 550-476 B.C.),
Gk, historian and traveller, who vainly
tried to dissuade his countrymen, the
tonians, from revolting against Persian
rule, and, after their defeat, was one of
the ambassadors to the Persian satrap,
Artaphernes. The only certain work of H. is the Genealogies, or Investigations (an account of Gk. traditions and my thology); Travels round the Earth is sometimes attributed to him. See fragments in K.O. Muller's Fragmenta historicorum Gracorum i. 1891.

Hecate, Gk. goddess, daughter of the Titan Perses and Asterie, retaining her mighty power under Zeus. She ruled in Heaven, Earth, and the Netherworld, being frequently identified with Selene (moon). Artemis, and Persephone, and sometimes represented with three bodies. As patroness of magic, she was mother of Circe and Medea. She also presided over birth and death. She was worshipped in the wilder parts of Greece, especially at cross-roads, where black victims were sacrificed to her.

Hecht, Ben (b. 1894), Amer. writer, b. at Heoht, Ben (b. 1894), Amer. writer, b. at New York City. Joined the staff of the Chicago Daily News, 1914, serving till 1923. Founder and publisher of the Chicago Literary Times (1923-25). Wrote Erik Dorn (1921), Gargoyles (1922), The Florentine Dagger (1923), 1001 Afternoons in Chicago (1923), The Egoist (1923), Humpty Dumpty (1924), A Book of Miracles (1939). In collaboration with Charles MacArthur (Amer nlawwight h. Charles MacArthur (Amer. playwright, b. 1895) wrote the plays The Front Page (1928), Twentieth Century (1933), and the motion pictures Crime without Passion and The Scoundrel. Charles MacArthur, after working on the staff of Hearst's Inter-

Pop. 10,000.

Hecla, see Hekla.

Hectic Fever. This term literally
means habitual fever, and was formerly applied to the regular and recurrent fever of pulmonary tuberculosis, that is, con-sumption. H. F. may be looked upon as an obsolete term in medicine, as it only indicates a condition of weakness.

Hector, Trojan warrior, the son of King Priam and Hecuba, and the husband of Andromache, by whom he had Astyanax.
During the Trojan war he slew Patroclus,
the friend of Achilles. The latter, roused
to anger, drove back the Trojans, but H.
stood his ground, and, in spite of the tears and entreaties of his parents, awaited the approach of the enemy by the Scean gates. At the sight of Achilles he turned in flight and was pursuod three times round the walls of Troy. At last Achilles pierced him with his spear, and, fastening the body nim with his spear, and, hastening the body to his chariot, dragged it through the dust of the city. At the bidding of Zeus, he gave up the body to Priam, who gave it an impressive burial in the citadol. See Homer's Iliad, vi. and xxii., and Virgil's Aineid, 1.

Hecuba, wife of Priam, king of Troy, to whom she bore Hector, Paris, Cassandra, and many others. On the fall of Troy she fell into the hands of Ulysses, and was carried away to Greece as a slave. Thracian Chersonesus her daughter Polyxena was sacrificed by the Gks., whereupon H. revenged the deaths of her many children by killing Polymestor, king of Thrace, who had murdered her son Polydorus. She was pursued, but was changed into a dog and leapt into the sea.

Hedge, fence formed of bushes or small trees growing close together or a line of bushes or evergioens, whether intended as a fence or not. For garden Hs. the oval-leaved type of privet H. is one of the best. It grows quickly and can be clipped with impunity and, in ordinary, good soil it can be planted in close formation. A double row, with plants about 15 in. apart in each semi-row, will become reasonably compact when planted. After a year the plants should be pruned back to half their height to induce a bushy (1928), Twentieth Century (1933), and the motion pictures Crime without Passion and The Scoundret. Charles MacArthur, after working on the staff of Hearst's International Magazine (1924) turned to writing plays and motion pictures and became a partner in the Hecht-MacArthur corporation. He collaborated with Hen Hecht boundary. Holly is also a good hedging in adapting Wuthering Heights for motion presentation, and also collaborated with sidney Howard in Salvation (1927).

Hecker, Isaac Thomas (1819-88), Amer. Rom. Catholic divine, and founder of the

in all soils, those that are sandy or chalky being most quitable. In heavier soils a pening most statistic. In neavier soils agood substitute is the common hornbeam and grows more quickly than beech. Laurel and yew were formerly favourites but only the yew has kept in favour and the deep wall-like neatness of an estab. yew H. is an advantage, though the expensive terror to the common the common that pense is somewhat heavy and available trees are few. Honeysuckle of the Lonicera nitida type have been popular H. plants in recent years. They grow rapidly and are not expensive, but they soon get out of hand unless clipped back sev. times during a season. A honeysuchle H too. during a season. A honeysuckle H. too has the disadvantage of being easily-blown about in rough winds. The abovementioned types by no means exhaust possibilities for Hs. for there are also comfors of various sorts, box and rosemary, escallonias, and Euonymus, coton-

casters and evergreen oaks.

Hedgebote, old term denoting the right

Hedgebote, old term denoting the right of a tenant to cut wood for purposes of repairing hedges, etc., on the land he holds. Hedgehog, name given to sev. species of insectivora, belonging to the family Erinaceido; they are distinguished from their allies by their spines. Erinaceus europæus, the common European H., is generally about 9 in. long, and 4 or 5 in. high: the suit proceds a nextinguished the suit of the suit of the second of the suit of high; the star revel a maximum length of 1 in., are sha ply pointed and grooved along the sides, and controlled by the muscles of the back. The animal can muscies of the back. The animal can roll itself into a ball, britiling with spines, and, thus protected, will sometimes fall from a considerable height. The H. eat-insects, slugs, mice, frogs, young birds, etc., and has been known to attack vipers; it is sometimes domesticated as a protection against vernin. Hibernation with the II. is a matter of temp. Hs. kept in a warm place will continue active througha warm paice will continue active through-out the winter and, with plenty to eat and drink, will take no harm. Even if it sinks into a true torpor the rise of the temp. will rouse the H. again. Young Hs. may arrive at any time from early spring to late autumn, but ordinarily spring litters predominate. The young are been complete with spines, but they are hind and helpless. They grow rapidly, their prickles darken and harden, and thoir eyes open. Hs. may do some damage, and cases are known of coops invaded and chickens killed, but they are invaded and chickens killed, but they are not typical.

not typical.

Hedgeley Moor, tract of moorland in Northumberland, England, situated in the Berwick div., and in the taship. of Beanley, 10 m. W.N.W. of Almwick. It is noted as the scene of a battle in 1463 between the adherents of the houses of Lancaster and York, in which Sir Ralph Percy was killed.

Percy was killed.

Hedge-mustard, genus of plants of the order Cruciferæ. Some species are native of Britain, e.g. the common H., which in its wild state grows plentifully by the wayside to a height of 1½ ft. This has a hairy stem and small pale, yellow blossoms, with a pungent odour. It was formerly used in medicine for catarrh, etc.,

2 ft. apart. The time to cut back is and is now cultivated for domestic April or Sept. A beech H, does not thrive purposes. purposes.

Hedge-nettle, popular name of the species of Stachys (q.v.), a genus of labiate plants found in Europe, Asia, Africa, and America.

Hedge-sparrows, or Accentor modularis, species of passeriform birds belonging to the family Turdidæ; it resembles a sparrow, having brown plumage streaked

with black.

sparrow, having brown plumage streaked with black.

Hedin, Sven Anders (b. 1865), Swedish explorer, b. at Stockholm, son of Ludwig H., chief architect of Stockholm. Educated at Stockholm, Upsala, Berlin, and Halle. His work as an Asiatic explorer detes from 1893, when he began his journey across Asia from Orenburg to Pekin. He travelled via Lop-Nor and Tibet, and the journey took him four years. During these years he explored the glaciers of the Mustaghats, and the mts. around the sources of the Yarkand Daria. In 1899 he made his second Asiatic journey. On this occasion he travelled down the Tarim R. to the Lake Lop-Nor. He then crossed Tibet, travelling S.E., and made two unsuccessful attempts to enter Lhassa. Started on a new journey through China, 1920. He was ennobled by the king of Sweden, 1902. Hous K.C.I.E., 1909. Pals.: Journey through Khorasan and Turkestan (1892), Through Asia (1808, pub. in nine languages), Scientific Results of a Journey in Central Asia (6 vols., 1899-1902), Adventures in Tibet (1904), Trans-Himalaya (vols. i. and ii., 1909), Overland to India (1910), From Pole to Pole (1911), Trans-Himalaya (vol. iii., 1913), With the German Armies in the West (1915), Bagdad, Babylon, Nineve (1917), Jerusalem (1917), Southern Tibet (9 vols., 1917-22), My Life as an Explorer (1925). Hedmark, co. of Norway, on the Swedish border, with Akushus to the S., Opland to the W. and S. Trondelag to the N. Area 10,621 sq. m. Pop. 167,600.
Hedon, a municipal bor. of E. Riding. Yorkshire, England, in the Holdernessparl. div., situated 8 m. E. of Hull. The industries are chiefly agric, and there are large brick-fields. Pop. 1300.
Hedonism, word of Gk. derivation signifying pleasure, hence, in ethical science, the theory that pleasure or happiness of one kind or another is the chief aim in life. Hedonistic theories have been held from the earliest times. According ness of one kind or another is the chier aim in life. Hodonistic theories have been held from the earliest times. According to one view, happiness is the chief good and moral end for each individual; according to the other, the well-being and pleasure of the general community and of all sentient creatures is the main thing to be desired. The earliest and most extreme type is that of the Cyrenaic and Epicurean schools, who taught that the

to modern writers, such as Hume, Ben-tham, and Mill, whose point of view is based on a wider conception of life, and who maintain that the only real happiness who maintain that the only real happiness is that of the community—or, at any rate, the majority; the criterion is society, not the individual. Passing on to the theories of Utilitarianism and Social Ethics, one is confronted by the problem of reconciling and adjusting the claims of the individual with those of society. An important exposition of the theory of Itilitarianism is contained in II Sideimportant exposition of the theory of Utilitarianum is contained in II. Sidgwick's Methods of Ethics, 1871. He associates the hedonistic theory of the moral standard with an intuitive theory of knowledge which utilitarians do not usually had a second of the theory of the original with the contained the second of the theory of the contained the second of the contained the second of the theory of the second of the theory of the second of the contained the second of the contained the second of knowledge which utilitarians do not usually hold. See also J. H. Murhead, Eluments of Ethics, 1892 and J. S. Mackenzie, Manual of Ethics, 1897; J. Watson, Heilmustic Theories, 1895; E. Albee, History of English Utiliarianism, 1902; C. Gore, Philosophy of the Good Life, 1930; H. L. S. Samuel, Practical Ethics, 1935. 1935.

Heem, Jan Davidsz van (c. 1600-84), Dutch painter, b. at Sandrant, or, according to Descamps, at Utrecht, son of David van Heem (c. 1570-1632), a noted stillife painter. One of the pictures of the elder van H. is in the National Gallery, London. The son surpassed his father in the variety of his still-life subjects and in technical equipment and was much the greater artist. He entered the Guild of greater artist. He entered the Guild of Antwerp in 1635 and two years later became a burgher of the city. In 1667 he moved to Utrecht. His paintings chiefly consist of magnificent vases of flowers and fruit and rich garlands against a background of green. Examples of his work are in many Ger. galleries, and at the work are in many ver, galeries, and at the Louvre, The Hague and Amsterdam, and he is also represented in the Wallace Collection, Loudon. His son, Cornelis van Heem (1631-95) was also a painter Heemskerk, Maerten Jacobsz, often called Maerten van Veen (1498-1574),

W. F. Mansell

HERMSKERK: SELF-PORTRAFT painting in the Fitzwilliam Museum. Cambridge. The building on the right of the face is the Colo-seum at Rome.

sentient pleasure of the moment is the Dutch painter, b. at Heemskerk in Holland only good for mankind. This view is studied his art under Cornelisz Willemsz known as Egoistic H. Opposed to this is and John Sohoreel, painters at Haariem. Universalistic H., which owes its growth In his early work he imitated Mabuse, but Dutch painter, b. at Heemskerk in Holland studied his art under Cornelisz Willemsz and John Schoreel, painters at Haarlem. In his early work he imitated Mabuse, but during a visit to Rome (1532-35) he came under the direct influence of the great masters. His pictures are well represented in the galleries of Europe, but in England he is best known by his drawings. His chief works are: a 'Crucifixion' (in the Ghent Museum), 'Judgment of Momus' (in the Berlin Museum), 'Triumphs of Silenus' (in Vienna), and 'St. Luke Painting the Likeness of the Virgin and Child' (at Haarlem).

Hogel, Georg Wilhelm Friedrich (1770–1831), b. at Stuttgart, was the last of the four great Ger. idealist-philosophers of that period, the others being Kant, Fichte, and Schelling (2...). He was educated at the unity of Tubingen, where began his friendship with Schelling, who, although younger by five vary must rank as H.'a friendship with Schrilling, who, accough younger by five years, must rank as H.'s precursor by virtue of his extraordinary precocity—he had put sev. philosophical papers of importance even during his student days. In 1793 H. left Tüblingen, and lived by teaching, principally in Frankfort. But whilst thus engaged, his mind, stimulated by his studies of Wolff, Notte and Plate was showly maturing. Fichte, and Plato, was slowly maturing, and in 1801 he pub. a brilliant comparative critique on the systems of Fichte and Schelling, somewhat to the latter's

advantage. The same year he became a prof., at the univ. of Jena; during the five years that he spent here, he became more intimate with Schelling, and together they issued a philosophical journal. At this time, Napoleon was pressing against the Prussians, and the Battle of Jena (1806) caused the univ. to be tomporally disbanded, with the result that H. had to accept the editorial duties of a small newspaper for a time. Before long, however, he had once more secured an correlation with the idea of evolution. small nowspaper for a time. Before long, however, he had once more secured an appointment as teacher in Nuremberg, and it was during the nine years he spent in that position that he married (1811). Meanwhile, his first work of real significance had been pub., Phanomenologie des Geistes (1807, Eng. trans. The Phenomenology of the Spirit, 1894), and the Wissenschaft der Logik, the first vol. of his delinitive philosophy, followed in 1812 (Eng. trans. Science of Logic, 1894). In 1816 he left Nuremberg for a professorial chair at Holdelberg, where in the same year he produced his great encyclopedia of the produced his great encyclopedia of the philosophical sciences [mzyklopadia der philosophischen Wissenschaften], and two years later he succeeded Fichte in the chair of philosophy at the new univ. of Berlin, a post which he filled with dis-tinction until his death, from cholera, thirtoen years later. It was here that he wrote, amongst many other important works, Grundlinien der Philosophie des Rechts (18°1, i. g. trans. The Philosophy of Itight, 1896). During his later years he was esteemed the leading force in contemporary Gor. philosophical thought.

After his death many of his hitherto
unpublished lectures and essays on
religion, hist., and esthetics were collected and pub. by a circle of his chief
students and friends. Hegelianism must

be studied in relation primarily to the philosophy of Kant. Kant had contended that, whilst the value of an object was purely in the cognition thereof, and not in any degree intrinsic, a dualism existed between that object and the cognition, i.e. between the noumenon and cognition, i.e. between the noumenon and the phenomenon. H., in his development of this idea, evolved the dualism out of consideration by identifying reality with rationalism. Agreeing with Kant that it is impossible to consider life philosophically as a purely material existence apart from essential idea, he urges that reatter is non-registrate event as a personal control of the control of th matter is non-existent except as a per-ception, that is to say, an expression to an individual mind of some essential idea. He therefore proceeds to examine, not the form, but the idea, of thought; since what is true of a perception is true of the object. Hegelianism is thus the outcome of the idealisms of Kant, Fichte, and Schelling, although less remantic and Schelling, although less romantic and land legel als deutscher Nationalphilosoph, more absolute; it is divided into three headings: (a) logic, (b) natural philosophy, (c) philosophy of spirit. The Science of Logic, in which his whole system is traced out, both logically and metaphysically, has been described as the only production of modern thought worthy to rank with the Metaphysic of Aristotle; in it, H. analyses and systematises the fundamental conceptions that

moral and abstruct element of the work in correlation with the idea of evolution. Apart from the purely scientific significance of H.'s writings, they contain much of importance on religion and the esthetics of art. In religion, he was influenced chiefly by Fichte's subjective idealism. His views on art are of great interest; to him, art is a thing apart from nature, for he holds that, since art should average idea in superstiction. should express idea in sympathetic form, nature is not intrin-ically or necessarily beautiful, but is dependent for its boauty on individual perception. He classifies art, on this basis, into: (1) Symbolic, wherein the expression of indefinite ideawherein the expression of indefinite ideas is attempted on a colossal scale (e.g. Oriental architecture); (2) Sensnous or Classical, which is best exemplified in Gk. sculpture (the pagan esthetic of idealised humanism); and (3) Christian Art, a return to the symbolic in style of idea, vague and indefinite in its concept of minity and omnipotence, but more exquisitely expressed in the narrower limitations and more plastic media of painting, music, and poetry. H.'s teachings were subsequently developed in two directions, one of them on the lines of his own idealism, the other leading to arrant positivism. Of these the latter is more powerful, and tends to atheism and radicalism under Strauss, Feuerbach, and Bruno Baur, who claim their systems to be directly evolved from H., in spite of the orthodox and conservative sympathies the orthodox and conservative sympathies

the orthogonal and conservatively measured in the professed.

H.'s philosophy was the basis of the metaphysical speculations of Karl Marx, and his idealisation of the state may be said to be the underlying principle of the state of Factor (i.e. up this Cross. ideology of Fascism (see on this Cross-man's Plato To-day). It is not without interest to note that in the opinion of man's Plate To-aun, in the opinion of meterest to note that in the opinion of Netzsche, the name of Netopenhauer was better known than that of H., and yet that Schopenhauer, unlike H., was none-theless a solitary being, who had failed of his effect. His cou plete works were pub. in 1832-15 (18 vols.) and in 1927-40 (26 vols., ed. by H. Glockner). See J. Hutchmson Starling, The Secret of Hegel, 1865; Lectures on the Philosophy of Law, 1873; J. Rosenkrantz, Hegel's Leben, 1844; Hegels Adurphilosophie, 1868; and Hegel als deutscher Nationalphilosoph, 1870; C. Kostlin, Hegel, 1870; F. W. (vol. ii.), 1928; C. Nink, Hegels Phanomenologie des Geistes, 1931; K. Lowith, Von Hegel bis Nietzsche, 1941; T. M. Kaox (ed.) Hegel's Philosophy of Right, 1942.

Hegesias, Cyrenaic philosopher, lived in the reign of Ptolemy Philadelphus (309–246 B.C.) and was a disciple of Parsebets. In the main he taught the dectrines of Aristippus, the founder of his school, but he so ingrained in his pupils an indifference to life and a contempt for death, and at the same time the belief that it is idle to look for happiness where the soul is for ever imprisoned in a suffering frame, that he drove many of them to suicide. This be drove many of them to suicide. This gloomy tendency of his teaching became so alaxming that Ptolemy is said to have put a stop to his classes. H. further maintained the wisdom of complete egoism and the instability and unreality of such figments of the brain as kindness and triendship. and friendship.

Hegesias (fl. c. 250 B.c.), Gk. historian of Magnesia who enjoyed great repute as an orator. Cicero refers to him and mentions how he spoilt the pure Attle Gk. by the heedless adoption of Asiatic

idioms.

Hegesippus (c. 350 B.C.), Athenian statesman and orator, and a staunch supporter of the anti-Macedonian policy of Demosthenes. He became one of the ambassadors to Macedonia in 343 B.C., whose mission was principally to discuss the restoration of Halonnesus. In con-

nection with this subject, H. delivered his famous oration ' De Halonneso.'

Hegesippus (c. A.D. 120-180), early Christian writer, of Palestinian origin, lived under the emperors Antoninus Pius, Marcus Aurelius, and Commodus. It is a disputed question whether he was a Judalstic Christian or not. He wrote a treatise, Five Memorials of Ecclesiastical affairs, on Christian literature, unity of church doctrine, paganism, hereey, and Jewish Christianity, fragments of which are found in Eusebius. From Eusebius we learn that H. journeyed to Rome, visiting Corinth on the way. He compiled a list of the Rome, bishops down to Anicetus (A.D. 156-67), and is looked upon as the father of church hist. See M. J. Routh, Reliquice Sacræ, 1814-18; and J. E. Grabe, Spicilegium, ii., 1711. Hogira, see HEJIRA.

Hegyalia, or Hegyaliya, range of hills which runs S. between the valleys of the Bodrog and Hernad R., in N. Hungary. An extreme offshoot of a Carpathian spur, they are in the midst of the dist. where the

Tokay wines are produced.

Helberg, Johan Ludvig (1791-1860),
Dan. dramatist, was the son of the celebrated novelist who afterwards became Baroness Gyllembourg-Ehrensvard, and of the political writer Peter H., who was of the political writer Peter H., who was exiled in 1800. He attended Copenhagen Univ. and began publishing in 1814, when he brought out two romantic dramas. However, both in his satire, The Prophecy of Tycho Brake (1817), and later, when he ed. Kjöbenkanns Flyrends Post (1827–30), etc., he persistently mocked at the exand sentimentalism of Ingemann

and other popular Romanticists. A comedy entitled A Soul after Death (1841) and

comedy entitled A Soul after Death (1841) is one of the best things he wrote, whilst a little play celled The Nut Crackers (1845) contains his most pungent satire.

Heide, tr. near the N. See, 34 m. N.N.W. of Chickstadt, in Schleswig-Holstein, Germany. Pop. 11,800.

Heidegger, Martin (b. 1889), Ger. philosopher. He came into prominonce in 1928 when he pub. his chief contribution to philosophy, Time and Being. In 1933, when he was rector of Freiburg Univ., he owed allegisnee to Hitler's party; but, thinking he had made a political error, he relinquished the rectorship in 1934 and, in 1935, having reached the peak of his relinquished the rectorship in 1934 and, in 1935, having reached the peak of his fame, he was invited, but declined, to become rector of Berlin Univ. Though his reputation stood high in Germany hefore the war, it did not then, apart from philosophers, spread internationally, and yet to-day, when his influence is marked in many foreign countries, it is almost non-existent in his own. H's philosophy has been described as atheistic existentialism, mainly because his Time and Being is concerned essentially with the problem of being-in-the-world; but he himself repudiates any connection with existentialism (g.r.), with Sartre (g.r.) or even with Kierkegaard. By existence H. means man's determination to 'stand out into the truth of being' or in other words, into the truth of being 'or in other words, to pierce the meaning of his evistence. If man fails to transcend the limits of his world he is condemned to death and nothingness. He must experience the anguish of nothingness, he must first exist in the nameless, not for its own sake, but so as to realise that this nothingness is the path to being. But the problem whether a man shall be or shall not be is an event that takes place in the experience of dread. The struggle with this dread determines whether man shall annihilate nothingness and thus perceive its other side, that of being; or whether nothing-ness shall annihilate man. H.'s nihilism is comparable with Dostovsky's interpretation of suffering, which to the Russian writer, not only awakens con-scious thought but also has the power to redeem evil. H. is atheistic in the sense that he believes that God is absent from the world as well as that man has lost his dignity; whether God will reappear and man regain his dignity, has no place in H.'s philosophy, other than the consideration of the possibility of a God and of man's dignity. Both these possibilities reside in being as such, and being is above the human and above the divine. This much discussed philosophy may therefore be regarded as a part of Ontology (q.v.) in the sense in which Wolff defines it—that part of theoretical philosophy which deals with being in general as opposed to particular entities. The bulk of H.'s writings, including the second part of Truth and Being, as well as books on Nietzsche, Nihillsm, and Logos are still in manuscript and unpublished. See A. Fischer, Die Existeaphilosophie Martin Heideggers, 1935; A. de Waelhens, La Philosophie de Martin Heidegger, 1946. the human and above the divine. This

Heidelberg, tn. on the l. b. of the Neckar some distance from its confluence Neckar some distance from its confluence with the Rhine, 64 m. by rail from Frankfort-on-Main, and 12 m. E.S. E. of Manheim in Baden, Germany. The chief glory of the picturesque old city, which is guarded by the forest- and vine-clad slopes of Heiligenberg and Konizsstuhl. is the castle, which looks down on the riv. from a summit of over 300 ft. Begun in the thirteenth century, the castle was still being enlarged and beautified in the seventeenth century, but was partially blown up by the Fr. in 1689. In 1764 it was struck by lightning and was reduced to its present state of graceful ruin. The huge vat, known as the Great Tun of H, which has a storage capacity of 46,732 gallons, is entered from the castle courtyard. The famous univ. was founded in 1385 (or 1386). From here during the Reformation period Calviniet dectrines were dieseminated far and wide, but for the thirty wears of use (1518-48) its bist netorniation period (avenue doctrines were diseninated far and wide, but for the thirty years of war (1618-48) its hist. is almost a blank. The valuable library which Otto Henry began to collect, and which has at different times been housed which has at different times been housed in the Vatican and at Paris, now contains about 4000 MSS., 3000 papyri, hesides over 500,000 vols. Hitler founded two new chairs at the univ. of H. one of folk list. or 'folklore,' and the other to direct the study of the hist. of the art of war. These two swhicet, were both branches of study in which the 'azis had a special and peculiar interest, and with the closing after the war of these two depts of the univ. what seems to have been the of the univ., what seems to have been the Nazi party's sole positive contribution to the academic life of H. was brought to an end. A number of former profs. who had been dismissed by the Nazis were brought back to the univ. by the allied occupying authorities. H. is not only the oldest ther. Univ., but also in its hist, it has a name famous for religious reform and generally reforming thought, and it is probably for those reasons that the Nazis selected H. to be above all others the home of Nazi culture and ideas; but not-withstanding this pollution, something of the old tradition of H. lived on under the Nazis and was a useful foundation on which to bring about the univ's restoration after the war, though the mental desert left by the Nazis presented a desolate prospect. H. was practically untouched physically by the war, save for the pink stone bridge which was cut in the middle and all the univ building. in the middle, and all the univ. buildings were intact, but the problem was how to recreate a clean untainted academic life recreate a clean untainted academic life within the buildings; for the real problem of all the Ger. univa. after the war was not merely to re-educate their students but to start teaching again from the beginning the actual habit of thought. There is an excellent observatory on the Konigsstuhi (built in 1894), and among the antiquities of interest are the Protestant Peterskirche, where Jerome of Prague pinned up his theses in 1160, and the fine Gothic Heilige Geist Kirche, which also dates from the iffteenth century. H. 13 of some commercial importance, more of some commercial importance, more especially as trunk lines radiate to Karls-

ruhe, Würzburg, Mannheim, and Speyer, besides to Frankfort. The first president of the Ger. Republic (1919), Friedrich Ebert, was b. at H. Pop. 84,600.

Heidelberg, name of a tn. (58 m. S. by E. of Pretoria) and dist. of the Transvaal, S. Africa. The tn. lies 5029 ft. above the sea on the slopes of the Rand, and was founded in 1865. Besides being a health resort it is a gold-mining centre for the Witwatersrand fields, etc. Coal is found in the neighbourhood. Pop. (European) 2600; (other) 4500.

Heidelberg Man, remains, lower jaw and teeth, of a sub-man of the Pleistocene Age found, in 1907, at Mauer on a trib of the Rhine. Anthropologists regard the

Age found, in 1907, at Maner on a trip, of the Rhine. Anthropologists regard the remains as being of a later period than the famous Piltdown man (q.v.) though earlier than the Neanderthal. See O. Schoetensack, Der Unterkiefer des Homo Heidelbergensis, 1908.

Heidenheim, tn. in Wurttemberg, Germany. It was once an anct. Rom. settlement. The ploturesque ruined castle commands the tn. Pop. 24,000.

Heidenstam, Carl Gustaf Verner von (1859-1940), Swedish man of letters; b. at Olshammar in Nerlke prov. of noble parentage. As a boy he had to travel for his health, and saw Greece and the E. At Rome, he was for two years pupil to the Swedish painter Kronberg; he studied also at the Ecole des Beaux Arts, Paris. He then lived some years in Switzerland, and returned to Sweden, where he developed as a painter in words matend of pigments. The greater part of his work consists of poetry and short tales. He wrote only one book that can of his work consists of poetry and short tales. He wrote only one book that can properly be called a novel—kndymion (1889), a story of the E. His famous Karolinerna (1897-98) is a collection of tales about Charles XII. Some of his other works are: Vallfart och Vandringsår (poems. 1888). Från Col di Trada till Blocksberg (sketches, 1888), Renasans (1889), Dikter (poems, 1895), Tankar och Teckningar (1899), Sankt Gören och Druken (1900), Folke Filbyter (peasantlegend, 1905). Bjalboarnet (sequel to Folke Filbyter, 1907), Folkungatradet (1905-07), Srenskarna och deras hördingar (the Swedes and their Chiefs, 1908-90), Stridskrifter (1912), Nya Dikter (1915), Dikter—Hed raderingar av Jurgen Wrangel (1927). H. stands for colour and romance as against stands for colour and romance as against such realism as that of Strindberg. was of aristocratic and anti-levelling temper. He received the Nobel Prize in 1916 and the Hearlk Steffens Prize in 1938. A new Eng. trans. of Karolinerna, called The Charles Men, appeared in America in 1920.

Heifetz, Jascha (b. 1901), Polish violinist. Heifetz, Jacha (b. 1901), Polish violinist, b. in Vilna, studied at the St. Petersburg conservatoire, and made his first public appearance before he was five years of age, at Vilna, and in Petrograd at ten. Has played with phenomenal success in Germany, Austria, and the U.S.A.

Heijermans, Herman (1804–1924), Dutch novelist and dramatist, b. at Rotterdam. As a young man he was a frequent contributor to Amsterdam jours, under the pseudonym of 'Samuel Falkland.' He

subsequently made a marked success with |

subsequently made a marked success with novels and social dramas.

Heibronn, manufacturing tn. of Württemberg, Germany, on the Neckar, 33 mby rail N. of Stuttgart, having fine views of mts., the Black Forest, and the Voeges. It is an anct. tn. of historical interest, containing many old buildings, such as the Gothic church of St. Kilian, a Rathaus, the Gotzenthurm, and Schonthaler Hof, as well as fine modern buildings. It has reminiscences of the Emperor Charles V., Götz von Berlichingen, Gustavus Adol-Götz von Berlichingen, Gustavus Adol-phus, and Schiller. The chief manufs. are phus, and Schiller. The chief manufa are chems., machinery, paper, sugar, sait, cigars, coffee, etc. At H. the Gers. defended the Neckar line against the Amer. Sixth Corps for some days and then fought in the tn. for a week before it was cleared on April 12 (1945). Pop. 77, 200

it was cleared on April 12 (1945). Pop. 77,600.

Heil Dir im Siegerkranz,' Prussian national anthem. The words are by Balthasar Gerhard Schumacher, and the music is that of 'God save the King.' John Bull's Ayre, 1619, is an early version of the same tune, but the music as it is now sung first appeared in 1745, the reputed composer being Henry Carey.

Heilsberg (Polish, Lidzbark Warmiński),

Heilsberg (Polish, Lidzbark Warmiński), tn. of Poland (formerly E. Prussia) with dye works and tanneries, 39 m. S of Kaliningrad (Königsberg), it is situated at the confluence of the Alle and Simser. There is an old castle. Pop. 4200.

Heilsbronn (also Kloster-Heilsbronn), vil. 16 m. S.W. of Nuremberg by rail, in Middle Franconia, Bavaria, Germany. It is famous for the Cistercian monastery which Bishop Otto founded in 1132, and which f. until 1555. High interest attaches to a series of sepulchral monuments to members of the Hohenzollern family, and also to the church, which is a family, and also to the church, which is a basilica in the Romanesque style. Pop. 1700.

Heilunkiang, prov. of Manchuria, containing 25 cos. with Pehan as cap It is an elevated region with an area of 765,000 sq. m. The most important products are timber and gold. Pop. 2,564,000.

Heimdellr, in Norse sythology, the d of light. He guarded the frontiers of god of light. He guarded the frontiers of Himinbjorg (heaven) and the rainbowthe giants. Like Oliver Hoder of Teu-tonic myth, his hearing was so acut that he could hear the grass grow. Always in mortal feud with Loki for the recovery of Freyra's tolen necklace, and ultimately

they slew each other.

they slew each other.

Heine, Heinrich (1797–1856), Ger. poet and journalist, b. at Düsseldorf of Jewish descent. He was editor at the Lyceum in Düsseldorf, and began life at Hamburg in the banking business of his uncle, Solomon H., with whose daughter Amalie he incidentally fell in love. On account of his failure in business, his uncle sent him to study law at Bonn (1819), where he gave signs of literary talent—A. W. von Sohlegel being one of his earliest admirers and advisors. In the following year he left Bonn for Göttingen, but before long became entangled in a duel, and found it

advisable to leave there also. Arriving in Berlin, he was soon an eager student of Hegel; his new environment and friends, including Fouqué, Rahel, Chamisso, and the Humboldts, stimulated his genius, and the first vol. of *Gedichte* appeared in 1821. Turning again to law for a while for the poor success of his tragedles Almansor and William Ratel of (1823) had discouraged him—he graduated in 1825. discouraged him—he graduated in 1825. The same voar he spent a holiday in the Black Forest, thereby gaining the material for the first vol. of Resebilder (1826), which attracted much attention by its originality and brilliance of style. Meanwhile, he had become bapticed in the Christian faith, purely, however, for social purposes. The next few years were spent visiting London, Murich, and Italy: the visiting London, Munich, and Italy; the

HEINRICH HEINE

remaining three vols. of Reischilder were pub., and also the Buch der Lieder (1827). After another visit to Berlin (1829) and a brief sojourn in Hamburg (1829-31), H. made Paris his home, quite severing his ties with Germany; and he only revisited if for short periods in 1843 and 1847. In Paris—'the new Jerusalem'—he was welcomed by the brilliant romantic circle—Hugo, George Sand, De Musset, Gautier, Sainte-Beuve, Chopin, Berlioz, and Delacroix; and he settled down to journalism and letters, De l'Altemagne (1835), and Die Romantische Schule (1836), being his chief works of this period. He first met 'Mathilde' in 1834—Eugenie Mirat (d. 1883), a shop-assistant—first his mistress and subsequently (1841) his wife; After another visit to Berlin (1829) and a mirat (d. 1883), a sinop-assistant—first his mistress and subsequently (1841) his wife; and, sithough it is hard to understand the fascination of a hadly-educated, shallow minded grissite for H.'s sensitive artistic soul, their mutual devotion was certainly unwavering. During H.'s early years in Paris, his uncle had allowed him 4000 france a wear, but his growing sensation. france a year, but his growing separation

from the Hamburg family made it necessary to look elsewhere for support, and from 1837 to 1848 he was in receipt of a pension of 4800 francs from the Fr. gov.—ostensibly as a political refugee, although he was not associated with the young Gor. party whose revolutionary ideas had exiled them to Paris. This was the last step in his absolute self-alienation from his compatriots; his writings had already been condemned by the Frankfort Confederation Parliament (1835). Der Salon (4 vols.) appeared between this time and 1840, including his famous essays, 'German Philosophy and Literature,' written for the literate des Deux Mondes. Deutschland, a political satire in verse, was pub. in 1844, and Atta Troll, 'the Swan song of Romanticism,' in 1847. From 1848 to 1856 H. was a victim to spinal disease, but through the agonies of this last long illness, during which Mathilde nursed him devotedly, he retained full control of his mental faculties, as his ktomanzero (1851) and Neuste Gedichte (1853–54) bear witness. His Memoirs were probably destroyed; at any rate, they were withheld from pub. for family reasons, when in 1847 his Hamburg pension was restored; doubtful fragments were pub. in 1884, but their importance is as slender as their interest. During the Nazi regime (by 1910) all the works of H. were banned in Germany. H. gave a ptophecie warning to France of the revolutionary forces at work in Germany, in a passage which appears in his Religion and Philosophy. (The book was pub. in 1835, but the passage in question was deleted from the first Ger. ed. by the Prussian censor and appeared only in Fr. truns).

H.'s genius was moulded by his Ger. birth, Jewish descent, and Gk. culture; Nietzsche wrote that H. and himself were the greatest literary artists Germany had ever produced. He was the grant maitre of lyric expression; for his sense of the tragic and the heautiful was passionately intense. Gautier says that 'Heine combined the purest Gk. form with the most exquisite modern inspiration; he was a true Euphorion, the child of Faust and lovely Helen.' His work is the emotional panorame of a soul almost neurotic in its exquisite sensitiveness, its keen appreciation both of beauty and ugliness, of joyand despair. And his style is equally nervous in his portrayal of them both; on the one hand, the lyric-idealist, sometimes sentimental to a degree bordering on the ridiculous; on the other, the bitterly ironical cynic, often malicious mis satire, merciless and irreverent to the most sacred feelings of others. But, confining attention to broader issues, he was the first and greatest of a type of which, unfortunately, a medicere multitude has since arisen; a self-centred, narrow soul, of artistic and irritable temperament, aiming at hedonism, fretting at the rem of reality, a poet of happy Illusions that bring but sadness. Whilst expressing disfavour of Romanticism, he was one of its leading exponents; and whilst often coarse and brutal in his attitude towards

love, he was yet conscious of the supreme poetry of passion. Indeed, it is as the poetic psychologist of love that H. is pre-eminent; his Lyrisches Intermezzo (1823) and other poems have a wonderful fascination for translators, and have been set to music by nearly all the great song-writers—Schumann above all, Liszt, Rubinstein, Brahms, and Grieg. H.'s idealism towards life was a sanguine hope for the brilliant and glorious future of mankind—a future to be realised by fostering imagination and exsthetic culture. A Fr. ed. of his works was pub. by H., De Nerval, and others (14 vols., 1852—68); other eds.: (Ger.) A. Strodtmann (21 vols., 1861—66), E. Elstor (7 vols., 1887—90), and O. Walzol (10 vols., 1892—1905). See lives by A. Stroatmann, 1873; W. Stigand, 1875; W. Sharp, 1888; and M. J. Wolff, 1921; olso J. Weldekampf, Traum und Wirklichkeit in der Romantik und bei Heine, 1932; F. H. Wood, Heine as a Centre of his own Work, 1934; L. Marcuse, Heinrich Heine, a Life between Past and Future, 1934.

Heinkel, Ernst (b. 1888), Ger. aircraft designer, b. at Grunbach, Wurttemberg. Founded the H. Aircraft works at Wassemunde in 1922, first developing wearship models of seaplanes, and later light, fast, passenger aircraft. His fighter (H.E. 113) and twin engine bomber (H.E.

(H.E. 113) and twin engine bomber (H.E. 111), and other types, were used by the Luftwaffe in the Second World War. Heinrich von Meissen (1280-1318), Ger. tyric poet and wandering singer, b. at Meissen of humble burgher parentage. He is generally known by the name of Frauenlob, a nickame which may allude to his songs in praise of women, though some engest that the reference is to his some suggest that the reference is to his song, Die Heilige Jungfrau, or again to a song in which he defends the use of the word 'Frau' instead of 'Weib.' His youth was passed in straitened circumstances, but he gradually won a reputation stances, but he gradually won a reputation as a singer at the courts of the Ger. princes. In 1278 he was in the army of Hapsburg, and in 1286 at Prague at the knighting of Wenceslaus II. It is said of him that he founded the first school of Meistersingers at Mainz. He died at Mainz, and the women of the city bore him to his grayer in the clotzers of the him to his grave in the cloisters of the cathedral and erected a monument, by cathedrai and erected a monument, by Schwanthaler, to his memory. See F. H. Von der Hagen's Minnesinger (vol. iv) 1838; A. E. Kröger's Eng. trans. of his Cantica Canticorum, 1877; and H. Kicsling, Die Lithik Fraucalobs, 1926.

Heinse, Johann Jakob Wilhelm (1719—1893). Ges parallet translates and see the cast of the control of the control of the control of the cast of the cast

1803), Ger. novelist, translator, and art critic, b. at Langewiesen, Thuringia. He was a disciple of Wieland, and had some influence on Goethe He studied art in Italy, where he also trans. Tasso's Gerusalemme Laberata and the Orlando. His masterpiece, Ardinghello (1787), contains remarkable digressions on the plastic arts, remarkable digressions of the plastic arts, and another romance, Huldegard rom Hohenthal (1796), gives his ideas on music. He served the elector of Mainz, and became state librarian. See J Schober, Henne, sen Leben und II'erke, 1882, and studies by A. Zippel, 1930; and A. Leitz-

mann, 1938.

Heinsius, Anthony (1641-1720), Dutch statesman and confidential agent of Win. Prince of Orange, b. at Dolft, and studied law at Leyden. In 1688 he was grand pensionary of Holland and guided Dutch politics until his death. In his zeal for the enmity of France.

Heir. The H. in Eng. law was the per-

Heir. The H. in Eng. law was the person who took by descent (q,v) the lands, tenements, and hereditaments (q,v) of another, the ancestor. There were also the by custom, who were entitled by certain customary modes of descent to succeed to customary freeholds, a peculiar species of copyhold tenure, which prevailed in the N. of England, and within manors of the tenure of anot. demente, or tenure by copy of court roll, but not expressed to be at the will of the lord of the manor. As noticed in the article Inheritance, the H. was an uncertain person till Nejd on the E., and on the S. by Asir. Its

the death of the ancestor, on the principle that no one is the H. of a living person Before the ancestor's death, a person could only be an heir-apparent, i.e. one whose right is certain and indefeasible, provided he outlived the ancestor and the latter d. without making a will at all, or d. intestate as to some part of the real property; or an heir-presumptive, i.e. one who, if the ancestor should die immediately, would ancestor should die immediately, would succeed as H., but whose right to succeed night be defeated by the contingency of a nearer H. being b.; e.g. an only daughter's presumptive right would be defeated by the birth of a son. (For the former rules of descent in Eng. law to real former rules of descent in Eng. law to real property, see under INHERITANCE.) The old rule of primogeniture has disappeared, and with it the equality old institution of the heir-at-law; but for the purpose of tracing title to real proporty, it is still essential for lawyers to know the old law. The term H. is still used popularly to denote the Hs. to the throne or to a title Haricom (A.S. Lown, limb or member)

Heirloom (A.-S., loom, limb or member). Hs. are those personal chattels which, by special custom, descended on death with the freehold lands of inheritance with the occupation of which they are connected; whereas ordinary chattels devolved on the executor for distribution amongst the the executor for distribution amongous anext of kin. To-day such lis. are practically unknown, and the word is used popularly to denote pictures, furniture, jewels, etc. vested in trustees to hold for the person who for the time being is entitled to the possession of a settled noticed to the possession of a settled home and are known as settled chattels. By the Law of Property Act, 1925, the rules as to the settlement of real and personal property are assimilated. The former special devolution of Hs. is indicated by the name itself, which, according to Blackstone, is derived from loom, a limb or member, and signifies a limb of the inhoritance. Deer in a park, fish in a pond, doves in a dove-rot, accompany heritable lands, and, similarly, crown lewels are said to be ils. Charters' courtrolls (evidences of title), and deeds, chests in which muniments of title are contained. also passed as Hs., and also things affixed to the freehold in such a way that they cannot be severed without damage, c.g chimney-pieces, benches, etc. Monu-ments or tombstones in a church, and coat-armour, pennous, and other insignia of honour of the ancestor, although hung up in a church, formerly passed as Hs. to his heir. Hs. could not be devised by will away from the heir. but under the Settled Land Acts, the court might sauction the sale (or purchase) of Hs.

length is 750 m., and its greatest width 200 m. Its coastline on the Red Sea is 800 m. and its area is about 112,500 sq. m. The pop. is unknown, but is variously computed at 1,500,000 to as much as 3,000,000. It is stony and altogether There have been twentythree eruptions desolate in character. The Tehama range traverses it, of which the chief summits are Jebel Shar (7000 ft.) and Jebel Radhwa (6000 ft.). The form of gov. of the Kingdom of Saudi Arabla is patridade where the same of Marked 19,1947, was preceded are hall, being in this respect in marked by an earthquake and showered dust on archal, being in this respect in marked contrast to that of Iraq (q.v.), which, under the Brit. mandate, became assimi-lated to W. models. The local or Sharian law is administered by local cadis under law is administered by local casts under chief shalks resident at Riyadh (in the Nejd) and Mecca. The chief tas. of the Hejaz are Mecca (pop. about 80.000), Jiddah, the pilgrims' port (pop. about 30,000), and Medina ('the city'), the terminus of the Hejaz railway, and famous at the burief place of Mahomet. With a terminus of the Hojaz ranway, and lamous as the burial place of Mahomet, with a pop. of about 20,000 (see MEDINA). The chief products of the II. are dates, hides fruit, honey, wool and ghi (clarified butter). Jiddah does a fair trade in hides, butter). coffee, mother-of-pearl and carpets, but the products are mainly for domestic con-sumption, and the revenue is derived. apart from that drawn from dates, chiefly from the famous if declining pilgrimages. In 1939 the number of pilgrims to Mecca was nearly 6°,000. Medina is connected with Annuan in fram-jordan, and 13 800 m. by rall from Damascus. The H. railway connects with the Bagdad railway at Aleppo (q.v.). The Palestine railway authorities administer the section from Maan to Amman. There are no roads, properly so called, in the H. From Jiddah to Mecca (15 m.) a road through the hills is in some parts metalled. There apart from that drawn from dates, chiefly the hills is in some parts metalled. There is also a track from Mecca E. through Riyadh to Uqair on the Persian Gulf a Riyadh to Uqair on the Persian Gulf a distance of 820 m., which is used for motor transport: and a similar route connects Jiddah with Medma via Rabigh. Small ports on the Araban coast are El Wijh, Yambo-el-Bahr, Rabigh and Jiddah (or Jedda), which contains the reputed tomb of Evo, mother of mankind. The easis of Khaibar, E. of the railway, has large aren, counsting of the descendants. a large pop. consisting of the descendants a large pop. consisting of the descendants of former negro slaves, with a centre at Kasr el Yahudi. Abdul Aziz ibn Saud, Sultan of Nejd, having thrown off the Turkish yoke before the First World War, completed the conquest of the H. in 1926, the kingdom of the Hejaz and Nejd Arabia. The unification of Ibn Saud's dominions under their joint name of Saudi Arabia was effected by a decree of Sept. 22, 1932. For the hist, of the H. (and Nejd) in the First World War, see ARABIA.

Hejira, and after Hejra, or Hegira ('flight,' from Arabic hajuru, to go away). signifies the tlight of Mohammed from Mecca on Sept. 13, A.D. 622. Since the institution of the new Moslem calendar by

68 m. E. of Reykjavik. Elevation 5108 ft. There have been twentythree cruptions since the ninth century, the last in 1947. By the outbreak of 1845, fine lava ashes and dust were scattered as far as the Orkney Is. 500 m. away. The next cruption of March 29, 1947, was preceded by an earthquake and showered dust on Copenhagen, 1,250 m. away.

Hel, or Hela, in Scandinavian mythology, was the daughter of Loki and of the glantess Angovrhoda. She below the roots of the sacred ash Yggdrasil. She ruled over the nine worlds of Helheim, the ahode of the dead, and of the old and sick. After

of the dead, and of the old and sick. After the introduction of Christianity, her dwelling-place became synonymous with hell, the abode of the wicked dead.

hell, the abode of the wicked dead.

Helbou, see Aleppo.

Helder, Den, seaport at the N. extremity of Holland, situated on the Marsdiep at the enfrance of the Zuider Zee. There is an excellent harbour at Niewe Diep, the E. side of the tn., and there are fine embankments. The great Helder Dyke, constructed of Norwegian transfer is 5 m. long and there is a great grante, is 5 m. long and there is a good road along the top of it. It is an important naval and military station. H. has ant naval and military station. H. has also an observatory, lighthouse, zoological station, and tn. hall, etc. It was first iortified by Napoleon in 1811. The Dutch fleet, under De Ruyter and van Tromp, defeated the king. oif the coast in 1673. H. may be said to have marked the Dutch for N. end of the constant blockade which Allied naval forces maintained without interprution throughout the without interruption throughout the second World War from the Biscay and Channel coasts, from the Gironde to Den Helder. Pop. 31,500.

Helen, or Helena, heroine of the Trojan War and the most beautiful of women. She was the daughter of Zeus and Leda, and the sister of Castor and Pollux. She was carried off by Theseus to Attica, but was rescued by her twin brothers. She chose Menelaus out of many suitors, but subsequently descrited her husband and lied with Paris to Troy. This led to the Trojan war, which lasted for ten years. After the death of Paris she married his here the death of Paris sne married nebetrother Delphobus, whom she later betrayed to the Gka, and returned with Menclaus to Sparta. According to one tradition, on the death of her husband she married Achilles and lived with him in

Helena: (1) Co. seat of Phillips co., Arkansas, U.S.A., situated on the Missis-sippl at the foot of Crowly's Ridge, 50 m. S.W. of Memphis, Tennessee. It is served by three railways and is a port of entry and the head of navigation for ('llight,' from Arabic hajura, to go away), entry and the head of navigation for signifies the tight of Mohammed from Meoca on Sept. 13, A.D. 622. Since the cotton-seed products and lumber. Pop. institution of the new Moslem culendar by 8500. Helland, The (O.E. Hælend, Saviour),
ninth-century old Saxon poem of the life
of Christ. The best texts are the Cotton of Christ. The bost taxts are the Cotton MS, in the Brit. Museum, and the Munich MS., which are printed side by side in Slever's ed., 1877. From internal evidence modern scholars have concluded that it was written by the author of the

Rom. Catholic institutions of St. Aloysius and St. Vincent, and others. It is a large commercial centre, with lumber and guartz mills. There are gold, silver and iron mines in the dist. Pop. 15,000.

Helena, St. (Flavia Julia Helena) (c. 247c. 327), wife of Constantius Chlorus, and the mother of Constantius Chlorus, and the mother of Constantine the Great. She is supposed to have discovered the holy rood and sepulchre of our Lord at Jerus and sepulchre of our Lord at Jerus and sepulchre of constanted on the constant of planes can now do so. The principle of the II. is partly adopted in the gyroplane, an appliance that not only has the four rotating planes set at angles to gain an upward movement, but is also equipped with a screw that drives the whole machine against the air, thus gaining some of the advantages of the aeroplane method. Hs. were introduced experimentally in 1948 for the collection and delivery of mails by the lift. Post Office and in 1949 for the transport of goods and building materials to places inaccessible by road. Research to places inaccessible by road. has been devoted recently to the applica-tion of jet propulsion to Hs., where the lifting rotor is driven by ram jets mounted at the blade tips.

at the blade tips.

Heligoland, or Helgoland, an is. of Germany, in the N. Sea, lying 40 m. N.W. of the mouth of the Elbe, and 28 m. from the nearest point on the mainland. It was once a Brit. possession (1807-90), and was ceded to Germany (1890) in return for concessions in E. Africa, being formally incorporated in the Frussian prov. of Schleswig-Holstein in 1812. The is. is an long, its greatest breadth being less than a third of a m. It is a rocky plateau, with a sand bank, the Dünsen-Insel, of the E. coast. On three sides the is. rises nearly perpendicularly from the is, rises nearly perpendicularly from the sea, forming a grass-covered triangle called set, forming a grass-covered triangle called the Oberland. It is a popular bathing resort. In accordance with the treaty of Versallies (1919) the fortifications, military estabs. and part of the naval harbour were, or were supposed to have been, razed. But the 12-inch guns of the Schroder Battery came out of the old battle cruiser Derfflinger, which was also supposed to have been demolished with her armament. II. provided one typical instance of the cursory way in which the disarmament of Germany was conducted after the First World War. Many of the tunnels were bricked up across the en-trances by the Gers, and faced with care-MS. in the Brit. Museum, and the Munich MS., which are printed side by side in Slever's ed., 1877. From internal evidence modern scholars have concluded that it was written by the author of the fragments of a version of the story of Genesis which, with the H., is all that survives of Old Saxon poetic literature. Helicon, mt. range in Bcotla, Greece, situated between the gulf of Corinth and Lake Copals. It is celebrated in classical literature as the abode of the Muses; near by were the fountains, Aganippe and Hippocrene, which were said to give poet inapiration. The W. summit, Palæovoun, rises to 5000 ft.; the E. summit is called 225078.

Helicopter. Type of aeroplane in which the machine is equipped with one

of the fortress had by then been destroyed, and only the enormous labyrinth of underand only the chormous hapyrinth of under-ground workings romained. There were in 1945 more than 8 m. of tunnels; the lowest, lined with Eng. brick, was con-structed when II. was a Brit, colony. All the Ger.-built tunnels were lined with concrete, the most modern being made in 1940 by 25,000 conscripted labourers. The U-boat pens were often hit by bombs but only chipped. The power-station was protected by a great concrete bunker under the oliff. During a big raid just belore the Ger. surrender the old tn. on before the Ger, surrender the old tn. on the Oberland and the residential quarter on the flat land below were obliterated. The only structure on the Oberland to remain infact was the control tower of the great fort. The fortifications of H, were blown up by the R.N. on April 15 (1947) with 6700 tons of explosives which were detonated in the underground chambers and passages. One of the primary objects of this operation was the destruction of the U-hoat per s, elaborate structures of reinforced concrete in the destruction of the U-hoat pers, elaborate structures of reinforced concreto in the inner harboin. This task was completely achieved. Also the labyrinthine tunnels and caves—81 m. in all—which the Gers, used for storage and defence were most adequately shattered; as also were the batteries of heavy guns and the power installations. The physical aspect of the is, was changed a little by the explosion; its S. tip was ilattened and the chiffs, 180 ft. high, were no longer there. Heligoland Bight, Battle of. Heligoland Bight is that area of sea about the is, of Heligoland off the N.W. coast of Germany. The W. end of the Kiel canal enters the mouth of the R. Elbe, which

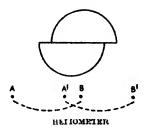

Germany. The W. end of the Kiele canal enters the mouth of the R. Elle, which empties into the Bight. The area was therefore one of great Ger, naval activity during the First World War. Immediately war had been declared, Brit. submarines kept a perpetual watch upon Ger. shipping here, venturing far into the protected area and noting the loutine of protected area and noting the loutine of the various units of the flect. It was therefore arranged to make a sweep of the Bight in the early hours of Aug. 28, 1911, by the light cruser force at Harwich under the command of Commodore Sir Reginald Tyrwhitt. The Bight was de-fended by three lines of warships. Hefore dawn on the appointed day Tyrwhitt's force was approaching its objective, and immediately it was sighted by the Ger-ships they souttled back to the shelter of immediately it was sighted by the Ger. ships they scuttled back to the shelter of Heligoland at top speed, without trying conclusions with their opponents. The day was misty, and this favoured them. The Arethusa and Fenrless distinguished themselves on the Brit. side. One Ger. destroyer which failed to regain Heligoland was sunk. After this first brush the day conjugate the con

This Brit. victory was a severe blow to the Ger. Navy, although it did not come as a surprise to those in authority, who were convinced that their forces could not hold their own against the Brit. They therefore decided not to risk a battle again but

fore decided not to risk a battle again but to reduce the Hrit. fleet by submarine and mino action. (See also Dooger Bank.)
Heliodorus of Emesa in Syria, the earliest of Gk. romance writers. He is known by his Æthiopica, the MS. of which was discovered in 1526 in the library of Matthias Corvinus, and was printed in 1531. It is in ten books, and narrates the stay of the layers. Theserous and Charles. story of the lovers Theagenes and Charle-lea. Consult G. A. Hirschig, Scriptores Frotici, 1856, and an Eng. trans. in Bohn's Classical Library.

Heliogabalus, see ELAGABALUS.
Heliograph, instrument used for sig-ualling swiftly between two distant points, by means of flashing the sun's rays from the face of a mirror. The flashes are made to follow each other in accordare made to follow each other in accordance with a pre-arranged signal code. The mirror, from which a part of the mercury back has been removed, is mounted on a tripod and two sights are provided in front with a screen. The sun ray is then directed through both sights, and the flash can be seen at a distance of many miles, the range of the H. flash de-pending upon the size of the mirror. If the mirror is directed at exactly the required spot, its flashes cannot be read at a distance of more than 10 yds, on either ade if the distance away is 1 m., or for more than 50 yds, at a distance of 2 m.

Heliogravure, see PHOTOGRAVURE. Hellometer, astronomical instrument for measuring the dameters of celestial bodies or their distances from one another, it was invented by Fraunhofer in 1814 and, as its name indicates, was first used

to obtain solar measurements. The H. is an equatorially mounted telescope with its themselves on the Brit. side. One Ger. destroyer which failed to regain Heligoland was sunk. After this first brush the Ger. cruisers began to come out and look for their opponents. The Ger. Manz put up a good fight before she was sunk. She had become detached and could get no support. Adm. Beatty with his battle cruiser squadron now entered the battle, and immediately the Ger. cruisers turned to run to asfety, but they were too late, and the Ariadne was sunk, and a little later the Koin met the same fate. stars formed by one half of the glass, and 1 or 2 ft. high, and the scent of the flower A^1 B, the images formed by the other greatly resembles that of the vanilla; it half. The halves of then glass are separated by a distance AA^1 or BB^1 . If they in Greece, and H. Europæum in S. Europe ated by a distance AA or BB'. If they are now still further separated till A' coincides exactly with B, the distance between the stars is exactly equal to the amount by which the two haives of the class are separated.'

glass are separated.

Heliopolis (the city of the sun): (1) anct. city of Lower Egypt, called in the Bible On. It stood 5 m. E. of the Pelusiac branch of the Nile at the apex of the Delta. It was the chief seat of the Egyptian sunworship, and was famous for its schools of philosophy and astronomy.

The site of the anct. temple is marked by a red granite obelisk. A short distance a red granite obelisk. A short distance from the ruins of the anct. city stands New H. It was founded in 1906 by a Belgian Co. It is in a healthy situation and is well laid out with broad streets and squares. It has churches, mosques, a sporting club and swimming bath, a racing course and club. There is a fine aerodrome. A railway is projected from New H. to Suez. Pop. 23,000. (2) The Gk. name for Baalbek (q.v.).

Helios. Gk. god of the sun known to the

Helios, Gk. god of the sun, known to the Roms. as Sol. Ho was the son of Hyperion and Thea and the brother of Hyperion and Thea and the brother of Selene and Eos. In Honner (Odyssey, viii.) he is described as a god who rises from Oceanus in the E. traverses the heavens, seeing and hearing overything on his way, and descends to Oceanus in the W. Later writers tell of a magnificent palace in the E. from which he comes forth in a flexy charlet described for the logical and of fifty chariot drawn by four horses, and of another palace in the W. His horses grazed on the Is. of the Blessed. The is. of Thrinacia was sacred to him; there his daughters Phætusa and Lampeta tended his flocks. He was worshipped through-out Greece and in the is. of Rhodes, where the mighty Colossus was crected to

Heliostat, see SIDEROSTAT.

Heliotherapy, see SUNLIGHT TREAT-

MENT.
Heliotrope, see BLOODSTONE.

Heliotrope and Turnsole are popular names applied to sev. species of *Heliotropium* (q.n.). The H. plant most commonly cultivated in Britain is *Il Peruvianum*. Winter H. is a common name of Petasites fragrans, a sweet-smelling

species of Composites.

Heliotropism. The direction of the rays of light affects the position of plant members, and it is these phenomena which are termed H. Stems and leaves grow towards the source of light, as may commonly be seen in window plants, and are said to be positively heliotropic, and are said to be positively helictropic, and members, such as roots, which grow away from the light, are said to be negatively helictropic. Young growing parts of plants respond norse quickly to light than older parts.

Helictropium, genus of boraginaceous plants, contains numerous species which inhabit tropical lands and are often cultivated because of their trarent blescome.

vated because of their fragrant blossoms. H. Peruvianum, the Peruvian belietrope,

and the Caucasus.

Heliotype. Process connected with photography and printing. In the development of a negative, the effect of light and shade are obtained by burning away the gelatine in places, and thus causing a relief effect. By using this fact and printing from a suitable form of press, prints can be obtained from the actual gelatine surface, without covering it with timeful as is done in the case of Stanna. tin-foil as is done in the case of Stanna-

Heliozoa, name given to a group of Protozoa commonly called the sunanimalcules. Some have no skeleton, and in some cases they have a gelatinous membrane. Chlamydophora, which have alwars a gelatinous envelope; Chalarothoraca, which have a skeleton of silicious spicules; and Desmothoraca, which have a stalked or unstalked shell with numerous

pores. H. are widely distributed, and are both freshwater and marine.

Helium (from Gk. Mos, the sun), an inactive gaseous element. Lockyer observed in 1868 a bright yellow line in the spectrum of the golar chronosphere close to but not identical in position with D. line of sodium. He ascribed it to a hypothetical element helium. Hillebrand had noticed that an inert gas was evolved when the mineral eleveite was treated with acid. Rambay, repeating these experiments, found that the inert gas refused to combine with oxygen, and on submitting it to Sir William Crookes for spectroscopic examination the spectrum was found to be characterised by a bright yellow line coinciding with the new line discovered by Lockyer in the solar spectrum. The name helium way, therefore, adopted for the new gas. if is abundant in many minerals, all of which contain uranium and barium as important constituents. richest known mineral source is thorianite. which is mainly thorium oxide, and con-tains about 9.5 c.c. per grain. II. is also present in the gases which escape from the water of hot springs and in the atmo-sphere, of which it constitutes four parts in a million. To prepare H from thorian-ite, the mineral is treated with utric acid, when the H. is liberated together with hydrogen, oxides of carbon, and a trace of nitrogen. The hydrogen is removed by nitrogen. The hydrogen is removed by sparking the mixture with oxygen, and the remaining impurities are removed by Dewar's method of absorption with char-coal cooled in liquid air. The H. alone is unabsorbed by the charcoal, and it can the pumped off in a state of perfect purity. The prin. source of H. is the natural gas (mostly consisting of methano) issuing from petroleum wells in certain of the United States and in Canada (Medicine Hat).

Properties.—It is chamically inert. Its density is 1 98, referred to hydrogen as 1. The ratio of its specific heats is 1 66, so that its molecules are monatomic. H. Peruvianum, the Peruvian heliotrope, atomic weight is, therefore, double the turnsole, or charry-pie, is a shrub growing density, i.e. almost 4. Its solubility in water is less than that of any known gas. It approximates more closely to the ideal gas than hydrogen. In 1908 Kamerlingh Onnes of Leyden University succeeded in liquefying it. Its holling point is 4.3° abs., the density of the liquid is ·154, and its critical temp. is 5° abs. Solid H. was obtained by Kelsom in 1928. Its melting-point is only one degree above abs. zero. The a-particle expelled by radium, thorium, uranium, and actinium abs. zero. The a-particle expelled by radium, thorium, uranium, and actinium is identical with the atom of H. This conclusion is based on the following experimental evidence: (1) All a-particles have the same mass and differ only in their velocity of expulsion. This mass has been measured, and has been found to be the same as the mass of the H. atom: (2) The 'emangilon' from radium which (2) The 'emanation' from radium which expels a-particles (radon) was stored in a thin-walled but perfectly gas-tight glass tube, enclosed within a wider vessel. After some days the gas in the outer vessel was found to contain H. It was proved that when H. was stored in the inner tube. none passed through the glass into the outer vessel. In this experiment the velocity of expulsion of the a-particle was o great that the particle could get through thin glass. When it was brought to comparative rest in the space surrounding the thin glass vessel, its properties were identical with those of the atom of H. There is a 1, and well of evidence that one atom of a radio active substance expels but one a-particle at each disintegration. Hence the change from radium to H. may be expressed quantitatively thus:

226 = 222 + 4 Radium = Radon + Helium.

The numbers denote the atomic weights. The atomic number of 11. is 2. Its atom is next to that of hydrogen in simplicity of structure, its nucleus consisting of 4 protons and 2 electrons; the revolving or orbital electrons are thus two

in number. H. had at one time considerable commercial importance as a gas for filling airships. It has not quite so much lifting power as hydrogen, but possesses the in-estimable advantage of being completely non-initammable. For commercial purposes II. is obtained from natural gas that issues from the curth in Kansas and other dists, of the N. Amer. continent (see above). The gas after purification is liquefied as far as is necessary to condense all the constituents except H.; it is then deave off and stored. Millions of cubic drawn off and stored. Millions of cubic feet of II. can thus be obtained per annum at a very reasonable cost.

H. is the lowest member of the group of 'rare,' 'noble' or inactive gales, of which other star members are neon, argon, krypton, xenon and radon.

Heliz, the snail typical genus of Helicides, and contains sev. thousand species; H. hortensis is the common furopeam snail, and H. pomatia, also found in England, is called the Rom.

Eng. rendering of sev. Heb. and Gk. words with distinct connotations. Hence very considerable confusion has arisen. The various words represented thus are the Heb. Sheol, and the Gk. words Hades (\$\delta_{\delta}\text{p}\), Tartarus (\tau\delta_{\delta}\text{p}\), Tartarus (\tau\delta_{\delta}\text{p}\), and Gehenna (\tau\delta_{\delta}\text{p}\). It will be well first to trace slightly the development of the Heb. conception of Sheol, trans. also in the A.V. sometimes as 'grave' and three times as 'pit.' The earlier view is well represented yit.' The earlier view is well represented in passages of the Psalms xxxi. and lxxxvill., from which we see that Shehl is conceived of as a region outside the jurisdiction of Yahweh. and as independent of His existence. Sometimes the dead are here regarded as cognisant of earthly affairs, sometimes as totally ignorant of According to the former of these views, which is also the earlier, the dead retain their self-consciousness, and the retain their sent-consciousness, and the state of affairs in Sheol is a shadowy reproduction of the earthly life. According to the later view, which is fully elucidated in the Book of Job (especially chaps. vii., xiv., and xxvi.), Sheol is equivalent to uter destruction. It is the land of sleep, of utter forgetfulness, and silence. The dead are ignorant of what passes on earth, and are unable to affect its affairs. The ame view 14 put forth in Eccles. ix., where vv. 5 and 10 insist on the fact that all knowledge has forsaken the dead. Considerable development of eschatological conceptions is seen, however, in the post-exilic writings, and the doctrine of the exilic writings, and the doctrine of the resurrection comes into prominence, partly as a result of Persian influence. Two passages, in particular, are of importance as containing a clear enunciation of this doctrine, viz. Isa. xxvl. 1-19, and Dan. xii. By the second century B.C. the general conception of the abodes of the departed had taken a more clearly-defined form, and Gehenna is the name given to the final abode of the wicked, where they suffer endless torments by me, while Sheöl is an intermediate state or both rightcous and wicked, divided mto four parts, two for the wicked, two for the rightcous. The Sadducess, how-ever, still sustained the anct denial of a resurrection. In the N.T., Hades is used by the place of departed spirits. Gehaving tor the place of departed spirits, Gehenna for that of endless (aiwros) punishment for the wicked. Tartarus occurs once (2 l'et. ii. 4) as the abode of the fallen angels. There has been much controversy as to whether the Gk. adjective discretion is equivalent to eternal in the modern sense of the term, that is to say, never ending. The noun aww is frequently used for a long 'period of time,' and from the time of Origen onward, there have been those who held the opinion that ultimately the punishment of the most wicked and even of the devils would have an end, and that thus all would be saved. This is not, however, the common conception of the Early or Medieval Church, for here we find phrases which contain no ambiguity. found in England, is called the Rom.

Snail.

Hell, popularly conceived of as the place in which the finally impenitent of Protestant divines. The pains of H. suffer eternal torment, is in the A.V. the

spiritual, the latter consisting chiefly of the torments of despair and remorse. The difficulties of the doctrine, based as it is on the actual word of Christ, are great and terrific, and have never been felt more keenly than in the modern age. With it the destribe of the translated the designable that the destribution of the content is involved theologically the doctrine of the freedom of the will; only a deliberate and utter rejection of God can separate a soul from Him; therefore no-one can attempt to form an estimate of the fate of others, since apparent wrong-doing may be due to want of deliberation or to ignorance.

Hell, tn. in the prov. of Sor Trondelag, It is situated on the Trondhjem Norway. Flord, 20 m. from Trondheim and on the direct railway from Sundsval to Oslo.

direct railway from Sundsval to Osio.

Hellah, see Hillah.

Hellah, see Hillah.

Hellahicus, or Lesbos (c. 495-411 B.C.),
early Gk. historian, b. at Mitylene in Lesbos. The works attributed to him are:
The Priestess of Hera at Argos; Atthis;
Carneonike, etc., in all about thirty
chronological and historical works. Consult C. W. Müller, Fragmenta historicorum,
1841-72; and J. B. Bury, Incient Greek
Wisdorians, 1909.

Hellas, dist. of S. Thewalv, often identified with Phthiotis. The Gks., who called themselves "Σλληνς (Hellens), after their mythical founder "Ελλην (Hellen), son of Deucalion and Pyrrha, came to use H. to denote all the lands on which they settled, but more particularly the main-land of the Pelopounesus.

Hellbender, see MENOPOME. Hell, Die, valley in the Swartberg (Black Mts.) of Cape Prov., S. Africa inhabited by a farming community of 90 people, descendants of Huguenots who fied from France after the revocation of the edict of Nantes in 1685. The towering rock wall of the Swartberg shuts them off from the world and they have no radio, on from the world and they have no radio, no now-papers, no telephones and because of the lack of roads they are beyond the reach of any wheeled vehicle.

Helle in Gk. myth, the maiden who gave her name to the Hellespont. With

Phrixus, her brother, she fled on the golden-fleeced ram to escape the person-tion of her step-dame, Inc. and fell into the strait, now called the Hellespont, and was

drowned.

drowned.

Hellebore, popular name of species of the ranunculaceous genus Helleborus, found only in Europe. They are sometimes employed in medicine, and when used in moderation they possess stimulating properties; in large doses they act as a fatal poison. H. niridis, the green II., is indigenous to Britain; is herbaceous below, shrubby above, and bears pale green flowers. H. niger, the Christmas rose (q.n.) has white flowers which turn green after tertilisation. A species of Liliacee, Ventum album, is known as the green after tertilisation. A species of Liliacem, Veratrum album, is known as the white H. root.

white H. FOOT.
Hellebore, False, see VERATRUM.
Hellefors, com. and tn. of Sweden in the prov. of Orabro. Pop. 5000.
Hellen, in Gk. legend, was the son of Dencalion and Pyrrha. He ruled over Phthictis and gave to his subjects the mame of Hellenes. His three sons, Æolus,

Helleniam. The term was made popular in England by Matthew Arnold, who used it to denote the principle of classic purity in art, as opposed to Hebraism, which expresses itself as 'romantic' exuberance in art. The word is more correctly applied by Droysen to the phase of rectly applied by Proyen to the phase of Gk. culture prevalent in the second and third centuries among certain Examicrated Alexandria, people, not Gk. by birth, who had adopted the language and customs of anct. Greece. The Hellenistic language is a peculiar form of Gk., with many Heb. and Aramale words and idloms. See P. Wendland, Die hellenistischeromische Kultur in ihren Bezichungen zu Judentum und Christentum, 1907; R. Cohen, La Grèce et l'hellenistion du monde antique, 1939; M. Rostovtrov, The Social and Economic History of the Hellenistic World, 1941. World, 1941.

Hellenist (from the Ok. Adapticer, to imitate the Gks.), a term applied to a person who adopts the manners and customs of anct. Grocce. It was first applied, during the first and second centuries, to the Jows of Alexandria, who laid aside the language and customs of the Hebs, for all the usages of the Gks. See also HELLEN-

Heller, Stephen (1815-88), Austrian musical composer, b. at Pest. At the age of nine he made some sensation as a boy planist. He studied in Paris, and became one of the set of which Chopin, Lizzt, and Hallé were prominent members. He wrote entirely for the planoforte and still retains his popularity with amateur players. H. visited England in 1849 and

players. H. Visited England in 1819 and 1862. See life by H. Barbedette, 1876. Helles, Cape, at the S. end of Gallipoli, near the entrance to the Dardanelles, Here Anzae trops were first landed at the beginning of the Gallipoli campaign in the First World War (see Gallipoli Cam-PAIGN).

Hellespont, see DARDANELLES.

Hell Fire Club, see under MEDMENHAM. Hell Gate, or Hurl Gate, narrows formed by is, in the E. R., New York, U.S.A. near the unction with the Harlem R. and the bend towards Long Island Sound, where at certain states of the tide there is a whirl of currents. John Nowton (1823-95) was the engineer, who, at the instance of the Federal Gov., conducted the blasting operations in 1885, which removed the dangerous rocks and deepened the Channel. H. G. Bridge is a tine now structure which crosses the strait in a single span and has made possible the direct rail service from Boston to Washington, che.

20 m. N.E. of Bayrenth. Pop. 6000.

Helmet, protective covering for the head. At the time of the Norman Conducts a conical 11, with nose-piece was worn with or without safeguards for the ears and nape of the neck. The casque conduct of the great Quaker, William was usually made of strong hide, strong- Penn. H. was delicated in early life and thened with small iron plates. In the elevanth contury a moll-lood was strongthened with small iron plates. In the eleventh century a mail-hood was attached to the casque. A century or so later a beaume of heavy iron was frequently worn over a light basinet. The knights of the fourteenth century wore long pointed visors, that could be moved up and down, while the obels well was work low. while the chain mail was worn low over

ROMAN HELMET

the shoulders. They bore their crest-high on their Hs. The salade or sallet of the next century had a low, rounded crown and a long neck-guard. Other variations of the H. are the armet, burgonet, morion, and cabasset. Firemen of gomet, morion, and cabasset. Firemen of all countries, and the policemen of some, wear Hs. The soldiers of all modern armies are equipped with steel Hs. See J. Hewitt, Ancient Armour and Weapons in Europe, 1860: G. F. A. Laking, Record of European Amour and Arms through Seven Centuries, 1920–22; H. Norris, Costume and Fashion (in course of pub.) pub.).

Helmet-shell, name given to members of the genus Cassis, gasteropod molluses belonging to the family Cassidide, found in tropical seas and the Mediterrancan.
They resemble wholks in appearance,
having thick heavy shells with prominent edges; some species attain considerable size, and, as they are composed of differently coloured layers, they are much used in the manuf. of cameos. C. madagus-carensis is the largest of these, and C. rufa and C. cornula are also commonly used.

Helmholtz, Hermann Ludvig Ferdinand ven (1821-94), Ger. philosopher and man covers the summit. The helm bar is a

became a student by habit; he soon showed mathematical powers. In later years his attention was directed to higher mathematics by force of circumstances. He could not afford a purely scientific career, so he became surgeon in the Prussian army. In 1842 he wrote a thesis, in which he announced the discovery of nerve cells in ganglia; this was his first work, and from 1842 to 1894, the year of his death, scarcely a year passed without work, and roll 1612 to 1634, the year of his death, scarcely a year passed without sev. important papers on scientific subjects from his pen. In 1819 he became prof. of Physiology in Konigsberg; and subsequently in Bonn and Heidelberg. In 1871 he became prof. of Physics in Berlin, and in 1887 nominated head of the Chanterphysic Forthers We proceed. Berlin, and in 1887 noninated head of the Charlottenburg Institute. His pub. works melude Sensations of Tone as a Physiological Basis for the Theory of Music (1873). Set J. C. McKendrick, Helmoltz, 1899. Helmond, tn. of N. Brabant, Netherlands; on the Zuid Willems Canal, 23 m. W. of Venlo. It has manuis. of textiles, etc. Pop. 26,000.

Helmont, Johann Baptist van (1577-1611), Belgian chemist, b. at Brussels; educated at Louvain, where he became prof. of surgery. For some years he devoted himself to the study of mysticism, but was turned to chemistry and natural but was turned to chemistry and natural philosophy by the works of Paracelaus. He spent some years in France, Switzer-land, and England, but in 1009 settled earr Vitvorde and devoted himself to chemical investigations. He made a special study of 'gases,' and estab. the present scientific sense of the word 'gas,' and investigated the chem precised as and investigated the chem, properties of the fluids of the human body. His chief work, Ortus Medicina, was pub. by his son in 1618.

Heimstedt, tn. of Brunswick, Germany. 24 m. S.E. of Brunswick. It is noted for nanufs. of machinery, pottery, woollens, etc., and near it are valuable mineral prings. It grow up in the ninth century round the monastery of St Ludger, and from 1575 to 1809 was famous for its univ. Gounded by Duke Julius. It gained in.

from 1575 to 1809 was famous for its univ. founded by Duke Julius. H. gained importance after the Second World War as the 'frontier' station on the railway line to Berlin, councering the W. and E. zones of occupation. Pop. 17,600.

Helmund, Helmand, or Helmend, riv. of Afghanistan, 11-ing in the Koh-i-Baba chain, S. of the Hindu Kush, and flowing S.W., W. and N.W. into the lake of Hamun, Sectian, or Savaran, near the Persian frontier, after a course of 680 m. Nunerous tribs, ilow into it from S. Afghanistan. In its lower roaches it is wide and deep, but dries up at certain seasons. The water-power is largely used for mills.

Helots (Ch. Liberts or Liberts), serfs of the anot Spartans. The word was de-lived in antiquity from the tin of Helos in Laconia, but is more probably connected with thos, a fen, or with the root of chew, Some scholars suppose them to be of the Achean ruce, but they were more probably the aborigmes of Laconia, who had been enslated by the Athrens before the Forlan conquest. After the second Messenian was the conquered second Messenian was the conquered Messenians were reduced to the status of H, from which Epaminond is liberated them three centuries later after the battle of Leuctra (371 BC). The H were state slaves to the soil and assigned to individual Spartiates to till their holdings I heir masters could neither emancipate thom nor sell them off the lan i, and they were under an oath not to raise the rent payable yearly in kind by the H In time of war they served as light armed troops or as rowers in the fleet — From the Peloponnesian war onwards, they were employed

nesian war onwards, they were employed as heavy infantis, and distinguished bravery was rewarded by consecutation. Helpmakar, to of Klip R dist, Natal, Africa, 80 m N of Pletermaritzburg Formerly a Brit. military post, it had some importance during the Zulu war (1879) and

the Boer war (1900-02). Pon 26,000 Helps, Sir Arthur (1913 7), Engesavist and historian, and cirk to the Privy Council, b at stretham surrey He was the on of a London merchant, and was educated at I'ton and Trinity (ollege, After leaving the univ he Cambridge campringe After leaving the many no was prin the secretary to various public men, and, in 1911, his circumstances rendering him independent of employment, he retired to Bishop's Waltham, and devoted himself for twenty wars to study and writing Appointed in 1860 study and writing Appointed in 1860 Clerk to the Privy Council he became a far unit of Queen Victoria who en trusted him with the task of editing the specific and Addresses of the Pri uc Con-sort (18/2) and her own Leares from the Journal of our Life in the Highlands (1468) The first of his own pubs was I houghts in the Cloister and the Croud (1835) Coeris of aphotisms, and then came I says written in the Intervals of Business (1841). Helvetic Republic, system of gov., consequent upon the occupation of Switzer-land by the Fr. imposed by them in 1798, and abolished to allow of the re-organisation of the old cantonal system by Napoleon in 1803.

Napoleon in 1803.

Helvetii, anct. Celtie nation, which, according to Cassar, inhabited a region roughly corresponding to the W. part of modern Switzerland. Their chief th, was Aventicum. They first appear in hiet, as allies of the Cimbel during their invasion of Italy, but are best known in connection with their invasion of S. Gaul in 58 B.C., when they were repulsed by Casar with great slaughter. They were again defeated by Cavina, a general of Vitellans, after the death of Nero. See E. Howald and E. Meyer, Die 18mische Schweiz. 1940

Helvetius, Claude Adrien (1715-71), Fr philosopher and littrateur, descended from a family of physicians whose original name was Schweitzer (latinised as Helvetius). His grandfather introduced the use of ipecacuanha. His father was first physician to Queen Marie Leczinska of France. Claude Adrien was trained for a financial career, but occupied his spare

time writing verses. At the ago of twenty-three, at the queen's request, he twenty-three, at the queen's request, he was appointed farmer-general, a post of responsibility and dignity, worth 100,000 crowns a year. Thus provided for, he proceeded to enjoy life to the uttermost. As soon as he had saved enough from his receiver as farmer-general he retired to position as farmer-general, he retired to an estate in the country, and employed his large means for the relief of the poor. De l'esprit appeared in 1758, and this both attracted attention and roused formidable opposition for the 'pernicious doctrines' in its philosophy. The author wrote three retractations, yet he had to give up his office at court, and the book was publicly burned by the hangman. Madamedu lefland said that he had written openly what everyone thought secretly. His philosophy belongs to the Utilitarian school. The keynote of his thoughts was that public ethics has a utilitarian basis, and he insisted on the importance of cul-ture in national development. His De time in national development. His De Nomme and Le Bonheur were posthumonsly pub. in 1773. See D. G. Mostratos, Die Fadagopik des Helvetrus, 1891, and study by A. Keim, 1997.

Helwan, tn. of Egypt, near R. Mie, 10 m. S.E. of Cairo, noted on account of its warm sulphur springs. Before the First World War the pop. was about 5000, but since then it has decreased greatly.

Hemidesmus, see SARBAPARILLA

Hemiksem, industrial tn. in Belgium, 6 m. S.S.W. of Antwerp, on the Scheldt. Chief manufs. are copper, lime, and cement. It has brick-works and breweries. Pop. 9200.

Heming (or Hemminge), John (d. 1630), Eng. actor. He is known to have been one of the chief proprietors of the Globe Theatre during the reign of Elizabeth, and Theatre during the reign of Elizabeth, and is connected with Shakespeare in sev. ways. He is said to have created the part of Falstaff, and also played in sev. of Ben Jonson's dramas. With Henry Condell (d. 1627), he was a co-editor of the first folio of Shakespeare, issued in 1023. Hemingtord (or Hemingburgh), Walter (d. 1347), Eng. chronicler. He was subprior of St. Mary's, Gisborough, Yorkshire, and died there. His chronicle extends from 1066 to 1346, and was pubby Gale in his Veteres Scriptores, and by Hearne (Oxford, 1731), and tully ed. in 1848-49 by H. C. Hamilton.

Hemingway, Ernest, b at Oak Park, Illinois, 1898. Educated in the public schools of his native state, he worked as a day-labourer, farm hand, and news-paper reporter. Went to France before America entered the 1914-18 war, as a volunteer in an Amer. ambulance unit. Later enlisted in It. Arditi and was severely wounded. He made his début as author in 1923, and then attracted wide attention with his vol. The Sun Also Rises (1926), this was followed by Men Without Women (1927). It was, however, in 1929 that he definitely estab. his reputation as one of the strongest of the newer genera-tion of Amer. authors by his novel A Farewell to Arms (1929), a story dealing with the adventures and love affair of an with the adventures and to e attain of an Amer, in an ambulance corps serving with the It. army. Since then he has been widely read in America, and, under his influence especially, a whole school of 'tough' novelists has grown up, though none has equalled his best work. Despite his increasing tendency to establish some connection between his stories and political or social conditions, there perpolitical or social conditions, there persists in them a certain suggestion of the love of violence for its own sake, which limits their appeal still further than it has already been limited by the endeavour to sustain indefinitely an interest in simple declarative sentences describing the action of unreflective characters. His For Whom the Bell Tolls (1940) was inspired by his experiences in the Sp. Civil war. Hemiplegia, paralysis of one side of the body. It is the most usual form of paralysis, and affects the leg. the arm, and also

Hempiegia, paralysis of one side of the body. It is the most usual form of paralysis, and affects the leg, the arm, and also the muscles of the mouth and tongue. If the paralysis be on the right side, aphasia (q.v.), often accompanies H. Complete recovery is possible but not very frequent. Slight numbness, and not complete paralysis, of sensation, accompanies H., although if the fibres carrying sensory

impulses to the surface of the brain are destroyed, there may be loss of sensation on the affected side. In certain cases there may be paralysis on the side opposite to the affected limbs. See PARALYSIS. Hemipters, name given to a large order of insects which includes the bugs, planting and insulations and in all of called

lice, scab-insects, etc., and is also called Rhynchota. All individuals belonging to this order are characterised by a mouth consisting of a proboscis or jointed beak, which is concealed by being bent back under the thorax; wings, with rare exceptions, four in number, and the anterior pair more horny than the posterior pair. All H. are sucking insects, and the mouth of the individual, like that of Orthoptera, does not change during its lifetime, but they differ from all other orders of insects they differ from all other orders of insects in respect of the structure of the mouth. The order is divided into Heteroptera, whose wings, partly horny and partly membranous, fold flat on the back; and Homoptera, whose wings cover the body in a rooflike manner. The Anoplura, or Lice, are sometimes included in this group, or may be regarded as a separate order. See B. F. Cummings, The Bed-Bup, 1917; E. A. Butter, Biology of British Hemiptera-Heteroptera, 1923; J. Davidson, List of British Aphidies, 1925; Davidson, List of British Aphides, 1925; W. L. Macatee and J. R. Malloch, Revision of the American Bugs. 1925; J. G. Myers, Insect Singers: Natural History of

Hemling, Hans, see Memling.
Hemlook, name given to sev. plants of different characteristics. Two of these are umbelliferous species and occur in Britain. Cicula rirosa, the water II. or cowbane, is one well-known plant, and Conium maculalum, the common H., is another; both contain a deadly poison. The latter has a mouselike smell, and is well known as the plant from which the poison drunk by Socrates was obtained. The H. spruce is an evergreen coniferous tree found in N. America, and bears the botanical name of Tsuga Cunadensis. It is a valuable plant on account of its bark, which is employed in tanning, the pitch which is employed in tanning, the pitch

Hemmingsen, Niels (1513-1600), Dan. theologian, b. in Laaland; educated under Melanchthon at Wittenberg, becoming prof. of Gk. there in 1543 and of dialectics in 1544. In 1578 he returned to Denmark and became minister of the church of the Holy Ghost at Copenhagen, and professor of Heb. in Copenhagen Univ., which he made famous for its Protestantism. In 1577 he became prof. of divinity there, and in 1579 a canon in the church of Roschild. He assiste of the Bible into Dan. He assisted in the first trans.

Hemorrhage, see HAMORKHAGE, and BLEEDING.

erect stalk, growing from three to sixteen) ft. high according to climate, square in shape, like the common stinging-nettle, five to seven-fingered leaves of lanceolateacuminate form with serrated marging, and is diosclous. The seed is a valuable product, being used as bird-food, and, when crushed, as oil for soap and cilcake.

The H. plant secretes a resinous substance possessing narcotic and intoxicating possessing narcotte and intokrating qualities (see Hashish), while Indian H. or Bhang has proved of value as a hypnotic in therapeuties. It. is, however, most valued for its fibre, which is obtained by burying the stoms in mud and leaving them to rot for seven days, when they are them to rot for seven days, when they are taken out and beaten in the water and all the woody matter is removed, a treatment similar to that of flax (q.v.). The latest (pre-1940) world statistics give a total production of 7.30,000 tons (Philippines or Manila, 230,000; China (probably, 150,000; Russia, 140,000; Italy, 100,000). Manilla Hemp, from the fibre of the long leaves of a species of hannu tree is an leaves of a species of banana tree, is an important industry in the Philippines, about 183,500 tons being produced annually. Sisal II. from the Agare siselana growing wild in Yucatun, Mexico, cultivated in Brit. and Portuguese W. Africa and Dutch W. Indies, is greatly used in the U.S.A. for making ropes and binder twine. Sunn II., or brown H., from the bark of Crotalaria juncea, is not as strong as true H., but resists water botter. New Zealand H. is a growing industry. See also Fiber and Fiber Status, a practical treatise on the culture of Hemp for seed and fiber, 1900; H. it. leaves of a species of banana tree, is an Hemp for seed and fibre, 1900; H. R. Cartor, Modern Flax, Hemp, and Jule Spinning and Twisting, 1925.

H. The modern city, built of black basalt, is mean, dirty, and crowded, and is surrounded by half-ruined walls. The only anct. relies are columns, inscriptions, foundations, and fragments of pavements. There is considerable trade in silk, cotton, oil, gold ware, and sesame. In anct, times, as Emesa, it was famous for its Temple of the Sun, of which Heliofor its Temple of the Sun, of which Heliogabalus, emperor of Rome in 218, was a priest. In 272 the Emperor Aurelian defeated Zenobia here. It was taken by the Saracens in 636, and by the Crusaders in 1098. Ibrahim Pasha defeated the Turks here in 1832. A railway was opened in 1925 from H. to Tripoli, 64 m. Pop. 100,100.

Hemsterhuis, Tiberius (1685-1766), Dutch philologist, b. and educated at Groningon. In 1704 he became prof. of mathematics and philosophy at Amsterdam; in 1720 professor of Gk. at Francker, and in 1740 prof. of Gk. hist, at Leyden.

dam; in 1720 professor of GK. hist. at Leyden. He created a new school of Gk. hist. at Leyden. He created a new school of Gk. philology, which includes among its representatives Ruhnken and Valckenaer. He issued famous eds. of works by Pollux, Lucian, and Aristophanes His son Franz (1721–1790) was a noted philosopher. Hemsworth, vil. of W. Ridling of Yorkshite, England, 64 m. N.E. of Barnsley. Pop. 12,300.

Hemy, Charles Nanier (1841–1017)

Hemy, Charles Napier (1841-1917), Eng.
marine painter, b. at Newcastle-on-Tyne;
son of Henri F. Hemy, distinguished musicial. Educated in art at Newcastle and
Antwerp. He made sev. voyages as a boy,
and at one time joined the Dominicans
at Lyons; but finally settled in England
in 1870, living in London till 1881, when
he removed to Churchfield, Falmouth.
He became a member of the R.W.S. in
1897; A.R.A., 1898; R.A., 1910. His
works include: "Homeward," Oporto,"
'Silent Adleu," Pilchards," Lost (1897),
'smugglers," (1899), "Home Wind,"
Birds of Prey" (1901), 'The Crew"
(1902), 'Youth (1903), 'The Lifeboat'
'Haul Aft," London River," The Crab
Merchant' (1904), 'Bound for London'
(1907), 'Plymouth, Through Sea and
Alr' (1910), 'Home at Last' (1913), 'The
Black Fing' (1913).

Henault, Charles Jean François (1685-1770), Fr. historian. His father was a furner-general of taxes, and a man of hterary tastes. The son was educated at a Jesuit college. In his fifteenth year he a Jesult college. In his litteenth year he entered the Oratory, with the view of becoming a preacher. His literary talent obtained his entrance to the Academy. The literary work upon which he bestowed his chief attention was the Abrige chronologique de l'histoire de France, first pub. in 1744 without the author's name. In the compass of two yels he comprised the ompass of two vols. he comprised the whole hist, of France from the earliest times to the death of Louis XIV. This work was a prodictious success, and was trans, into sev. languages, even into Hampstead, vil. and summer resort of Nassau co., New York, in Hempstead township on the Long Is. R., 20 m. E. of Brooklyn. It was settled by New Englanders in 1643. Pop. 13,000.

Hems, Hums, Homs, or Khoms (Lat. Emesa), city of Syria, near R. Orontes, 63 m. N.E. of Tripoli, cap. of the Sanjak of whitish-yellow flowers which are followed

by an erect capsule dehisting by means of its lid. The H. has an extremely disagreeable odour, hence its name. but in medicine it is sometimes used as a narcotic and sedative.

Henderson, cap. city of Henderson co., Kentucky, U.S.A., on R. Ohio, 10 m. S. of Evansville. The chief industry is the preparation of tobacco. There are coal mines in the dist. Pop. 13,100.

Henderson, Alexander (1583-1646), Scottish ecclesiastic, b. in Criech, Fifeshire. Graduated at st. Andrews in 1603, and in 1610 was appointed prof. of rhetoric and philosophy and questor of the faculty of arts. Shortly after this he was presented to the living of Leuchers. As he was forced upon his par. by Archbishop Gladstanes, and was known to George Gladstanes, and was known to sympathise with cyl-copacy, he cettle-ment was at first unpopular, but he changed his views and became a Presbyterian in doctrine and in church gov., and one of the most esteemed munisters in Scotland. H. is one of the greatest of men in the hist, of Scotland, and next to knox is certainly the most famous Scotdivine. He was once called tish 'Cabinet minister without office.' The existing Preshyterian churches of Scotland are indebted to him for the forms of their dogmas and their eccles, organisation. He

the reformed church of Scotland. Henderson, Arthur (1863-1955), Brit. Labour politician; b. in Glasgow. Educated at St. Mary's School, Glasgow. Served apprenticeship as moulder at Robert Stephenson & Co.'s works at Newcastle-on-Tyne. He became M.P. for Barnard Castle in 1993, and so remained until the general election of 1918. He was chairman of the Parl, Labour Party, 1908-1910; and on the coming of the First World War, when J. Ramsay MacDoneld had to stand uside because of his pacifism, H. was again chosen chairman; and he so remained until 1917. P.C., 1915. He Eng. verses, contained in the Harl. MS. was: President of the Board of Education, 1915-16; Paymester-general and etamzas, rhymeda a b a a b, each of which

is justly considered the second founder of

labour adviser to Gov., 1916; member of war-committee of Cabinet, 1916-17. Gov. emissary to Russia, 1917. He resigned from the Coalition Gov. because of Lloyd George's banning of the Stockholm Labour Conference in the last-mentioned year. Early in 1924, having been returned for Burnley, he joined the first Labour Gov. as Home Secretary. In the Labour Gov. formed June 1929 he became Labour Gov. formed June 1929 he became foreign secretary, in which office he was responsible for the Anglo-Egyptian Treaty (signed after his death, in 1936) under which the Brit. Military occupation was terminated. In 1932 he presided over the Genova disarmament conference, and the Goldva disardiment conterence, and received the Nobel Peace Prize in 1931.

Sec E. A. Jenkins, From Foundry to Forum Office. The Romantic Life of the 1st. Hon. Irthur Henderson, 1933.

Henderson, John (c. 1747–85), Eng. actor, b. in London. He made his début

at Bath in 1772 as Hamlet, and came to be known as 'Bath Roscius.' In 1777 he appeared at the Haymarket, London; in 1778-79 with Sheridan at Drury Lane; and after 1779 at Covent Garden. He was a friend of Mrs. Siddons and Gains-

borough. He was successful in many Shakespearean rôles. Henderson, Sir Neville Meyrick (1882-Henderson, Sir Neville Meyrick (1882–1912), Brit. diplomat, educated at Eton. Attaché in diplomatic service, 1905. Secretary, at successive periods, at St. Petersburg, Tokvo, St. Petersburg (recond time). Rome, Nish and Paris. Counsellor, at Constantinople, 1921, and Acting High Commissioner there, 1922–21. Minister to Egypt, 1921–28; to France, 1929–29; and to Yugosiavia, 1929–35. Ambas. to Argentine and Minister to Paraguay, 1925–37. Ambas. to Germany, 1937 until 1939 (Sept.). It thus fell to his lot to hold the most important diplomatic post in the service at a tant diplomatic post in the service at a time when the brit. Gov.'s appearement policy was in full operation; and when at length, the incasure of Hitler's similar intentions were apparent it was too late. (See on this the article World War, SEGND.—(ARSES.) He wrote Failure of a Mission (1910) and The Water under the Bridges (autobiography, pub. in 1945).

Henderson, Sir William Hannam (1845—1821).

1931), Eng. adm., b. at Worth, Sandwich, June 20. Commanded the Conquest June 20. Commanded the Conquest (1889-92), and served under Sir Edmund Fromantie in the punitive expedition spanst the sultan of Vitu, E. Africa, 1890. Commodere and senior officer in Jamaica during the Cuban War. In 1902 promoted to flag rank and appointed adm.superintendent at Devouport; full adm., superintendent at Devouport; full adm., 1998. He will be remembered as a reformer of naval education, who saw the value of systematic instruction in strategy and tactics. H. derived his appreciation of the importance of this subject from Sir E. B. Hamley, Operation of War (1867), and he received much guouragement in his efforts from Prince Louis of Battenberr. berg.

Hending, Proverbs of, series of Middle Eng. verses, contained in the Harl. MS. 2253 (Brit. Mus.), consisting of six-lined

closes with an old folk proverb, many of which are still in common use. The pro-verbs seem to have been collected from

older thirteenth-century material. Hendon, bor. of Middlesox, England, on R. Brent, 8 m. N.W. of St. Paul's London. A favourite residential suburb of London, and is also a popular holiday resort, the 'Welsh Harp' reservoir of Regent's Canal being much used for skating, fishing, canal being much used for skating, helling, etc. Until recently it was an important aviation centre with aeroplane works and flying schools. Mill Hill, just to the N., has a large Nonconformist Grammar School (1807), and a Rum. Catholic Missionary College (1871). The Mctro-cellton Bales Callege (1871). politan Police College was opened at H. in 1934. Golders Green and Hampstead Garden Suburb are within the bor. Pop. 128,500.

Hendrick, Burton Jesse (1871-1949), Amer. historical writer and hiographer, b. Amer. historical writer and biographer, b. at New Haven, Conn., U.S.A., and educated at Yale. He began as a journalist on the New Evening Post and then joined the staff of McClure's Magazine; from 1913-27 he was an associate editor of The World's Work. His first book was The Age of Big Busines, the title of which perhaps affords an indication of his major interest as a student of Amer. Inst. He was awarded the Pulitzer Prize for his part in The Victory at Sea (1920), written in collabor the world Adm. Win. S. Sims (a.v.). But he will be chiefly remembered in collaboration, with Adm. With Sains Infining industry. 10p. (collab.) 22,500. (q.v.). But he will be chiefly remembered Henie, Frederich Gustav Jakob (1809-in this country, firstly, for his Late and 1885), Ger. pathologist and matemist. b. Letters of Haller H. Pauc. a full and in Franconia. His famous Manual of attractive portrait of a great ambas, and Hallonal Pathology (1846-52), marked a great man; and for his Late of Andrew (use era in pathological study. From Carnogle (1933). The Lite and Letters, which is 1852 to 1873 he was pub. bis great Handattractive portrait of a great ambas, and a great man; and for his Life of Andrew Carnegie (1933). The Life and Letters, which was pub. in 3 vols between 1922–25, is remarkable for the wealth and history cal importance of the material prepared by H. In 1933 was pub. another vol., on The Earlier Lafe and Letters, which fully maintains the interest of its predecessors. The first instalment of his work earned him a Pulitzer Prize for the second time. him a Pulitzer Frize for the Second which For The Training of an American (1928) he received yet a third Pulitzer Prize. His Life of Carnegie, his best piece of biography proper, is an illuminating study both of character and of a tremendous age of industrial expansion. His later books include two on the great issues of the Crvi War: Stalesmen of the Lost Cause (1939) and Lincoln's War Cabinet (1947), showing with shrowd irony opposite sides of the

with shrewd fronty opposite saids of the great struggle,
Hendricks, Thomas Andrews (1819-85),
Amer. political leader, vice-president of U.S.A. in 1885, b. near Zanesville, Ohio. Graduated at Hanover College, Indiana, and in 1843 began a successful career at the Bar. From 1868 till his death he was the forward for nonvinction for the put forward for nomination for the presidency at every democratic convention, save that of 1872. He had been U.S. Senator from Indiana from 1863 to

case of the death of both president and vice-president, the line of succession shall run through the Cabinet in the following order—secretaries of state, treasury, war, attorney-general, secretaries of the navy and interior.

Hengelo, in. of Overlissel, Holland, 5 m. N.W. of Enschede, an industrial centre. There is a large cotton industry, also dyeing, brewing, and railway engineering. Pop. 45.500.

Hengist and Horsa, brother chieftains who led the first saxon bands which extited in England. They were apparently called in by the Brit. king, Vortigern, to defend him sgainst the Picts. The place of their landing is said to be Ebbsfleet in Kent. The settlers of Kent are described by Bede as Jutes, and there are traces in Kentish custom of differences from the other A.-S. kingdoms. II. and II. were at first given the Isle of Thanet as a home, but soon quarrelled with their but, allies, and gradually possessed them-selves of what became the kingdom of Kent. In 455 there was a battle between the two brothers and Vortigern, and Horsa was slain. Thenceforward Hengist reigned in Kent together with his son.

Henin-Lietard, tn. of Pas-de-Calais, France, 7 m. N.W. of Douai, with a coalmining industry. Pop. (comm.) 22,500.

book of Systematic Human Anatomy, Henlein, Konrad (1898–1945), Sudeten-Ger. politician, b. at Maffersdorf, Reichenberg. Was once a bank clerk. Began a Ger. gymnastic movement in Bohemia soon after the Pirst World War. Took a leading part in organising the Sudeten fer. party in Czecho-lovakia and in 1936 he succeeded the extremist trads union leader Kaspar as head of the party. With support from the Nazis in Germany he abandoned the rôle of constitutional he abandoned the role of constitutional lovalist seeking the redress of minority grievances and demanded first autonomy for the Sudctenland and later the com-plete transfer of that ter, to the Ger. Reich. After the anachluss his followers were absorbed into the Nazi party and when Czechoslovakia was occupied by the Gers., H. was appointed chief of the civil administration in the Protectorate. (See CZECHOSLOVARIA.) Later he became Civil Commissioner for Bohemia. He committed suicide in an allied-prisoner-of-war camp cage by slashing his wrists with a razor blade which he had concealed under adhesive tape in his cigarette case (May

10, 1945).
Henley, John (1692-1756).
Henley, b. at Melton Mowbray, educated
henley, b. at Melton Mowbray in Mel-U.S. Senator from Indiana from 1863 to Henley. John (1692-1556). 'Orator 1869 and governor of the state, 1873-77. Henley, 'b. at Meltou Mowbray, educated In 1882 he ran for vice-president when at Cambridge: became a teacher, and Grover Cleveland was his party's presitook holv order, having charges in Meldential nominee and this time was successful. He died shortly after assuming office ton, Sugalk. In 1726 he left the church and this gave rise to the passing by Conandestab. In London his famous 'Oratory.' gress of the law which provides that in Hero he preached primitive Christianity on Sundays, and taught 'universal knowledge 'on Wednesdays, attracting large
numbers by the strangeness of his methods
and doctrines. In 1730 ho became a pensioner of Walpole and editor of the High

and doctrines. In 1/30 to became a penisoner of Walpole and editor of the High Doctor. He wrote Lether in 1714.

Henley, William Ernest (1849-1903), Brit. poet, critic, and editor, b. at Gloucester, and educated at Crypt Grammar School in that city. T. E. Brown, the poet, was headmaster there for some time. His appointment was a stroke of luck for H., to whom his coming meant the lad's first introduction to a man of genius. To the end, H. was no classical scholar, but his knowledge of and love for literature were vital. At the age of twenty-five his health failed, he was sent to a hospital in Edinburgh, and from there he sent in Edinburgh, and from there he sent poems, describing his experience in the ward, to Leslie Stephen, who was editing the Cornhill. The poems were full of poignant force, and Stephen visited his contributor in hospital, in company with Robert Louis Stevenson. The meeting between H. and Stevenson, and the friend-ship which arose between them, form one of the best known episodes in recent literature. In 1877 H. went to London and began his editorial career by editing London. At the end of 1886 he came bethe Scots Observer, and had the knack of discovering literary men. It was that paper which gave to the world Kipling's Barrack-room Ballads (1892) H. excepted by the widness of the scots ercused by his originality an inspiring in-tiuence on the higher class of journalism, but his fame must rest on his poetry. As an editor, with a profound conviction in the soundness of Conservation and imperialism, he often erred about transient tendencies and events; but his trenchant leaders of the early 'nneties on such sub-jects as the development of Socialism, or on India or Burma, show that he was often uncannily and prophetically right H.'s physical sufferings have been said to H.'s physical surerings have been said to be the key to his poetry; there is a feminine note in it and a perverseness in his judgment. He is at his best in fugitive or solitary poems on deeply-emotional themes, such as sunset and a quiet passing like the peetry of John Davidson and John Masefield, the poetry of H is notable for clear out actuality and subordination for clear cut actuality and subordination for clear cut actuality and subordination of beauty for its own sake to the effect of power. He followed Kipling in the swashbuckling vein, and threw himself with a strange zest into the then new fashion of belauding Colonial adventure regardless of Christian traditions. In his iyrios, however, he revealed a genuine if not always original force. His best work is his London Voluntaries (1893), poems unconventional but stimulating and chalunconventional but still matting and charlenging. His collected works were pub. in 1908 and 1921 See L. C. Cornford, William Ernest Henley, 1913, k. V. Lucas, The Colums and their Friends, 1928; K. Williamson, W. E. Henley: a Memoir, 1930; J. Connell, W. E. Henley,

Henns, substance made from the leaves Henna, substance made from one serves of Lawsonia inermis, the Egyptian privet or henna-plant, and is much used in the E for staining nails, finger tips, etc., and by men for dyeing their beards, the colour produced being a roddish orange. Its use has prevailed from very early times. To-day it is used by women for drawing hair. dyeing hair

Hennebont, tn. of Morbihan, France; on R. Blavet, 6 m. N E. of Lorient. Much of the tn. is very old. It is now a busy port, and has boat-building, tunning, and distilling industries. The tn. suffered considerable damage in the Second World

HENRILTTA MARIA

Henrietta Maria (1609-69), Queen of Charles I of England, daughter of Henry IV of France. When the first overtures William Ernest Henley, 1913, E. V. IV of France. When the first overtures tucas, The Colums and their Friends, 1928; K. Williamson, W. E. Henley: a Memotr, 1930; J. Connell, W. E. Henley: a Charles, she was not much more than four-theory teen. Consent was given to the marriage on condition that the Eng. Rom. Catholics Henley-on-Thames, tn. of Oxfordshire, were relieved from the operation of the England, on R. Thames, 36 m. W. of penal laws. She married by proxy and London. A favourite summer resort and had already pledged her husband to a

probably by poison.

Henry, practical unit of electric self-inductance. It was defined by the International (ongress of 1908 as the induction in a circuit when an electro-motive force induced in this circuit is one international ... It, while the inducing current varies at the rate of one unperc per sec.' It derives its name from that of the

discoverer of the proporty of inductance, Joseph Henry (1797–1878).

Henry I. (1068–1135), king of England, the youngest son of Wm. the Conqueror and it is to be noted the only son born to Wm. after he became king. This is of Wm. after he became king. This is of importance, since H. made this fact one of his chief claims to the throne of England of his chief claims to the throne of England against the claim of his cliest brother Robert. During the war between Rufus and Robert of Normandy, H. supported the claims of Robert, but, in the treaty which followed, his claim to the Eng. throne was utterly disregarded. On the death of Rufus, however, and whilst Robert was hastening back from the Holy Lead, he selzed the crown of England (1100), and was elected by the witan. The early part of his right was taken up with struggles with Robert. These struggles ended in a compromise by which Robert was to receive an ann. pension. Robert, however, again went to war and was overwhelmed at Tenchebrai (1105). This battle has been called the Eng. This battle has been called the Eng. revenge for Hastings. Robert remained death in 1133. The struggle in Normandy was continued by Robert's son, who found much support at the hands of the Fr. king. Ultimately, H. was entirely successful. He had done much to commence the amalgamation of Norman and Saxon into a united Eng. race, and although his mar-riage with the Saxon princess, Matilda, was scornfully regarded by the Norman nobles, it was an example which was fol-lowed later by many Normans. In Engnobles, it was an example which was followed later by many Normans. In England itself H. had issued a charter on the part of his reign was spent in France in struggles with the king of France and with Confessor, and had restored law and order his own subjects. He probably regarded

course of action which would bring unpopularity upon him as well as upon herself. The early years of the marriage were unhappy, Charles breaking his promise to relieve the Eng. Catholics. After the assassination of liuckingham, the barrier between the married puir was broken, and the bond of affection that united them never loosened. In 1644 the queen left her husband, to see him no more, being exiled in France on account of religious and political difficulties in England. Her husband's execution in 1649 was a terrible blow to her. When, after he lestoration, she returned to Eugland, See R. W. Church, Saint Anselm, 1870; T. Arnold's ed. of 'Henry of Huntingdon,' Itsioria Anglorum (Rells series), 1879; Conquest (vol. v.), 1867-79; W. Stubbs, The Constitutional History of England (vol. i.), 1894-78; Kate Norgate, England under the Angecia Kings (vol. i.), 1887; The Ramsay, Foundations of England vol. ii.), probably by poison.

Henry II. (q.v.) had ther begins for the forms of Henry II. (q.v.) had their begins of them raining in H. 1119 his only son, ing in It 1119 his only son, in It 1119 his only son, ing in It It 11, ing ing ing 1927.

Henry II. (1133-89), king of England. He was the eldest son of Matilda and deoffrey of Anjou, and was b. in 1133. On the death of his grandfather, Henry I., his mother was passed over in the Eng. succession and Stephen succeeded. Before it, had attained his majority he had proved himself a great warrior, and was the possessor of wide dominions in France. He ruled Normandy, Maine, Anjou, and Touraine, whilst by his marriage to kleanor of Aquitaine, the divorced wife of the king of France, he succeeded to her dower as well. He landed in England in 1153, and by the treaty of Wallingford it was agreed that he should succeed Stephen as king of England. He was crowned in 1154, and immediately began to establish urmly the royal power. The 'nineteen long winters' had left the nobility practually omnipotent in England, and H.'s irst task was to crush the baronial power. This he did by turning the mercenaries out of the country, by demolishing all castles Geoffrey of Anjou, and was b, in 1133. On This he did by turning the mercenaries out of the country, by demolishing all eastles erected without licence, and reverting to the crown all grants of land made during stephen's reign. Having crushed the barons' power, he turneds his attention to the church. The power of the church was admittedly great, but the church was by no means inclined to give up that power. He appointed his chancellor, Becket, archbishop of Canterbury, but Becket proved as obstinate an archbishop as he had been subservient as chancellor. The Constitutions of Clarendon placed the royal and the church courts on an equal basis, but liceket ultimately refused to acknowledge them, and in denance of them appealed to them, and in defiance of them appealed to the pope and fied the country. This utdinately lod, after a pretended recon-ciliation, to his murder (1170). In 1174 H. did public penance at the tomb of Becket.

England as the least important of all his dominions. During his reign, also, attention had been turned to Ireland, where Stronghow had succeeded in establishing Norman power. II. went over to Ireland, reduced the Norman nobility to subjection to himself, and ultimately appointed his youngest son John lord of Ireland. In France, in addition to struggling against France, in addition to struggling against the Fr. king, he had also considerable trouble from hissons, Henry, Richard, and Geoffrey. Both Henry and Geoffrey died before their father, but the final struggle which broke H.'s power was against the king of France and Richard. H. was defeated, humiliated, and forced to agree to terms. He agreed that a general amnesty should be greated to the coholium such as the coholium such as the second to the coholium such as the coholium such as the second to the coholium such as t should be granted to his rebellious subjects. Weak and ill almost to death, he the first name which a list of the rebels; the first name which he saw was that of his best-loved son John, and with the words 'Shaine on a conquered king' he turned his face to the wall and died. His reign in England has been described as a reign of law and order, and certainly the system estab, by H. worked exceedingly well and was of vast un ortance in the building of the constitution of England. He was the greatest of the Plantagenets, and it is to be noticed that in order succossfully to oppose and lessen the power of church and nobility, he enlisted popular support by wise and enlightened measures of reform, and by the Asize of Arms he raised a militia on win h he could always depend. He was an able gen., a wise, if unprincipled, state-man, and a great legislator. See the records of the various chroniclers, such as Wm of Newvatious chroniclers, such as Wm of Newburgh's (or Newburg), Histona Rerum Anglicarum (Hist. of Eng. affairs), Ciraldus Cambrensis (Gorald de Barri) and others (Rolls series); Stubb's Constitutional History; R. Ramsay, Angeron Empire, 1903, F. Hardegen, Imperialpolitik Heinrichs II. ion England, 1905; and the life by L. F. Salzmann, 1905; and the life by L. F. Salamann, 1919.

Henry III. (1207-72), king of England, older son of John. At the age of mine he succeeded to his father's throne, at a period when the struggle for the maintenance of the Charter was at its height. So far had the opposition to his father gone that Louis of France had been invited to accept the allegiance which many of the Eng havens had refused to John. We the Eng. barons had refused to John. By the judicious measures of the regent Pem-broke, of Hubert de Burgh, and Stephen Langton, H. was generally received as king and Louis was compelled to leave the

the papacy, a measure for which his father was responsible for, but of which H. suffered the results. His numerous relations, or the foreign favourites as they were generally termed, were another cause of trouble to H., and caused much ill-feeling throughout the country. His early war with France, which was fought from a mis-taken conception of the ideals of the Eug., ended in disaster, and would have had even more disastrous effects had it not been for the genero-ity of St. Louis. His continued misrule, his attempted extor-tions of money, the vast influence of the papers over the kingdom, and his numerous grants to his favourites, maily united the Eng. as a race against him. Matters came to a head when H. fin illy demanded a huge sum of money to purchase for his son Edmund support to obtain the kingdoin of Sielly granted him by the pope By the Provisions of Oxford his power was relegated to a committee of barons, led by Simon de Montfort, a former favourite and a brother in-law, but now a much-hated rival. In 1263 the Provisions of Oxford were placed under the arbitration of Louis of France, who decided in favour of II., and war numediately broke out The party of Simon de Monifort over the party of Sinton de Montort over whelmed the king at Lewes and for a time the gov. passed into their hands. In 1265 Simon summoned his famous parlia ment, the forerunner of our modern repre sentative parliaments, but in the same year be was overcome and killed at kye sham by Prince Edward. The Montfortian party held power for a time, but finally terms were laid down by the Dickers of Lendworth. However, the of Kenilworth. Hencelorth troubles of the reign ceased, so much so that Edward was able to depart on cru-sade, and it, died peacefully at West-innster. It is important to notice that so minuter. It is important to notice that so thoroughly had affairs been settled that kalward succeeded peacefully to a king-dom to which be did not return until two years after his father's death. Davis, Ingland under the Normans and Angerus. rmana under the Normans and Ingerias, 1905: Sir J. H. Ramsov, Pawn of the Constitution, 1908; Kate Norgato, Minor-ily of Henry 111, 1912: M. Hennings, Ingland under Henry 111, 1924; E. Jacob, Studies in the Period of Baronial Edwar, 1995 Reform, 1925.

Henry IV. (1367-1413), king of England, first of the Plantagenet house of Lancaster to ascend the throne. His accession was in reality the vital cause of the later Wars of the Roses. He was the son of John of Gaunt, the fourth son of Fdward III. He was known in early life as Henry of Bolingbjoke, the title being taken from the place of his birth. He supported Higher II leasting the concepts have and Louis was compelled to leave the country. On the death of Pembroke (1219), Hubert de Burgh ruled for H and adopted a distinctive and national policy. In 1227, however, H. declared lunedly of age. In 1232 be deprived Hubert de Burgh of all his offices, and finally began the period of personal gov. in 1231. His policy was defined at Ravenspur and present of the surrender of the kingdom to own. Finally, he forced Richard, deserted

and betrayed, to abdicate, and was him-self proclaimed king as Henry IV. (1399). 1914-19: R. B. Mowat, Henry V., 1920; He based his claim essentially upon its parl, character. Richard died at Ponte-fract four months later. His reign is char-acteristic chiefly for the lawlessness and rebellion which pervaded it, and for the impetus which his recession to the throne of Prance. He was less than twelve months reactive to the lawlessness and rebellion which pervaded it, and for the impetus which his accession to the throne gave to parliament. The Welsh rebelled under Owen Glendower (Glyndwr); the Scots were attacked, but the attack failed, and reliable the Section (Straight Straight Stra and when the Scott invaded England, they were beaten by the Percies at Homildon Hill (1102). Irritated by the king's be-Hill (1102). Irritated by the king's behaviour, the Precies now rebelled, and attempted to form a junction with the Welsh under Owen Glendower: they were, however, defeated at Shrewsbury (1403). After this the power of the Welsh rebellion began to die out, but Wales can be said to have been practically independent of England's authority during the greater part of this relgn. Prince James of Scotland was captured and kept a prisoner in England, and H. attempted some attacks. England, and H. attempted some attacks in France. His religious policy was strongly in favour of the church, and he commenced a rigorous persecution of the Lollards. Towards the end of his reign he was a chronic invalid and suffered from a particularly painful and, according to some authorities, loathrome disease. He died at Westa 'y ter. He was a capable and clever man, but towards the end of his and elever man, but towards the end of birreign degenerated into a suspicious and cruel tyrant. See J. Gairdner, Houses of Lancaster and York, 1874; J. H. Wylie, History of England under Henry IV.. 1884-98; Sir J. H. Rainsay, Lancaster and York, 1892; C. W. C. Oman, The Political History of England (vol. iv.). 1892; J. H. Flemming, England under the Lancastrians, 1921.

Henry V. (1587-1122), king of England, eldest son of Henry IV., was created Prince of Wales in 1399. His youth was occupied in constant warfare, and many wild and probably exaggerated stories are told of him. That he disagreed with the

the Lancastrum dynasty on his accession. The Percies were restored to favour, Richard's body was interred in West-Hondly, he drove Warwick and unstream hand any attempts at down with a irrn hand any attempts at rebellion. The vear after his accession he claimed the throne of France by right was again king. But Edward IV was forced to fice the country and for a short time H. Warwick and many across to France. Success (1170) the notable battle of Agincourt (1415) and to reduce A. France. Finally came the treaty of Troyes (1420), by which H. married the Fr. king's daughter and was acknowledged as heir to the Fr. throne. Whilst he was in England attending the ceronation of his queen, the Eng. forces met with some reverses. H. thereupon returned to France, but died there in Aug. A just, plous and conscientious ruler, he was without pity, and was a great persecutor of the Lollards. See works cited was demended from that Owen Tudor under Henry IV; also C. L. Kingsford, Henry V.: The Typical Mediaeral Here. the notable buttle of Agincourt (1415) and

France. He was less than twelve months old when he succeeded to the realm of England, and shortly afterwards, by the death of his grandfather Charles VI. of France, he became king of France. His ters. were administered for him by his uncles Bedford and Gloucester. At first the attempt of the Fr. dauphin (Charles VII.) to obtain possession of his father's brone was in vain, but after the appearance of the Maid of France (Jeanne d'Arc), the Eng. becam gradually to lose their Fr. the Eng. began gradually to lose their Fr. 1135 was really the final blow to the Eng. n Eng. hands. In 1447 Gloucoster, after having been arrested by the queen's party, was found dead a few days later. The queen (Margaret of Anjou) now became the real leader of the policy of the court; her husband, plous, learned, and amiable, the translation of the policy of the court. was entirely under her influence, and untortunately events were moving rapidly in England towards a climax. The loss m kngland towards a climax. The loss of the Fr. possessions, the return of the soldiors from France, and the resulting memployment problem which followed, all conspired to make the Lancastrian dynasty unpopular. Nor did the influence of the queen have any better result. In 1454 H. became insone, and Richard, duke of york, a nearer lineal descendant of Edward III. than H., became protector, II. recovered; York was deprived of his office, and it became obvious that of his office, and it became obvious that war was at hand. The year 1455 saw the battle of St. Albans, and from that date until 1471 battles between Yorkists and Lancastrians were frequent. Wakefield (1160) delivered York into the hands of Margaret, by whom he was beheaded, but Towton (1461) placed Edward, earl of March, son of Richard of York, securely on the throne. The power behind the

nected with the royal line, and through his | ably supported by Cardinal Wolsey, but mother was descended from the Beauforts, | it must be remembered that II. was always the descendants of John of Gaunt and Catherine Swinford. He naturally supported the claims of the Lancastrians during the wars of the Roses, and finally put a period to these wars at the battle of Bosworth (1485), where he overthrew Richard III. and was acclaimed king on the battlefield. He was the founder of the Tudor dynasty, and practically estab. a system of absolute monarchy. By his marriage with Elizabeth of York he united the two houses of York and Lancaster, and by his overthrow of Simnel and Warbeck, the pretenders, he finally estab. his line armly on the throne of England. His influence on the Continent was much greater fluence on the Continent was much greater than that of any previous Eng. kiug, and his adoption of a national policy gave England a great position amongst the nations of Europe. The policy of royal marriages which he initiated was of vast importance when judged by its later results. The marriage of his son Henry with Catherine of Aragon, after she had first wedded the elder son Arthur, was a primary cause of the separation from primary cause of the separation from Rome, whilst the marriage of his daughter with James IV. of Scotland led to the ultimate amalgamation of the crowns of England and Scotland. He adopted a policy of peace, he estab, sound com-mercial relations with the Continent, and mercial relations with the Continent, and he realised that whilst the nobility must be crushed, the people must be supported. This peace policy had wide effects upon the later hist, of England. When H. died he left a huge fortune (about £30,000,000) to his son Henry VIII. He was an austere, somewhat misorly king, but nevertheless a king who placed England on a sequence and figure begis than heretonevertheless a king who placed England on a securer and firmer basis than heretofore. See J. R. Lumby (ed.), Francis Bacon's Life of Henry 1 II.; also J. Galrdner, Henry the Secenth. 1889; W. Busch, England under the Tudors (vol. 1, King Henry VII.) (trans.) 1895; A. F. Pollard, The Weign of Henry VII. from contemporary sources, 1913-14; Gladys Tempertey, Henry VII., 1914; W. D. Bushell, The Lady Margaret Beaufort and Henry VII., 1916; C. H. Williams, Henry VII., 1937. 1937.

Henry VIII. (1491-1517), King of England, being the second son of Henry VII. and Elizabeth of York. Until the death of his elder brother Arthur be was educated for the church. He succeeded his father and married Arthur's widow, Catherine of Aragon, in 1509. This marcatherine of Aragon, in 1909. This marriage seems to have caused H. no scruplos at the time. When he succeeded he was one of the most popular kings that England had ever had. He was young, handsome, tall, well built of a jovial disposition, and free and easy with his subjects. No king ever had better prospects when he accorded that throug His retar falls king ever had better prospects when he ascended the throne. His reign falls naturally into two parts, separated by the date 1528, which may be regarded as the critical year of the divorce. The early period was occupied in affairs at home, in promoting the commercial relations of the country, and in maintaining the balance of power in Europe. In all this he was

the leading spirit. The aims of the king, of the cardinal, and of the nation conspired at this time to make the foreign policy popular and national. A life-long policy popular and national. A life-long rivalry had begun between Francis I. of France and Charles V. of Spain. Wolsey profited from their mutual hostility by making England the arbiter between them, and both kings sought the favour of H., Francis at the Field of the (loth of Gold, and Charles in a less ostentatious manner.

HENRY VIII.

in Kent. In 1525, however, Francis was defeated at Pavin. By 1521 II. had grown tired of his wife, he pretended to have scruples as to the legality of the marriage. He had already through Wolsey, incurred the displeasure of parlia-ment by his increasing demands for money, now he heally determined upon the step which was to alienate Rome, to separate the Churches, and in reality, though probably unconsciously, to complete the subjugation of the powers of the country to the crown. Yet previously, from his dislike of Protestantism, he had from his dislike of Protestantism, he had been prepared for peace with Rome, but on his own terms; and his defence of the Papacy against Luther, in 1521, had won him the historic title 'defender of the faith.' By 1528 the matter had advanced to an absolute demand for a divorce. From the point of view of H. there were many reasons for this step. He wanted an hier to the throne—so far Mary alone of his children had surrived: he desired an heir to the throng—so far Mary alone of his children had survived; he desired to marry Anne Boleyn, and he alleged that his marriage had been without the sanction of God. For a time Pope Clement VII. was inclined to concede the demand, and in 1528 Cardinal Campeggio was sent to England, with ample powers. The trial ended without decision, and the crowned the year before his death, and immediate result was the recall of Cambridge and the overthrow of Wolsey. His simply a feudal magnate and regarded immediate result was the recall of Campegio and the overthrow of Wolsey. H.'s failure had, however, only increased the keenness of his desire. Since the papacy would not humour him, he would obtain a divorce in his own courts, and in his own way. In 1531 the recalcitrant clergy were outlawed, and, step by step, and, by means of what is somewhat incorrectly termed the Reformation Parliament, he proceeded until he was acknowledged as head of the church, and the power of the bishop of Rome was declared at an end. But the way had been paved with blood, and Bishop Fisher and Sir Thomas More had paid the penalty of loyalty to principle. It must be definitely understood, however, that H. wished to be strictly orthodox. Illis idea was not the reformation of a religion, but of a religious system; his motives may have been bad, but they motives may have been bad, but they were of vast importance to the nation at large. The Lutherans were far from encouraged, the Whip with Six Thongs (The Six Acts) imposed orthodoxy of the strictest type. The persecutions of Cromwell and the subservience of Granner made the path of H. fairly smooth. The monasteries, the most influential centres of allegiance to the papacy, were abolished (1538-39), those lands configered and of allegiance to the papacy, were about hed (1536-39), their lands confiscated and granted to a new noblity. The pilgrimage of Grace was crushed with metaless severity 9.1 the king became absolutely supreme. H. had, by this time married Anne Boleyn and executed her, by her he had the Princess Elizabeth His next wife, Jane Seymour, here him Prince Edward and died. Anne of Cleves followed: H. was, distributed. followed; If. was displeased with her, and the marriage was immediately disand the marriage was immediately dis-solved; the immediate result was the execution of Cronwell. H. next married Catherine Howard, who was executed for infidelity, and finally Catherine Parr, who nursed him and managed to survive him. During the latter part of the reign the Reformed religion had made some progress with little or ne encouragement. progress with little or no encouragement from H. The later years of the reign were, however, marked by cruelties and bloodshed beyond measure, and H. died finally with the reputation of a bloody finally with the reputation of a bloody tyrant. The facts of Henry VIII.'s life are to be found in the Letters and Papers of the Reign of Henry VIII. 21 vols. ed. by S. J. Brower and J. Gaitdner. 1910. See also J. Froude. only as primus interpares.

Henry II. (1519-59), King of France, in 1533 married Catherine de' Medici. He succeeded his father, Francis I. The influence of the family of Guise led to the interference of France in Scotland, and to have with England. This was registed to war with England. This war resulted in the capture of Calais, which had for over two centuries been in the possession of England. This reign witnessed much

HENRY III. OF FRANCL

oppression of the Protestants, but nevertheless H. supported the reformers against the emperor with some degree of success, the emperor with some degree of success, but was overthrown in the Sp. Netherlands by Alva. The treaty of Cateau-Cambrésis concluded the war with the empire and Spain. He was slain at a tournament by a Scottish nobleman. See I. de la Barre-Dupatre, Histoire de Henri II., 1887; L. Romier, Les Origines politiques des guerres de réligion, 1913-14, and Le Royaume de Cutherre de Médicis, 1929 1922

Henry III. (1551-89). King of France, the last of the Valois, was the third son of Henry II. and Catherine de' Mcdici. He fought against the Protestants at Jamao and Moncontour. He played a great part in the massacre of St. Bartholomew, and after being elected king of Poland, succeeded to the Fr. throne on the death of his brother Charles IX. (1574). (ed.), The Lore Letters of Henry VIII., death of his brother Charles IX. (1574). Buring his reign almost constant wars took place between the Catholics and the Protection 1031, son of King Robert and grandson of Hugh Capet. The early years of his reign were spent in lighting the fendal nobles, who supported the claims of his was at times violently anti-Protestant. He was assasinated on Aug. I by a friar younger brother Robert. When this dispute was settled he turned his attention to Normany, where he attacked Wm. the Bestard without success. His son was

Froer, Henry III., 1858; P. Robiquet, Paris et la Lique sous Henri III., 1887. Henry IV. (1853-1610), king of France and Navarre, b. in the castle of Pau, the son of Antoine de Bourbon, and Jeanne son of Antoine de Bouron, and Jeanne D'Albret, the heiress of Navarre. He was educated as a Calvinist, and after 1569 was recognised as the Huguenot leader of France. He fought at Jarnac, and led the Protestants in the religious wars which were rife in France at this time. In 1572 he married Margaret de Valois, the sister of the king of France, but within a week followed the massacre of St. Bartholomew, after which Hermajned mactically a street which Hermajned mactically a after which H. remained practically a prisoner in the hands of the Fr. court. He finally renounced his religion and later escaped to Alencon, where he repudiated that renunciation and again put himself at the head of the Protestants. Henry III. depended upon him for support, and on the death of that monarch, II, of Navarro the death of that monarch, 11, of Navarro became nominally the king of France. His Protestantism made him repugnant to the majority of his subjects, and the Catholic League, strengthened by support from outside, especially from Spain, was strong enough to force him to the S. There he remained for some time until his renunciation of Protestantism and his entrance into the Catholic Church entrance into entrance into the Catholic Church secured for him the allegiance of the vast majority of his subjects. The peace of Vervins ended the war with Spain, and II. was at last free to turn to the internal aftairs of the country. He, together with his minister, Sully, referred the finances of the country, centralised the gov.. and above all reduced the power of the nobles. Commerce and trade received a great impetus, and the national debt was largely reduced. Just after the coronation of the second queen, and while he was on the point of setting out to war in Germany, he was assassinated by a religious fauntic. Ho was essentially a patriot king, and worked throughout for the good of his country. Paris, he said, was worth a worked throughout for the good of macountry. 'Paris,' he said. 'was worth a Mass.' He had many mistresses, and his immoral life was the worst side of his character. See besides the hists, of France, the Momoirs of Sully and others; calso M. W. Ercer, Henry 11, 1858; E. Henry V. of France, see Chambord, Comte de.

Henry II. (1333-70), king of Castile, surnamed 'El Bastardo,' was an illegitimate son of King Alphonso the Avenger. He led repeated rebellions against l'edro the Crael, and was supported by the Fr. the Creet, and was supported by the Fr. leader Bertrand du Gueselin. In spite of the opposition of the Eng. under the Black Prince, he was able to establish himself in 1869. He then led an army against Portugal. His reign was conducted more on lines of defence then agressiveness.

Henry III. (1379-1406), king of Castile, surnamed 'The Sickly.' It's succeeded his father at the age of eleven, and the period of the regency was somewhat disturbed. He was able, however, to assort his power, and under his personal rule the kingdom prospered. He married in 1393 Catherine of Lancaster. During his reign the Canary 1s. were taken possession of by Castile.

Henry I. (876-936), surnamed the Fowler, king, but not emperor, of Germany, the son of Otto, duke of Saxony, succeeded (919) to these dominions on the death of his father. He was strong enough to resist the attacks of the emperor, and to reser the attacks of the emperor, and built up in Germany a strong and con-solidated state, which contained Lorraine, and which held Hungary in check. He instituted now methods of attack in war-fare, and built large cities throughout Saxony and Thuringia. He was on the point of claiming the imperial throne when he died. The value of his work towardthe building up of Germany was very great indeed. See R. Hollzmann, Ge-schn'ite der sechsischen Kaiser-eit, 1941.

Henry II. (973-1021), Ger. emperor, the son of the duke of Bayaria and the grand-son of Henry the Fowler. He was of considerable service to the Emperor, Otto III., whom, as the last representative of the saxon house, he succeeded in 1992. He had many revolts to contend against, but he secured Lombardy to himself, defeated the Poles, obtained the promise of the incorporation of Burgundy with the empire, drove back the GRs, in Italy with the help of the Normans, and greatly in-creased the power of the church. This latter side of his policy was of vast im-portance, since he raised up the power of the church in order to balance the power of the nobility. He was one of the greatest patrons which the church has ever had, and was canonised after his death. See hie by H. Gunser, 1901, and R. Holtzmann, Geschichte der suchsischen Kuiserzeit, 1941.

Henry III. (1017-56), Gcr. emperor, son son of Conrad II. He was successively king of the Gers., duke of Bayaria, and duke of Swabia, and finally became om-pero in 1939. He restored and kept up the peropative of the empire, and en-couraged the movement towards the reform of the courch. He deposed the three ival popes, and placed Clement II, on the papal throne. He forced the duke of Bohemia to acknowledge himself a vassal of the empire, and practically placed Hungary under the allegiance of the emperors. He encouraged art, archi-tecture, and learning. One of his greatest achievements was the estab, of supremacy over the Normans in Italy. See monographs by E. Steindorff, 1874-81 and P. Kehr, 1930.

Henry IV. (1050-1106) Ger. emperor, son of Henry III., and succeeded his father at the age of sig. His mother, the Empress Agnes, at list acted as regent, but her rule was too week, and at the age of twolve the emperor fell into the hands of Anno, archibishop of Koin, by whom he was educated. The position of Auno was

over H. The constant changing of his tutors, and the weakness of his training due to the constant rivalry of his regents, led to excesses on the part of the young emperor. He was not, however, without ability. He was declared of ago in 1065, but his troubles began with the rebellion but his troubles began with the recollion of Otto duke of Havaria, whom he was able finally to crush. The princes of the empire, however, gave him little or no support. The next great trouble of the reign was the quarrel with the papacy. known as the investiture dispute. The papacy under Gregory VII. (Hildebrand) was endeavouring to raise the moral tone of the clercy by securing the abolition of law investiture, is the amointment of the lay investiture i.e. the appointment of the higher elergy by the civil authority. Though previous emperors had supported the papal claims, II. now entered the lists as the champion of the civil power. His first step was to demand that Gregory should excommunicate his enemies. reply the pope insisted on H. considering various charges brought against him by his subjects. H. called a council of prelates and announced Gregory deposed. Gregory issued sentence of excommunication against H. H.'s supporters quickly fell away, and he saw that his only hope of success lay in surrender to the papacy. He sought out the pope at (anosat, and there, after willing for three days in the shirt of a penitent, amidst the snows of the Aponumes, he was admitted to the prosence and forgiven. The princes of the empire were still dissatisfied. Three the empire were still disastisted. Three anti-emperors were raised up in succession, and although H. won some successes, even his sons were induced to rebel against their father. The papacy also still continued its policy of opposition to the emperor, and although H. was successful in maintaining a pope of his own choice in Hone, he was forced finally to abdicate, and he fled from prison to Liège. Here head of the Welf family. He was necessful in the head of Saxony and Bavoria, His beauting another attack on the Carlon of them by Predictive Barbaross. He encouraged he was restored to some of them by Predictive Barbaross. He encouraged he was restored to some of them by Predictive and the pope when he died. In ports on the Battic, and founded the prover become in termany that a league power become in termany that a league king, H. was in reality, nothing of the kind. His work was of vast importance. He of princes was formed against him, but realised that the power of the papacy had this had so little effect that he was finally increased, and must, for the safety of the placed under the ban of the empire (1180), empire, be diminished, and he cought also the was reconciled, however, to the Emto crush the power of the secular nobles peror Henry VI. He was the last of the Franconian dynasty. See monographs by F. W. Glesebrecht, 1890, and H. Benniza, 1927.

Henry VI. (1165-97), Ger. emperor, was the son of the Emperor Frederick Bar-barosa. He was made king of Germany during his early childhood (1169), and succeeded to the empire (1190) on the death of his father whilst leading the cruical death of his father whilst leading the his father whilst leadin the power of his dynasty. He crushed the rebellions in Sigily, and overawed the whole empire. He even for a time forced the emperor of the E. empire to do him homage. His Sicilian campaigns form the object of greatest interest in his reign, and he was able to raise a tine army from the he was able to raise a tine army from the ranson which he obtained from Richard I. of England. His attempts to establish his dynasty on the imperial throne falled principally because of his early death. Set 11. Torche. Jahrbitcher, 1867; J. Haller, Heinruch IV. und die römtsche Kurn., 1914; E. Perels, Erbreichsplan Hunrichs VI., 1927.

Henry VII. (c. 1275-1313), Ger. emperor, was the son of Henry II., count of Luxemburg. Ho owed his election as emperor at Home in 1312 to the fact that there was no strong opposition, and that he was regarded as being unimportant. He engarded

garded as being unimportant. He en-riched his own family with the lands of Bohemia, and attempted to revive the old glories of the empire. He, however, made the error of supporting the princes against the growing power of the cities. Nee lives by K. Gräfe, 1911 and F. Schneider,

up ports on the Baltic, and founded the ta. of Munich, So great, however, did his power become in Germany that a league He was reconciled, however, to the Emperor Henry VI. See lives by A. L. Poole, 1912; M. Philippson, 1867, 1918; P. Bartels, 1923, and C. Hampo, Herischerustalin, 1927.

Henry the Navigator (1394-1460), fourth son of King Jose 1, of Portugal and Henry V. (1081-25), Ger. emperor, was the Eng. princess, Philippa, daughter of the second son of lionry IV. His elder John of Gaunt. He carly distinctished brother. Conrad, was deprived of his himself by his bravery, but he is best rights of succession because of his rebellion fromembered for the services which he

and thereafter James drifted rapidly away from France and became a close ally

of Spain.

Henry, Sir Edward (1850-1931), Brit. commissioner of police and criminologist. Studied for the Indian Civil Service and joined the N.W. Prov. Service. In 1891 ho was appointed Inspector-Gen. of Police, and thus began the work in which he won distinction. His name will always be associated with the perfecting of the to associated with the perfecting of the inger print wasten of identifying criminals, which system he learned in India. In 1901 H. was appointed Assistant-Com-missioner of Police in London, and in 1903 Commissioner, besides being head of the Criminal Investigation Department, holding these offices till 1918. To him more than any other man is due the efficiency of the modern C.I.D. He did much, too, to improve the status of the police, and inaugurated the Peel Training School,

inaugurated the Peel Training School, besides supporting the Police Orphanage, Henry Frederick, Prince of Wales, (1591-1612), eldest son of James I. He was hat Stirling Castle some years before the accession of his father to the throne of England. On his birth he was created duke of Rothesay, and in 1610 Prince of Wales. He died at the age of cighteen, when his career had already given great promise.

promise.

Henry, Joseph (1797-1878), Amer. scientist, b. in Albany, New York. He appears to have been the first to adopt insulated wire for the magnetic coil. He was the first to magnetise iron at a distance, and he was also the first to apply the telegraph to meteorological research. The unit, of electrical induction is named after him. From 1868 he was chosen annually as president of the National Academy of Sciences, and he was also president of the Philosophical Society of Washington from the date of its organisa-Washington from the date of its organisa-tion in 1871. He wrote Conditionions Electricity (1839) and Syllabus of Lectures in Physics (1844).

Henry, Matthew (1662–1711). Eng. Nonconformed divine, b. on the borders of

Flintshire and Shropshire, son of Philip H., who was ejected by the Act of Uniformity; he possessed private means, and educated his son well. The ton relinquished legal studies for theology, and in 1687 he became minister of a Presbyterian church at Chester. His well-known exposition of the O.T. and N.T. (1710) is a commentary of a practical and devotional rather than critical kind. Its racy Eng. style secured for it the foremost place among works of its kind.

Henry, O. (1862-1910), Amer. short-story writer, b. at Greensboro, N. ('arc-dins, U.S.A. After a brief schooling, ho worked in a drug store in his native tn. until ill-health compelled him to try life on a ranch in Texas. In 1884 he secured

The Golden Age of Prince Henry the Navigator, 1891 (trans. 1914).

Henry, Prince of Wales, eldest son of James I, of England by his wife, Anne of Jennark. He was a prince of great promise, who was the hope of those who disliked Spain. Unhappily he died in 1895 the young man, whose real name 1612 soon after the death of Robert Cecil, and thereafter James drifted rapidly the Navy death him a flysiking blook provides to the Houston Texas Post. Fate seemed to have death him a flysiking blook provides to have dealt him a finishing blow when, in 1896, he was arrested on the charge of embezzling some of the funds of the Austin bank. The episode was nover entirely cleared up. What is known is that in 1898 Porter was sentenced to flye years' imprisonment in the Ohio Penitentiary. This was reduced to three years by good behaviour. Within prison walls, now for the first time he began to settle down to the scious business of writing, drawing upon his knowledge of the queer people he had met in the S.W. His MSS, were sent out under the nom-de-plume of O. Henry. His first but stroke of luck came when the New 1 ork World gave him a contract to supply one short story per week, at a fee of 100 dollars each. It was only some years later that the general reading public learned that O. Henry was Porter, the man who had been in prison. Despite his rather intemperate habits, he pespite ma rather intemperate habits, he was a prodigious worker, and vol. after vol. of his short stories was issued, among them being Cabbages and Kings (1904). The Four Million (1905). The Heart of the West (1907). The Lowe of the City (1908). Many of his stories are marked by their humour, others by their tenderness for the lowly and the unfortunate. And all of the was a secretary of the contraction of th of them are notable for the surprising unexpectedness of their cadings. His kind of short story resembles that of his pre-decessors Mark Twain, Bret Harte, and Ambrose Pierce and after him in the same Annoose Fisher and are find the same tradition followed ling Lardner and Dannon Runyon. Ins collected works were pub. in 1917. See R. H. Davis and A. B. Maurice, The Caliph of Bagdad—Arabian Nights Flashes of the Life, Latters,

and Work of O. Henry, 1931; and life by W. W. Williams, 1936.

Henry, Patrick (1736-99), Amer. statesman and orator, b, at Studley in Virginia; the son of a well-educated Scotsman, his mother being of Welsh descent. A lawyer he was brilliantly successful. 1765 he became a member of the Virginian House of Burgesses, and led the political agitation which caused the revolution. Beclared Stamp Act illegal, 1765; a member of the Continental Congress, 1774; Virginia Convention, 1775; Ratifying Convention, 1785; Governor of Virginia, 1776-79 and 1784-86. Known as the greatest speaker of his generation, perhaps his fluest certion was that rade perhaps his finest cration was that made in 1765, when the Virginian legislature was protesting against the obnoxious Stamp Act foisted on the Amer. Colonies by King George III, and his Cabinet. H. declared that the people of the Colony had all the rights of natural-born subjects of England and were bound to obey no laws except those of their own making. Then he continued in a famous passage: *Cæsar had his Brutus, Charles I. his

Henson, Herbert Hensley (1863-1947), Fing bishop, b in London, fourth son of Phos. H, of Broadstairs. Lducated privately, and at Oxford Univ., where he was a fellow of All Souls' College from 1884 to 1891—re-elected 1896. He was head of Oxford House, Bethnal Green, 1887-88 vicar of Barking, kssex, 1888-99, in number of St. Mary's Hospital, Hford, 1891-1900; chaplain to the Bishop of St. Albans, 1897-1900, rector of St. Margurts, Westminster, and a canon of the Abbey, 1900-12 (sub dean, 1911-12), dean of Durham, 1912-18 He was proctor in Convocation in 1903 If a forcible and arresting method of stating his views changed little throughout his ministry, the News themselves changed and Name (Dresdons of Brahms, (1907), and Musings and Memories (his own reminis cances, 1918)

Henselt, Adolf von (1814–89), Gor musical composer, b. at Schwabach,

At Illord, though still defluitely a high churchman, he reduced the caro-monial he found. At St. Margaret's he be-came a broad churchman and a defen-der of Modernism. In 1907 he regarded Anglo-Catholicism as a spent force. He proposed to preach in a Birmingham Nonconformist chanel, in spite of the veto of the bishop, Dr. Gore. At this period he was an ardent champion of the Establishment, yet almost every sermon he preached in his later years included an eloquent demand for Disestablishment. His appointment in 1918 to the bishoprio of Hereford was strongly resented by the non-Protestant section of the church. had not only preached in nonconformist places of worship, but had in his writings commended a latitudinarian interpretation of Christian doctrine most unusual in an Anglican clorgyman: e.g. 'We want expurgated Bibles' (The Value of the Bible); and 'No doubt there is much in the primitive accounts of the Resurrection Bible); and 'No doubt there is much in the primitive accounts of the Resurrection which is demonstrably unhistorical' (ibid.). He was bishop of Durham from 1920 to 1939; Canon of Westminster Abbey, 1910-41. Gifford Lecturer, 1935. His pubs. include: Light and Leaven (1897), Apostolic Christianity (1898), Ad Rem, Thoughts on the Crisis in the Church (1900), English Religion in the 17th Century (1903), Religion in the Schools (1908), Christian Murriage (1907), Christ and the Nation (1908), Westminster Sermons (1910), Puritanism in England (1912), War-Time Sermons (1915), ('hristian Liberty (1918), Anglicanism (1921), In Defeace of the English Church (1923), Byron (Redo Lecture 1924), Notes on Spiritual Healing (1925), The Book and the Vote (1928), Disestablishment (1929), The Oxford Groups (1933), ('hristian Morality (1936), Ad Clerum (1937), The Church of England (1939), Last il ords in Westminster Abbey (1941), Reimpsect of an Unimportant Life (2 vols, 1912-13).

Henty, George Alfred (1832-1902), Enganthor, b. at Trumpington near Cambridge. But left without taking a degree. On the outbreak of the Crimean War he volunteered for active service, and his letters describing the siege of Sebustopol were pub. in

for active service, and his letters describing the siege of Sebastopol were pub. in the Morning Alvertiser. In 1365 he adopted the calling of a fournalet, and wrote for the Standard, going mon many famous expeditions. His first boy's book appeared in 1568, Out in the Pampas, and was followed by The Young France-Triers, a tale of the France-Prissian War (1872). He also tried his hand at novel writing, but without success, his great forte being tides of adventure for boys, of which he wrote about eighty.

Henzada, the of Burma, cape of the Helist. It is 66 m. W.N.W. of Pegu on the Irawaddy H. at the apex of the delta proper. Thus it forms a trade centre for the people of the delta and those of the for active service, and his letters describ-

proper. Thurst torms a trade centre for the people of the delta and those of the Lower Irawaddy Valley. It is here that the Rangoon line to Bassein crosses the frawaddy by rallway ferry. The dist. has an area of 28% eq. m. and a pop. of 550,860. Pop. (tn.) 23,600.

Hepatica, sometimes considered to be a Mepanoa, sometimes considered to us a separate goins of ranuaciacous plants, is more usually included in the genus Anemone. The species are herbs and sev. occur in Britain. A. Hepatica, the common H., has a donse involucre of green bracts which resemble a calyx, and the blue flowers are visited by bees for the honey they secrete. the honey they secrete.

Hephæstion ('Πφαιστιωι'), companion and friend of Alexander the Great, was the sour of Amyntor. He appears to have served with distinction at the hattic of Arbela, and was one of the veven select officers who were in close attendance upon the king's person. He was also com-mander of the horse guards (craîpo) for a time, and was entrusted with many importent commands during the campaigns in Bactra, etc., and the expedition to India.

He d. of a fever in 325 at Echatana. Hephæstus (Høneres), in Gk. mythology, the god of fire and of the arts which need the in their execution (equivalent to the Roman Vulcan). According to Homer he was the son of Zeus and Hera, and being a weakling from birth, was despised by his mother, who dropped him from Olympus into the sea. But he was rescued by Thotis and Eurynome, with whom he dwelt for nine years, busying himself by making a variety of ornaments, and amonest them the golden chair which he sent to his mother by way of revence. Having been brought back to Olympus by Dionysus, he was a second time hurled from the int., and this time by Zeus for championing his mother's cause. He settled for a time in Lemnos, but finally returned to Olympus and acted as mediator between his parents. All the masterpieces of metal which appear in the stories of gods and heroes, the legis of Zeus, the arms of Achilles, the sceptre of Agamemnon, the necklace of Harmonia, etc., were attributed to H., and his work-shops were placed on Mt. Olympus, and in various volcanie i-les where he received the help of the Cyclopes

Heppenheim, tn. in Hessen, Germany, 13 m. E. of Worms, is a health resort. It

13 m. E. of Worms, is a health resort. It dates from the time of the Roms, and contains the runs of Starkenburg Castle (1964), a former stronghold of the archbishops of Mainz. It has quarries, and manufactobacco and machinery. Pop. 8800, Hepplewhite, Georgie (J. 1786), Eng. furniture designer, who had a business in London at St. Giles, Cripplegate. His furniture in malogaby and satin-wood achieved a wide renown, especially his chairs which are made with a shield or heart-shaped back. His Cabinet-Maker

and Upholsterer's Guide was pub. in 1788. See K. W. Clouston, The Chippendole Period in English Furniture, 1897; R. Edwards, Heppleuchite Furniture Designs,

1948.

Heptane, name given to hydrocarbons of the paratiti series, consisting of 7 carbon atoms, chem. formula, C,H_{1s}. The two chief are (1) normal H., boiling point, 98-3, sp. gr. at 20° 0-683, contained in petroleum and in the tar-oil from cannel coal. Along with octane, it forms the chief part of the commercial petroleum ether. It is colourloss and has a faint agreeable odour. It recurs in the nut in the first of the commercial petroleum which a resin is obtained which, distilled with sulphurle acid, yields pure hydrocarlom. (n) methylethylpropylmothane—the simplest paratin with an asymmetric carbon atom, formed by the action of zine cthyl on acctone chieful.

Hepterchy (from Gk. arra, seven, and dρχη, kingdom), name given to the seven kingdoms, Kent, E. Anglia, Sus-ex. Wossex, Northumbria, Mercia, and Essex, comprising Saxon Fugland. They were comprising Saxon Figland. They were not contemporaneously distinct and inde-pendent kingdoms, but at some time between the fifth and minth centuries they each had a separate existence. At the beginning of the unth century, Wessex, under King Eghert, became the strongest, and absorbed the other kingdoms.

pomogranate, the symbol of wedded love and fruitfulness.

pomogranate, the symbol of wedded love and fruitfulness.

Heracleia Lyncastis, see MONASTIR.

Heracleia, name given to a number of anct. (ik. tns.: (i) An anct. place of Pisatis in Ells, distant about 45 stadis from Olympia, noted for its medicinal waters. (2) A city of Magna Gracia, lectween the rivs. Aciris and Siris, on the gulf of Tarentum. It was probably founded about 432 B.C., and was first estab on the anct. site of Siris. It rapidly nose to prosperity, and was selected as the place of needing of the General Assembly of the Italiot Gks. During the war of Pyrchus with the Roms., the consultavinus was defeated in 280 B.C. near this city. It, was still a flourishing and important to. in Cicero's time, and was in existence much later still. but is now extined. The 'Tabulae Heracleenses,' bronze tablets containing the letacleenses,' bronze tablets containing the letacleenses,' bronze tablets, were discovered on this site. (3) II. Minon, on the S. coast of Sicily, at the mouth of the R. Halyeus, between Agrigentum and Sellinus. It appears to have been a colony of Schinus, at first bearing the name of Minoa, but was exteed by Euryleon. a Spartan, who gave it the name of H. It was occupied by the Carthaginan gen., Hauno, in 280 B.C., and in 250 was the scene of the defeat of the Punic fleet, and appears to have been on the prin. naval stadions of the Carunder King Egbert, became the strongest, and absorbed the other kingdoms. Heptat act would like with a seven and new conditions of the Bible, is formed on the analogy of Pentateuch. It is specially used to designate an A.-S. trans, of these books and the book of Job. made in the tenth century, copies of which are in the Bitl. Museum and the Bodielan Library. Heptoic Acids, acids belonging to the tenth century, copies of which are in the Brit. Museum and the Bodielan Library. Heptoic Acids, acids belonging to the fatty series, having seven carbon atous (C.H., O.). The only important one is the normal heptoic acid, or occanthol or normal heptoic acid, or occanthol or normal heptoid results and finite of Leus. Equivalent of ill. under reduced pressure and fraction ating the product.

Hera, in Gk. mythology the queen of Heaven, daughter of Cronus and Rheat and sinks the mother of Hephanical and Rheat and sinks the foliage of the Rom. Jano. She shared the power of heaven, daughter of Cronus and Rheat and sinks the foliage of the Rom. Jano. She shared the power of the form about 34 R.C., when it was partly destroyed by Aurelius Cottan and sinks the foliage of the first personal and the first personal and the foliage of the first personal and the foliage of the first personal and the first personal and the first personal and the first personal and the foliage of the first personal and the f

over his native city. He appears to have travelled in his youth, and on his return to Ephesus was offered the chief magistracy, which, however, he refused, likewise declining an invitation of Darius to visit his court, in order that he might live in retirement. His later years were devoted to his great philosophical work On Nature, in which he asserts that everything is in a state of eternal flux (Harkhetrog филко магта реі), so that nothing can escape final destruction, not even the can escape final destruction, not even the gods, and that the ultimate principle into which all existence is resolvable is fire. gods, and that the ultimate principle into which all existence is resolvable is fire. That fire changes continually to water, and then into earth, and that the earth changes back again to water, and the volved by a natural operation from fire which is also the luman life and soul, and therefore rational, an intelligence which guides the whole universe. Spengler derived from H. the idea of change as continuous and rhythmic, as never-ceasing yet exhibiting a definite pattern. It was not, however, the assertion of the reality of change which led Justin Martyr to speak of H. as a Christian before Christ. It was rather the discovery of rhythm or pattern in the process of change that appealed. H., having introduced into Gk. philosophy the term logos, (with which the Fourth Gospel opens), Justin Martyr confidently asserts. 'They who have lived in company with the Logos were Christians, even if they were accounted atheists; and such, among the Gks. were Socrates and Herneleitos.' See J. Burnet, Early Greek Philosophy (chap. ii.), 1892: cf. J. Adam, Religious Trachers of Greece, 1908: also G. O. Griffith, Interpretations of Readily, 1946.

Herseles, see Herculks.

Herselian, or Heraellanus, one of the

Heracles, see HERCULES. Heracles, see HERCULKS.
Heraclian, or Heraclianus, one of the officers of the Emperor Honorius, to whom he rendered good service during the invasion of Italy by Alaric and the usurpation of Attalus. He revolted against Honorius in 412 and, proclaiming bimself emperor, collected ships for the invasion of Italy. This he accomplished in A.D. 413, but was defeated and put to death. He is said to liave murdered Stillcho in A.D. 408.

Heraclidæ (Ἡρακλείδαι), patronymic from Heracles, and consequently given to all his descendants, but more especially to those who invaded and took possession of the Peloponesus. It had been willed by Zeus that Heracles should rule over the empire of Perseus, but owing to a trick of Hera's, Eurystheus had taken first place, Heracles becoming his servant. After the death of the latter, however, his sons asserted their claims, and being led by Hyllus, the son of the hero by Delauira, they invaded the Peloponnesus to take possession of the countries acquired by

governor-gen. of Africa, and was born in Cappadocia about 575. In 610 he was sent by his father against Phocas, who had sent by his father against Phocas, who had usurped the throne of Constantinople, conquered him, and was elected emperor by the people. He found himself in a difficult position, for E. ompire was then in a miserable state, but he managed to get rid of the Avars in 619, and turned his attention against the Persians. The war which had broken out in 603 between Phocas and the Persian king was still raging, and in 616 Egypt fell into the hands of the Persians, so that Constantinople was deprived of its corn supply. Added to this, Constantinople, too, fell into the hands of the Persians the same year. H. wasted his opportunity, got ready an army, and commanding his troops in person, fought sev. battles against the Persians which resulted in the reconquest of Syria and Jerusalom, an against the Persians which resulted in the reconquest of Syria and Jerusalem, an achievement which seemed at the time impossible. But his glory was of short duration, and before he died, Syria, Palestine, Jerusalem, Mesopotamia, and Egypt came under the dominion of the caliph. H. apparently doing nothing to prevent this.

Hermum, temple of Hera, situated between Argos and Mvccne, and, according to Strabo, the joint sanctuary for both these tas. until the fifth century, when Argos vanquished the Myceneans. In 423 n.c. the old temple was burnt down, and the Argives erected a new one built by Eupolemos, in which was placed the great gold and ivery statue of Hera, by the sculptor Polyclitus. Excavations were made by the Amer. Archeological Institute and School of Athens, 1892-95.

Heraklion, (1) prov. of Crete, Greece, sltuated in the centre of the is. Pop. 162,900. (2) Cap. of the above, now known as Candia (q.n.).

Herald, officer of the Royal Household, who acted, and on certain occasions still tween Argos and Mycenie, and, according

who acted, and on certain occasions still acts, as messenger between sovereigns and is entrusted with the management of state is entrusted with the management of state ceremonial and who formerly superintended jousts, tournaments, and other public ceremonies and supervised coat armour. He was attended by 'pursuivants,' who were learning the duties of the H. The chief of the Hs. acquired the title of 'King of Arms,' and in England in the reign of Edward III. there were two kings of arms, Norroy and Surroy, but in Henry V.'s reign a new king of arms was instituted called 'Garter King of Arms,' and he, together with the other kings of and he, together with the other kings of arms and Hs., was in receipt of certain fees connected with public ceremonials and creations of peers. The Eng. kings of arms and horalds are under the control of the earl Marshal and still carry out state y Hynns, the son of the nero by Delanira, they invaded the Peloponnesus to take possession of the countries acquired by their ancestor. They were at first unsuccessful, but finally conquered Argos, Messenia, and Sparta, and estab. themselves there.

Heraclius, see Heracletus, Rom. emporor of the E. reigned from A.D. 610-641. He was the son of Heraclius the Elder, Lyon,' whose origin is lost in antiquity. It is one of the public courts of Scotland, is situated in H. M. Register House, Edinburgh, and deals with the heraldry genealogy, and state ceremonial of that kingdom.

In anct. Greece the Η. (κῆρυξ), Whose person was inviolable, was of great importance. He summoned the assemblies of the people, at which he maintained order and silence, proclaimed war, and assisted at public banquets and sacrifices. So, too, in Rome the 'Apparitores,' whose duties were similar to those of the Gk. siput, and the 'Fettales,' a special class chosen from the most distinguished chosen from the most distinguished families who managed the settlement of war and peace, were held in high esteem; only the 'Præcones,' who acted as 'criers' of public sales, etc., were despised.

Heraldry. The term originally denoted the knowledge and business of the herald, but it is now almost invariably applied to the science of armorial bearings. It has long borne this meaning having con-

to the science of armorial bearings. It has long borne this meaning, having supplemented the earlier name of armory. We find evidences of the use of some badge or sign to mark off a tribe, family, or individual, in the earliest days, and in all parts of the world. Homer and Aschylus describe the devices which the heroes bore describe the devices which the across bore on their whicks, and antique vases of classical times show many such. But H., in its local symbols, was a later development than was once thought. The Bayeux Tapestry, though it shows devices on the shields of the knights, proves also that these devices were not armorial bearings in the later were for in different ings in the later sense, for, in different parts of the tapestry, the same knight is represented with different devices. The mixture of nations caused by the Crusade must naturally have brought about a more must naturally have brought about a more regular system of insignia, and it is in the twelfth century that we must place the estab. of H. The striking feature is the way in which the science spread throughout Europe within a few years of its inception. It instantly and adequately filled the need, so pressing in illiterate days, of a simple system for identification of those occupying positions in public life. Its use in civil and domestic life, both for descretion and, especially, for legal pur-Its use in civil and domestic life, both for decoration and, especially, for legal purposes on seals, for authentication of deed, had more to do with its popularity than use in warfare. No effective substitute for it has ever been invented. The misuse of another's arms was treated as equivalent to forgery, so in order to be certain of acting correctly, it became the practice to consult the heralds, who were responsible for seeing that arms and banners displayed in the Royal Army were correct and known in the Royal Army were correct and known to the commanders. Identification of to the commanders. Identification of the unit in a foudal army depended solely on these devices. Early feudal magnates conferred arms on their vassals, usually based on their own arms; but, in cases of dispute, a grant from the king naturally prevailed over a grant from any subject, so the theory followed that valid arms must originate in a grant from the Crown, which exacted fees, as on every other which exacted fees, as on every other description of Royal grant.

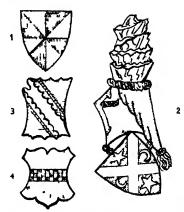

The prestige attaching to armorial bearings lies in the recognition that a grant of arms infers a grant of 'nobility, (in the continental sense), i.e. gentility, in Britain. It has been questioned whether in the continental sense), i.e. gentility, in lifitain. It has been questioned whether arms necessarily connote gentility in England, but in Scotland non-gentile people are expressly forbidden to bear arms at all. At the time heraldry arose, nobles alone required or had the opportunity of using arms. When a man acquired a feudal tief, or other public position, he received arms as a matter of course. Corporate hodies and cities were soon by analogy held to be persons who either were, or could be, ennohled by grants of arms, and nowadays corporate hordies are very jealous of any infringement of their heraldic rights. Early bearings were simple in character, and were generally chosen so that they might suggest the name of the bear of Berne are well-known examples. The heraldic movewell-known examples. The heraldic movement started in France and Germany, and con spread to Britain and the rest of Europe. In England it developed rapidly during the thirteenth and fourteenth cen-turies, reaching its climax in the reign of Edward III. In the nineteenth century a Edward III. In the nineteenth century a revival commenced, and the historic, scientific, and artistic importance of heraldry was realised. It has once more attained a level worthy of the esteem in which it was beld in the Middle Ages.

Heraldry is still a living science, and in England the Heralds' College (i.e. the Royal Officers of Arms incorporated in 1493) continues to exercise its functions.

1193) continues to exercise its functions. 1143) Continues to exercise its functions, Carter King of Arms is at the head of the College, and, under the control of the earl Marshal, makes fresh grants of arms (£77 upwards) and records pedigrees. In England it has been difficult to enforce the law, since the Registers of the College are private, and the officers remunerated from private, and the officers remunerated from a div. of the fees. In Scotland and N. Ireland, the kings of Arms are salaried officials, and the fees are collected for H.M. Tronsurv as part of the Inland Revenue. Ulster King of Arms formerly 'Principal Herald of All Ireland,' is now incorporated with Norroy, King of Arms of England. In Scotland, heraldy has seemed a more important standing than assumed a more important standing than in any other nation, largely owing to the clan system, with its veneration for lineage and kinship (see Lyon King or

ARMS).

In 1672, all older registers were super-seded by the 'Public Register of All Arms and Bearings in Scotland,' in which arms and Bearings in Sections, in which all existing arms were ordered to be registered within a year, as well as future grants. The striking feature of Scots heraldry is that there are relatively few surnames in Scotland, and therefore comsurnames in Scotland, and therefore com-paratively few basic coats of arms. The science has largely developed by differenc-ing these basic arms for the numerous off-shoots from the main lines of clans and families. These 'matriculations' are registered at lower fees on proof of the relationship. If this cannot be estab., 'Letters Patent (£48 upwards) are issued.

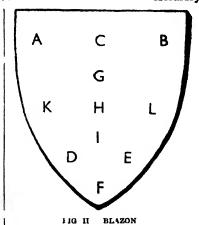

THE SHIFID AND ITS PARTS FIG. I

The Shield and its parts. At different periods the escutcheon or shield on which in a coat of arms the charge are placed in a coat of aims in charge the placed has varied considerably in shape. The simplest form and that most commonly used is shown in Fig. I. (No. 1 (amphell) Those shields were often placed at an angle, as in No. 2 (Haig of Benersydo), when surmounted by a helmet or crest angie, as in No. 2 (Haig of Beniers, do), when surmounted by a helmet of creet. This position is known is couche and is much the most artistic. It is that used in the stallplates of the Knights of the Garter and the Thi it and is the natural angle at which a shield hung from its quere or strop. In later times in it florid forms were used, such as are represented in No. 3 (Kortescue), such shields are of the late fourteenth or fifteenth entury and their somewhat is quere slape is noticeable. In the sectionth entury an even more flouid but symmetrial type of the base of the shield became nopular. The notch on the dexter chief of No., represents the lane rest. A wideling of the base of the shield became necessary as quarterity be une more commen.

Purpure (purple) represented by diagonal hateling from sinister chief to lexter best liest terms are also used to describe the harges if the charge is represented in its natural columnone of these conventional functions being used, these conventies if includes being used, it is said to be project. I light turs are also used as tinctures for fields. I rining is represented by black mails resembling those of the function to whate ground. Values said to be derived from the functional bells arranged in horizontal rows as shown in Fig. 111 (No. 9). It is a strict rule of H. that a colour must not be set upon profile. be set upon another but only upon a metal or a fur thus rone of the prime rules of the selence set it has sometimes ben violated de gnedly, in order to honour a grant by drawing stention to it such a breach of the rules was permitted to the Montmorencys, who assumed a silver cross upon a gold a field in order to cmphasize that their, was the first family in Gaul to become Christian and similarly breach on behalf of John Codlington, standard bearer to the king at Agincourt.

Directors of fields — kields are divided to the control of the con

m numerous ways so that the different parts may have different tineture and

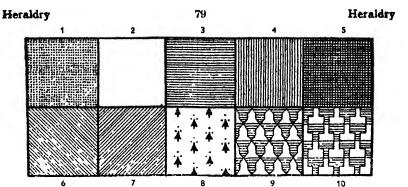

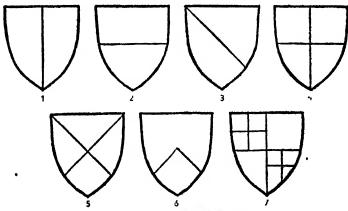

FIG. III. TINCTURES

divided as in Fig. IV. No. 1 is said to be alone, but more commonly they appear in A pale is a perpendicular strip (see bibit). Combination with some other tigures, or A pale is a perpendicular strip (see bibit), and an escutcheon bearing three pales of one tincture upon a field of another time, making six pales in all, is blazoned as paly. Other methods of dividing a shield marked of by a line of div. Accordingly and the pales of divided as in Fig. IV. No. 1 is said to be alone, but more commonly they appear in of its diss again quartered, and is de-scribed as counterquartered or quarterly - chief. (2) The Fess is a horizontal band quartered. The large diss, are then a cross the centre of the shield occupying known as the Grand Quarters. Thus in one-third of the depth, though it and the

known as the Grand Quarters. Thus in one-thred of the depth, though it and the No. 7, the top right and bottom left are pale, which should also occupy a third of counterquartered, the other divs. being the whole space, actually vary, as does grand quarters.

Ordinaries to the chief. (3) The Pale has already been cyclained as a vertical band in the centre given to certain of the carliest devices of the field. It is not common. (4) The H. They are marked by simplicity of Cross appears in numerous forms, of which the best known are those which straight lines. Occasionally they appear appear in the Union Jack. The study of

DIVISIONS OF FIELDS FIG. IV.

the cross in H. is complicated by the fact that many of the forms have themselves undergone much adaptation in different according to the position or condition of times and under different hands. The cross should occupy one-fifth of the field unless charged, when it occupies one-third. (5) The Bend is a band crossing the shield from the dexter chief to the position or condition of the charges are described monothers. The charges are described monothers. The charges are described monothers. The lien, in particular, being the most popular beast in medieval II., is found in many positions. Thus it is described as a iton rampant, rampant gardant, salient, sejant, couchant, being the most popular beast in medieval II., is found in many positions. Thus it is described as a iton rampant, rampant gardant, salient, sejant, couchant, being the most popular beast in medieval II., is found in many positions. field unless charged, when it fills one-third. The bend sometimes appears over other charges and in a narrower form, sometimes called the Baston, it was commonly placed over the arms of a younger son. There is no such thing as a 'bar-sinister' in heraldry, but a baston-sinister is one of the marks used to indicate illegitimacy—usually in the case of royal bastards. All charges placed on a bend are put bendwise, that is to say, they are slanted at the same angle as the bend. The last instance of the batter stricts according to the contract of the same angle as the bend. of the baton sinister occurred as late as the nineteenth century, in the arms of the earl of Munster. Modern H. has adopted another device in its place—the bordure wavy—to denote bastardy in England; while in Scotland it is denoted by the bordure company. In England alone the lesson is driven home by means of a bendlet sinister wavy, or a pallet wavy, on the crest. (6) The Chevron is formed from two bands starting respectively from dexter and sinister base and coming together about the honour point. It should occur one-fifth of the field. of the baton sinister occurred as late as the trom dexter and simster base and continued together about the honour point. It should occupy one-fifth of the field.

(7) The File is a triangular wedge-shaped tigure generally commencing at the middle chief and tapering downwards.

(8) The Quarter is formed of the first quarter of the shield cut off by lines. It is quarter of the shield cut off by lines. It is now very uncommon, having been sup-planted by the canton, which is smaller but of the same form. Other ordinaries are the Scotchoon or shield used as a charge; the Tressure, a narrow border which follows the edge of the field (in Scotland a double Tressure Fleury Counterfleury is a high honour and never shield cut off by curved lines; the Fret, formed by diagonal lines crossing or inter-lacing. A field entirely covered by a fret is described as fretty. A gyronny field is one divided both per fesse and per saltire. The Lozenge has an clongated form termed the fusil. Billets are oblongs set vertically. Roundels may be considered together with the ordinaries. They contogether with the ordinarios. The consist of disks or balls of various colours; they have received different names according to the colours. Thus the bezant is or; the plate, argent; the hurte, azure; the tortrau, gules; the pellet, asble; and the pomme, vert. The first two of these and the fountain, which is a rounded divided horizontaily by navy roundel divided horizontally by wavy lines, are represented as flat, but the others are shaded to appear spherical. The ring or annelet is also a common charge.

Common charges.—Under this head are grouped representations of animals, birds,

rampant gardant, rampant regardant, passant gardant, salient, sejant, couchant, etc. We have also such forms as the deetc. We have also such forms as the demilion and the lion's head crased. Other common charges are the stag, leopard, eagle, dolphin, griffin, escallop, rose, fleur-de-lys, estolle (star), and various kinds of trees. The demi-lion, demi-man, demi-rose, etc., show the figure couped or cut off in the middle.

Differencing .- The undifferenced arms, i.e. the whole coat, is borne only by one person, and is by him banded on to his heir. Until he succeeds to the undifferenced coat-of-arms, the heir wears it with some difference, the commonest being the addition of a label. Younger sons also differenced the puternal arms, and this was done in various ways, sometimes by a change of tincture, or by the imposition of a bend, or by surrounding the arms with a bordure.

Marshalling,—To marshal arms means to combine sev. independent coats on one shield, and is used chiefly to denote marriage, or the representation of other families through heiresses. At first, a woman used the undifferenced arms of her father, and the shields of husband and wife were placed side by side, termed accollec-Later on, they used one shield, divided per pale down the centre, the husband's arms being placed in the dexter half of the

shield, the wife's in the smitter half.

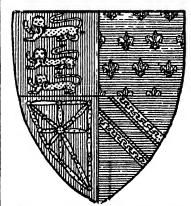

FIG. V. ARMS OF QUEEN ISABELLA

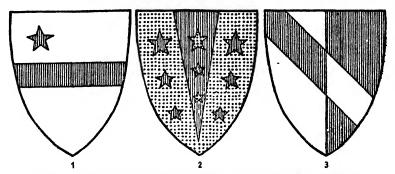

Official arms, such as those of Eng. bishops and certain high officials, are also impaled with the family arms of the prelate or officer. In this case, the official arms are on the sinister. The practice of quartering became common in the four-teenth century. When a man married an

heiress, or inherited arms from an heiress mother, it was often desirable or necessary to display both coats, and where a family had married successive heiresses, it was convenient to divide the shield in four or convenient to divide the shield in four or more divs., and put the arms of the suc-cessive heiresses in each. Quarters are numbered: (1) Dexter chief; (2) sinister chief; (3) Dexter base; (4) sinister base. If it is necessary to quarter many arms, the shield is divided into more compartments by vertical lines, but the divs. are still called by the same name. In Eng-land, the shield may be divided into any number of quarterings, but in Scotland a shield can only have four quarterings. Scots quartering added requires a rematriculation. An early example of quartered arms may be seen in those of Isabella, wife of Edward II., who bore in

and the name of no colour is repeated if and the name of no colour is repeated if it can be avoided. Thus the arms of Robert de Chandos, differenced with mullets as a mark of cadency are shown in No. 2 of Fig. VI. These are blazoned, 'or a pile gules charged with three mullets of six points gold between as many others of the second.' The ordinary, however, is named last if it surmounts another charge. When a bend or fesse crosses a field of two tinctures, it is often counter. charge. When a bend or fesse crosses a field of two tinctures, it is often counter-changed, i.e. the colour of the bend, etc., is reversed as it crosses the field. This can

of reversed as it crosses the neid. This can be seen from the arms borne by the poet Chaucer (No. 3), 'per pale, argent and gules, a bend counterchanged.'

The Helmet.—Above the shield is set a helmet: gold with grills, for sovereigns; eilver with grills, for poers; steel with open visor for knights and baronets;

ARMS OF ODINGSELES, ROBERT DE CHANDOS, AND CHAUCER

the four quarters the arms of England, France, Navarre, and Champagne (see Fig. V.). A husband may always impale Fig. V.). A husband may always impale his wife's arms, whether she is an heiress or not, but in England the practice has arisen of depicting the arms of an heiress wife upon an inescutcheon of pretence, viz. a small shield in the middle of the husband's shield. The arms upon the inescutcheon become a quartering in the next generation.

Blazoning .- To blazon a coat-of-arms is to describe it accurately so that it could be reproduced by anyone having a knowledge of H. Besides the conventional terms of which the most important have been explained above, there are certain other conventions to be observed, chiefly as regards the order. First is named the field, in one word if it be of one tincture. If it be a quartered held, the tinctures are named in order, preceded by the manner of partition. Then follow the charges, the most important being named first. If a most important being named first. If a charge is in any position other than the centre of the field its position is described.

steel with closed visor for esquires and gentlemen. The Royal Helmet is always gentlemen. The Royal Helmet is always shown full face and affronté. In England shown full face and airronte. In England there are seventeenth-century rules that peers, 'esquires,' and gentlemen's holmets must be shown in profile, knights' and baronets' full face. In Scotland, provided the correct type of helmet is displayed, it may be shown at whatever angle best suits the crast.

To mitigate the heat of the sun upon a below it was every suits.

To mitigate the heat of the sun upon a helmet, it was covered by a cloth cap, which became jagged in battle, and in this form is known as the mantling or lambrequin. Its lining is the colour of the prin. 'netal' of the shield, its outside the prin. 'colour,' but peers' mantlings are lined ermine, and in Scotland are crimson outside. At the joint between the mantling and the crest is a twisted skein of silk of the prin colours and metal of the arms. ing and the crest is a twisted skein of silk of the prin. colour and metal of the arms, termed the wreath, or torse. Above this is the crest, which originated in a fan or plume of feathers, but in the fitteenth and sixteenth centuries developed into a weighty device moulded out of leather or wood, more frequently used at tournaments and ceremonial than in warfare. 'Horaldic stationers' invariably draw the helmet and crest much too small in re-Thus Odingscles bore the arms depicted in Fig. V1. No. 1, which are blazened as argent a fesse gules with a molet gules in the quarter.' Sometimes the ordinary is the helmet and crest much too small in reitself blazened. Repetition is avoided, lation to the shield, the actual proportion-

Fig. I., No. 2.

Supporters.—Peers, and in Scotland chiefs of clans and a few others, are entitled to have their shield and helmet supported by two creatures (usually human beings or animals). These are considered, a high honour, granted only in exceptional circumstances, and they de-scend to the peer or chief only for the time being, and not to the younger sons. Wives and widows of the peer or chief may use them, but not daughters. In Scotland they are borne also by the son and heir to whom they will eventually

and her to whom they past is an helrest of entail in Scotland.

Royal Arms.—These 'ensigns of sovereignty,' or 'symbols of public authority,' are governed by different rules. from other arms. They do not pass by succession, even to younger sons of the sovereign, such princes each receiving specially differenced versions by Royal Warrants direct d to the Lard Marshal or the Lord Lyon. Where a king successions the consequence of the succession of the consequence of the c ceeds to the sovereignty of more than one state, a quartered royal coat-of-arms results. Thus, the Brit. Royal Arms now melude quarters representing the sovereignty of England, Scotland, and Ireland. Until 1800, the kings of England claimed to be, and styled themselves, kings of France, and therefore quatered the Fr. illies. From 1714 until 1837, the Brit. Sovereign was also king of Hanover, the arms of which were placed on an escut-cheon, but under the Sale Law that kingdom did not pass to Queen Victoria, and accordingly the arms of Hanover were dropped. The Prince of Wales bears the Royal Arms, differenced by a label as heir apparent, and with an escutcheon of the arms of the principality of Wales. The Royal Arms of each soversign state indicate the public authority of its ruler; that is, the three leopards of England, the tressured lion rampant of Scotand, and tressured from rampant of Scotaind, and the blue field and golden harp of Ireland, indicate the public authority of the ruling power, within each state; the National Placy (St. George's Cross for England, St. Andrew's Cross for Scotland, St. Patrick's Cross, a green flag with a golden harp, for Ireland) indicate national identity. Similarly, the quartered Paral (St. Window) presence indicate national identity. Similarly, the quartered Royal 'Standard,' properly Banner, is the insigna of the ruling authority—the Grown, in Great Britain; the nomed crosses, or Union Jack, the national flag, indicating Brit. national identity.

Heraldic Flous.-Armorial were not confined to the shield or tabard worn over the armour, which was the literal coat-of-arms often seen on anct. sepulchral brasses, but were also used in flags or banners, a term which refers to a rectangular flag displaying the cont-of-arms, whilst pennons and standards are long, pointed flags usually displaying the

as used and drawn in the fourteenth plates, book stamps, silver-plate, seals, and differenth centuries will be seen in and signet rings, stamped or tooled leatherwork.

Inland Revenue .-- In Great Britain there is an ann. duty of one guinea for use of armorial bearings, two guineas for use on a vehicle. Payment of these duties does not give the right to appropriate a coat-of-arms, and is equivalent merely to a licence to keep a dog, gun, or motor. A cont-of-arms must be obtained through Garter, Lyon, or Ulster, and in Scotland payment of the ann. duty is no defence in a prosecution for use of unregistered arms. See also under LORD LYON KING OF ARMS. See also under Lord Lyon King of Arms.

Heralds' College, or College of Arms, corporation founded by Richard III. in 1183. It is presided over by the Earl Marshal (whose ofter is hereditary in the tamily of the duke of Norfolk), and consists of the duke of Norfolk), and consists of the Garter, Prin, king of Arms of England; Clavenceux, king of Arms N. of Trent; Norroy, king of Arms N. of Trent who now also holds the office of Uster King of Arms; the heralds named Chester Windson, Langaster Richmond Chester, Windser, Lancaster, Richmond, York, and Somerset; and four pursulvants, Bluemantle, Portcullis, Rouge vanis, Bluemantle, Pottenllis, Rouge Pragon, and Rouge Cross. They at first resided at Cold-harbour, or Pulteney's Inn, in the par, of All saunts, but in 1554 Queen Mary gave them a building opposite St. Benet's, which was rebuilt after being burnt down in 1660. The heralds-extraordinary appointed by the front are not members of the H. C. The H. C. has no juri-diction in Ireland, where I later king of Arms controls heraldry, nor in Scotland whose heraldry is under control of the Lord Lyon king of Arms (g.r.).

Herat, (1) fort, and second largest city of Alghanistan, in the prov. of H., on the R. Heri Rud, about 410 m. W. of Kabul. It is situated in a valley about 120 m. long by 12 m. wide, and is built on an artificial mound nearly 1 m. sq. and 55 ft. in height. It was for a long time the cap. of the extensive empire ruled by the descendants of Tinur; but its chief importance now lies in its strategic position, being regarded lies in its strategic positions of the same as the gateway to Afghanistan and India. The manufs, include silk, leather, and woollen goods, and carpets. Oil has been woollen goods, and carpets. Oil has been found in the vicinity, Pop. 85,000.
(2) Prov. of N.W. Afghanistan, pop. 770.000.

badge and motto only.

Use of Herudry.—Heraldry is used in almost every conceivable way. In architecture, stained windows, and carring in Lyons. The surface of the dept. is varied, wood and stone, and on furniture, book-

rise two hills, the Pilier de Saint-Clair and | and in his criticism in 1796 of Schelling, Saint-Loup, and behind this sandy tract lies a series of pools (dangs), and behind these again plains and bills. The riva-are the Aude, the Orb, and the Herault. The dept. Is especially famous for its wine, one-third of its surface being planted with vines, but wheat and oats are also grown. Fruit trees, too, ilourish, but especially mulberries, clives, and chestnuts, and silk-worms are reared. There is considerable mineral wealth, coal, iron, copper, and sea-sult being found in large quantities. The chief manufa, are coarse cloths, brandy, soap. The dept. is divided into brandy, soap. The dept. is divided into the 3 arrons, of Montpollier, Béziers, and Lodève. Cap. Montpoller. Area 2402 sq. m.: pop. 461,100. (2) Riv. of France which rises in the Cevennos and enters the Mediterranean near Agde. It has length of 122 m.

Herbarium, also called Hortus siccus, or dry garden, is a systematically arranged collection of dried plants, intended to facilitate the study of botany. The specimens are prepared by being laid between sheets of blotting or botanical paper and afterwards subjected to pressure the stream with the systematics. sure; certain flora, such as orchids, c.c., have to undergo special preparation because their succulonce admits only of Mariborough College contains the Wedgwood collection of dried plants, while the H. of Manchester Yuseum was presented to it in 1901 by its founder, J. C. Melvill. Paris contains a notable H. in the Jardin des Plantes, while the H. in Berlin sattached to the univ. Brussels, Geneva, Vienna, and Leningrad also have good herbaria. In S. Africa the National H. is estab. in Pretoria; in India, in Calcutta; and in Australia, in Melbourne. The U.S.A. can boast of sev. H, containing mainly flowers of America; among these are the Gray H, (founded by Asa Gray) of Harvard Univ. and the H. in the New York Botanical Garden. The Field Museum of Natural Hist. in Chicago Field Museum of Natural Hist, in Chicago (founded by Marshall Field in 1893) also contains a very carefully classified 11. contains a very carefully classified II. See C. F. Millspaugh, Herbarium Organization, 1925.

Herbart, Johann Friedrich (1776-1841), Ger. philosopher and educationist, b. at Oldenburg. He began to study logic at the age of cleven and metaphysics when twelve, and at the gymnasium of hisnative the, which he entered in his thirteenth year, his favourite studies were physics and philosophy. In 1794 he left this institution and went to the univ. of Jena, becoming the pupil of Fichte, but began to disarree with his master. the age of cleven and metaphysics when he soon began to disagree with his master,

whose philosophy he considered the most logical form of Idealism, he says: 'How-ever many happy thoughts may be seat-tered about in Fichte's deductions regarding natural right and morality, I consider the fundamental points, i.e. his theory of the fundamental points, i.e. nis theory of the recognition of a reasoning being as such, and his doctrine of freedom, as false. Leaving the univ. in 1797, he acted as private tutor for two years, and then went to Bromen to study philosophy, publishing his views on educational publishing his views on educational publishing his views on educational reform in 1801, Ideen zu einem pädagoguschen Lehrplan fur hohere Studien. This was followed in 1802 by his essay on Pestalozzi's work, If ie Gerfrud thre Kinder Petalozzi's work, Wie Gertrud thre Kinder thrt, as well as by a treatise on the same author's Idee eines A B C der Anschaumg. The same year he went to Göttingen and pub. A B O der Anschaumg (1802), Die arthetische Darstellung der Well als das Hamptgeschäft der Erzichung (1801), Standpublich der Beurtheilung der Pestalozzi's scha Unterrichtsmethole (1801), Allgemeine Pedagogoik (his prin work on edwascha Unterrichtsmethole (1891), Allge-meine Padagogik (his prin. work on editea-tion), Hauptpunkte der Metuphysik (1806), Hauptpunkte der Lonk (1806), and Alle-gemeine pruktische Philosophie (1808). In 1809 he accepted the chair of philosophy at Konigsberg, und pub. in 1812 Lehrbuch zur Lin leitung in Philosophie, his best known and most widely read book. His chief psychological work Psychologies nave to undergo special preparation of cause their succulonce admits only of slight pressure, and they are sometimes placed in hot and or suspended before a fire. Mosses, hear as and similar plants can be preserved dry in packets; when moistened they regain their appearance milic. The largest fit in the world is contained in the Royal Botauli al Garden, at Kew, which is constantly receiving new additions from the various colonies and as the result of botannal expeditions and explorations. The collection made by Carl Linnaus bas been the property of the Linnaus presentations (Vorsellungen). He also pub. in 1831, Encyclopadie der Philosophie. In 1833 be returned to Gottingen, where he spont his last years, and wrote in 1833, as a supplement to Allgemeine Padagogik, Umriss padagogischer Vorlesengen. II. is Umriss padagogischer Fortevengen. H. is proportant as being the only modern thinker who has not treated education casually in his works; indeed, for him it was the starting-point and end of all his myestigations. He says himself, 'I for my part have for twenty years called to my aid metaphysics and mathematics, besides self-observation, experience, and experiments, in order only to find the foundation of true psychologic knowledge.' He imbibled the ideas of Pestalozzi, his friend, and did much to make education and educational methods a science. As to his and did much to make education and councational methods a scionce. As to his philosophy which was based on that of Kant, the cardinal point of his ontology is that it is a "pluralistic realism." As a metaphy-ician II. proceeds from what he calls 'the higher scepticism' of the llume-Kantlan sphere of thought, the source of which he sees in Locke's perpleyity ever the idea of substance. By this scentificant the real validity of even this scepticism the real validity of even the forms of references can be questioned

to involve; but that these forms are given to us as truly as sensations are, follows incontestably since we can as like control the one as the other. Amongst the post-Kantian philosophers H. ranks next to Hegel in importance, apart altogether from his great contributions to the science of education. 'His criticisms,' science of education. 'His criticisms,' says Dr. James Ward, 'are worth more than his constructions; indeed for exactness and penetration of thought he is quite on a level with Hume and Kant... But we are most of all indebted to Herbart for the enormous advance psychology has been enabled to make, thanks to his fruitful treatment of it, albeit as yet (1880) but few among the many who have appropriated and improved his materials have ventured to adopt his metaphysical and mathematical foundations. See H. A. have ventured to adopt his metaphysical and mathematical foundations.' See H. A. Fechner, Zur Kritik der (irundiagen von Herbarts Melaphysik, 1853: T. Herbede, tn. in the dist. of Arnsberg, Westyhalla, Germany, on the Ruhr. It has stone quarries and coal-mines, Pop. about 6800.

Herbelot de Molainville. Barthelemy d'

has stone quarries and about 6800.

Herbelot de Molainville, Barthelemy d' (1825-95), Fr. Orientalist, b. in l'arris, Ho was educated at the univ. of Paris, and made a special study of Oriental languages. He visited Italy to continue his guages. He visited traily to continue as work, but returned to France and became secretary and interpreter of E. languages to the king. In 1692 he became prof. of Syriac in the Collège de France. His Hibliothèque orientale, ou Dictionnaire universel contenant tout ce qui regarde la sonnoissance des Peuples de l'Orient (1697) is based on the Arabic dictionary of Hedii Khalfa. Hadji Khalfa.

Haddi Khana.
Herbert, name of a family prominent in Brit. hist., who came over to England with the Conqueror (1066). II. Fitz-Herbert (II. of Winchester) was chamberlain and treasurer to Henry I. (1100-35).

in view of the contradictions they are seen | England, Wales, and Ireland. The earls to involve; but that these forms are of Carnaryon are descended from the reiven' to us as truly as sensations are, eighth earl of Pembroke (1656-1733), who held office under Anne.

Herbert, Alan Patrick, Sir (b. 1890), Eng. poet and politician; son of an official of the India Office; educated at Winchester the India Office; educated at Winchestor and New College, Oxford. A modern Euphulst in verse and a satirist—most of his verse appears in Punch and in the Sunday Graphic. Has also written novels, the best being The Water Gypsics (1932), Trials of Topsy (1932), Topsy, M.P. (1932). Huly Deadlock (also a novel, 1934), is a prepagnitist effort singulat a prepagnitist effort singulat a prepagnitist of the state is a propagandist effort, aimed at anomalies in the law of divorce. In 1935 he was olected M.P. (Independent) for Oxford Univ. and, in 1937, greatly distinguished himself by securing the passage of an Act radically amending the divorce laws. Knighted 1945. With T. F. Dunhill, he produced a successful musical comedy. Tantity Towers (1931); and revues Eig Ben (1946). Bless the Bride (1948). Other books: See Sharker (1977) Will-Judical books: Sea Shanties (1927), Mislcuding Cases (1937), Plain Jane (1931), Less Nonsense (1944), Point of Parliament (1946).

Herbert, Edward, first Lord Herbert of Cherbury (1583-1618), philosopher, historian and diplomatist, b. at Eyton-on-Severn, near Wroxeter. He was educated at Univ. College, Oxford, and while there taught himself Fr., It., and Sp., besides gaining some proficiency in music, and becoming a good relay and force in and becoming a good rider and fencer. In 1600 he presented himself at court, and was sheriff of Montgomeryshire in 1605. In 1608 he set out on a foreign tour, and became friendly with the grand constable of France, N. de Montmorency, and Casaudon. In 1614 he joined the army of the prince of Orange as a volunteer, and stayed abroad two years, visiting the Elector Palatine and the duke of Savoy. On his return he became intimate with Donne, Carew, Ben Jonson, and Selden, all of whom held him in high esteem and encouraged him to pursue his studies, but in 1619 he was again taking part in public affairs, and was made Eng. ambas. at Paris. While holding this post he tried to bring about a permanent alliance between England and Holland, endeavoured to gain Fr. support for the Elec-tor Palatine on the outbreak of the Thirty Years' war, and suggested a marriage between Prince Charles and Henrietta Maria, but in 1621 he was recalled for quarrelling with De Luynes. He was created Lord Herbert of Cherbury in 1629, and in 1632 a member of the council of war, being reappointed in 1837. He aimed at neutrality during the Civil war, but was forced to admit the parl force into Montgomery in 1644. H.'s philosophical Montgomery in 1044. H.'s philosophical work, De Veritate, is important as being the earliest purely metaphysical treatise written by an Englishman, and is interesting for its theory of perception. He makes the mind consist of faculties which have reducible to found expert of which the lain and treasurer to Henry I. (1100-35). Montgomery in 1644. H.'s philosophical The first curl of Pembroke (created 1468) work, De Veritate, is important as being two sa a member of this family, and the title was revived for Sir W. Herbert (c. 1501- 1570) in 1551. The fourth carl became also earl of Montgomery (1605). Some generations later the H. family diverged into sev. distinct branches, including the lines of the earls of Powis, of the Lords H. Aristotelian voic), the other three being of Cherbury, of the H. of Muckross (Kerry, Ireland), and of sev. untitled branches in

(1645), and completed his religious views | in De Religione Gentilium, pub. in 1663 (Eng. trans. 1709). He makes all religions, Christian and pagan, resolvable into the five innate ideas, that there is a God, that He ought to be worshipped, that virtue and picty are essential to worship, that man ought to repent of his sins, and that there are rewards and punishments in a future life. H.'s Poems were pub. in 1665, and reprinted in 1881; his historical work, The Life of Henry VIII., appeared in 1649. Herbert, George Edward Stanbope

Molyneux and Henry Howard Molyneux,

see CARNARVON, EARLS OF.

Herbert, George (1593-1633), divine and poet, vounger brother of Lord Herbert of Cherbury, b. at Montgomery Castle in Wales. He was educated at Westminster and Trinity College, Cambridge where he was made a fellow in 1615. In 1618 he was prelector in the rhetoric school at

GEORGE HERBERT

Cambridge, becoming in 1619 public orator, and in that capacity drew the notice of King James by his Lat. vorses-eulogising the king's Basilaon Doron; and for a time he tollowed the court and made many distinguished friends. But the death of the king and of his patrons, the duke of Richard and the macaness. enlogising the king's Basilaon Doron; of the Civil war he adhered to the side of and for a time he followed the court and made many distinguished friends. But the death of the king and of his patrons, the duke of Richmond and the marquess of Hamilton, ended his clanaces of court performent. He was, however, easily persuaded to adopt the religious life in 1626 by Ferrar, and was ordained priest in 1630 and received the living of Bemerican, Wiltshire. Here he wrote his sacred poems, afterwards pub. by Ferrar, The Temple; Sacred Poems and Private Ejaculations (1633), which were read by Charles I. in prison, and much praised by Henry Yaughan, Baxtor, Coleridge, and Crashaw. H. gave the Anglean Church the finest expression in verse, and on that account is a treasured Eng. heritago. He has not always been given that representative position, and the high regard in

which he was held in the seventeenth century waned early in the eighteenth, and for a century or more his poetry was considered uncouth. Coleridge did much to restore its favour and it has received sympathy and understanding from modern scholars. It is noted for its colloquial phraseology, pliable verse-forms and quiet music. His chief prose work, A Priest to the Temple, was first printed in his Remains (1652). H.'s poetry is sometimes said to show the influence of Donne, but said to show the influence of Donne, but whereas Donne, as a 'metaphysical poet,' tends to obscurity, the very simplicity of H. is the secret of his power; and where Donne's conceits are the pith of his thought those of H. are mostly illustrations of a thought which really require none. Donne, too, was a rebel against klizabethan literary fashions, H. was an adherent to them—as is shown by the fact that The Temple contains many cuphulans and diagrammatic conceits, besides a number of souncts. See The Works of George Herbert, ed. by F. E. Hutchinson (1941), who has restored the text of both the Eng. and Lat. poems to their original state.

state.
Herbert, Sydney, first Lord Herbert of Lea (1810-61), Eng. statesman, b. at Richmond. In 1832 he was Conservative member in the House of Commons for the S. div. of Wiltshire, and made his first speech in 1831, when he seconded Estcourt's amendment to Wood's Bill for admitting dissenters to the univs. He held say appointments under Peel, and admitting dissenters to the univs. He held sev. appointments under Peel, and in 1815 was transferred to the office of secretary for war, with a seat in the cabinet. In 1852 he again held this position under Lord Aberdeen, and became Colonial Secretary in 1855. He was responsible for the War Office during the Crimean War, and took a leading part in the movement for armfy reform after the war. He was also interested in the hospitals at Scutari, and it was he who sent out Florence Nightingale. In 1859 he was again secretary for war under

sent out Florence Nightingale. In 1859 ho was again secretary for war under Lord Palmerston, and in 1860 was made Baron Herbert, Sir Thomas (1606-82), Eng. traveller and author, b. at York. In 1628 went to Persia with Sir Doldmore Cotton and Sir Robert Shirley. On the outbreak of the Civil war he adhered to the side of the mand Sir Mandella and Sir Washington and Sir Robert Shirley.

producing some thirty-five. His best works are Woodland Fancies, an orchestral and teander (op. 33), first performed by the New York Philharmonic Orchestra in 1902. His best light operas are The Wisard of the Nule (1895), and The Idol's

Wisard of the Nile (1895), and The Idol's Eye (1897).

Herberton, th. in Cardwell co., Queensland, Australia, is 50 m. S.W. of Cairus. It is an important mining centre; thn. gold, silver, lead, and copper are found in the dist. Pop. 3000.

Herbertshohe, settlement on Blanche Bay, N.E. of Neu Ponmern, the seat of gov. of the Bismarck Archipelago, the Ger. Solomon Is. and Ger. New Guinca until 1909; administered since 1920 by the Commonwealth of Australia. The the Commonwealth of Australia. chief products are tobacco, cotton, coffee, Pop. about 1200.

Herbivora, name applied, because of their exclusively herbivorous diet, to the marsupials, contained in the sub-order Diprotodontia; kanguroos, wallabies, etc.,

Inprotodonta; kangarous, wananes, etc., are typical examples.

Herbs are plants with soft, succulent stems that wither away after flowering, leaving no woody or per-latent growth above ground, but may also include plants of which the leaves shout. Sowers or solve ground, but may also in that plant of which the leaves, shoots, flowers or seeds are used for food, flovouring, medicine, or perfume. Cultural requirements are simple, chiefly a sunny site and a wolldrained, medium-rich soil. Garden II. are usually raised for culinary purposes. are usualy raised for cumuary purposes. Angelica, anise, borage, caraway, chervil, coriander, dill, fennel, sweet murjoram, parsley, purstane, summer savory, sorrel, sweet basil, sweet cicely, and rampion are raised from spring-sown seed. Lialm, chires, lovage, pot marjoram, pennyroyal, conves, lovely, pot marjoram, pennyroyan, rosemary, horehound, hysson, lavender, mint, rue, sage, winter savory, southernwood, tansy, tarragon, and thyme may be propagated by cuttings or root div. Many H. have salad uses. H. for drying are hardvested just as flowering begins, and dried quickly in shade, hung downwards in a current of air. Seeds are harvested when ripened. Pot-H. is a term usually applied ripened. Pot H. Na term usuam appired to vegetables such as carrots, tunips, etc., cut up and mixed with flavouring herbs for soups, etc. Medicinal H. Such as for glove and deadly nightshade, and scented H. such as lavender and south rinwood, the such as lavender and south rinwood, the such as lavender and south rinwood. are grown commercially on herb farms. A careful choice of site and soil, skill in culture and harvesting, and good marketing are essentials of success.

Herbs, Medicinal, see MEDICINAL. Hercegnovi, or Castelnuova, chief tourist place in the romantic ford of Boka Kotorska, Yugoslavia, with medieval monuments and rich Mediterranean flora.

Pop. 1500.

Herculaneum, anct. city of Italy, situated at the foot of the W. slope of Mt. ster at the root of the we stope of the vesseling, close to the Portici Station, a short distance from Naples. The visible ruins are not so well-known as Pompeii, being much smaller in extent and less visited. The city was probably founded by the Oscans, and it appears to have belonged to the Etruscans, and during the Sample wars became Rom. According to

Soneca, it suffered from a severe earth-quake in A.D. 63, and Pliny the Younger describes how it was destroyed by the terrible cruption of Mt. Vesuvius in 79. The city was then entirely buried under showers of ashes, stones, and streams of lava; few, if any, people could have escaped. Its very name was forgotten in the Middle Ages. In 1719, Prince Elbeuf discovered the anct, site by acci-dent in a source for pushe for the ville. Seneca, it suffered from a severe earthherein discovered too anct, site by accident, in a search for marble for the villa he was building at Portici; he learned from the peasants that there were pits quite close from which they obtained marble and had also extracted many statues. Excavations began on a small scale: Excavations organ on a small scale; the theatre, many houses, the forum, and the basilica were discovered, with valuable and beautiful statues and painting; in the Villa suburbana, a number of bronze and marble busts and statues, and especially a library of valuable papyri, containing works by Epicurus, Philodenus, etc. Anong the most famous statues rescued from the runs are the reposing Hermes, the drunken Silenus, and a pair of wrestlers or runners; these were all in black bronze, and are now in the Naples Museum. II., as we know, not only from the works of art discovered, but also from contemporary sources, was inhabited by a more cultured, refined, and intellectual class than the neighbouring to of Pompeis (q.v.). Verrly the whole site of the city is occupied by the in. of ite-ina, and, therefore, it is difficult to even to; also, owing to financial trouble excurate; also, owing to linancial trouble with the property owners, the proposals for systematic excavation, begun 1908, were temporarily stopped. Further operations, in which muchinery for breaking up the hard crust is employed, were undertaken in 1927-30. H. sustained no damage in the recent World War. See C. Waldstein, and L. Shoobridge, Herculaneum, Barten and krature 1908. stem, and L. Shoobridge, Her. Past. Present, and Future, 1908.

Herculano de Carvalho y Avarijo, Alexandre (1810-77), Portuguese poet and historian, b. at Lisbon. Ho was educated for a commercial career, but had to leave for a commercial career, but had to leave Portugal in 1831, when the country was under the despotic ruler Dom Miguel. In 1832 he pub. A Voz de Propheta, and in 1831 J. Harpa do Crente, in which he describes the bitterness of extle, etc., proving himself to be a poet of feeling. In 1837 he founded the Panorama, in imitation of the Eng. Penny Magazine. This paper had a wide circulation, and II.'s articles were very popular with the middle class. In 1841 he started a new venture, and wrote historical novels in imitation of Sir Walter Scott, viz. Enrico venture, and wrote historical noves in mutation of Sir Walter Scott, viz. Enrico (1888), and Monge de Cister, but his greatest work was his History of Portugal from the Beginning of the Monarchy to the end of the Reign of Alfonso III. (1846-68). This book was regarded as a historical work of the first rank, and is still reckoned aroung the Portugalse algasics. See life

work of the first rank, and is still reckoned anong the Portuguése classics. See life by V. Nemerio, 1934, Hercules, son of Alexander the Great and Barsine, the widow of Memnon. He lived at Pergamus, and in 310 B.C. was brought forward by Polysperchon (a dis-tinguished officer of Alexander the Great,

who had been appointed in 319, on the against Troy and killed Laomedon, dedeath of Antipater, regent, and guardian feated the Meropes and killed Eurypylus, who had been appointed in 18, on the death of Antipater, regent, and guardian of the king) as clumant to the Macedonian throne. He was, however, murdered by Polysperchon in 309, when the latter became reconciled to Cassander.

Hercules or Heracles ('Πρακλή,), most celebrated of all the heroes of antiquity, was the son of Zeus by Alcmene of Thebes in Bœotia. His stepfather was Amphitryon, who was the son of Alcaus, the son tryon, who was the son of Alexans, the son of Perseus; and Alemene was a grand-daughter of Perseus. Hence II. belonged to the family of Perseus. On the day destined for the birth of H. Zeus boasted that a son was going to be born to him who should who compatible to the company of the perseus. who should rule over the house of Perseus, whereupou Hera, having exacted from him a promise that the descendant of Perseus b. that day should be ruler, hastened to Argus, and caused the wife of Sthenelus (son of Perseus) to give birth to Strengthens, and delayed the birth of H. by keeping away the lithyar, and so robbed H. of his empire. All the stories told of the hero point to the fact that he was strong from his birth, and under the protection of Zeus and Athena he escaped the dangers prepared for him by Hera, e.g. he strangled two serpents sent to destroy him in his cradle. As he grew up, he received instruction in music, wrestling, archery, etc., but happening one day to kill Linus who tought him the lyre, he was sent by his rather imphitryon to tend his cattle. While thus employed, he made further exhibition of his strength by killing a huge lion which haunted Mt. Citharon, and did great damage both to his father's flocks and to those of the king of Thespise. His next adventure occurred on his way back to Thebes, when he met the envoys of Erginus going to demand their ann. tribute of 100 oxen from the Thebans. Cutting off the noses and expensions. of the envoys, he sent them back to Erginus, who immediately made war on Thebes; but II. defeated and killed Erginus, and was rewarded by the king of Thebes with the hund of his daughter Megara. Soon after this he is said to Megara. have paid a visit to Delphi to consult the oracle, and being told by the Pythian to serve Eurystheus for twelve years, went to Tiryus and carried out the injunctions laid upon him. He strangled the Nemean lion, fought the Lernman hydra, captured the Arcadian stag, hunted the Eryman-thian boar, cleansed the stables of Augens, king of Elis, destroyed the Stymphalian birds, captured the Crotan bull, captured and subdued the mares of the Thracian Diomedes, seized the girdle of the queen of the Amazons, captured the oxen of Geryon in Erythia, tetched the golden apples of the Hesperides, and brought Cerberus from the lower world. When he had performed these twelve labours, he returned to Thebes, where he sought lole, the daughter of Eurytus in marriage, but having in a fit of madnoss slain his friend Iphitus (the son of Eurytus), he was commanded by the oracle to serve three years for wages and give his earnings to Eurytus, and so entered the service of Omphale, queen of Lydia. After this he sailed

and helped the gods in their fight against the giants. He also proceeded against Pylos and Lacedemon, and then journeyed to Calydon, where he married Delanira, after fighting with Achelous for her. subsequently he settled at Tractus and narchod against Eurytus, whom he killed, and carried off Iole as prisoner. This caused Dejanira to be jealous, so she sent a shirt to her husband steeped in the blood of Nessua the centaur, hoping to restore had been poisoned by the arrow with which H. had shot Nessus; and so as soon as H. put on the garment the poison entered his body and caused him extreme He tried to tear off the shirt, but agony. was unable to do so, and was brought to Tractus in a dying state. When Deianira saw what she had done, she hanged horolf; and H. seeing no remedy for his misortune, placed himself on a funeral pyre on Mt. Ceta, and ordered it to be set pyre on Mt. Eta, and ordered it to be set on fire. When it was burning, a cloud came from heaven, and carried hm to Olympus, where he became a god and married Hobe. Sophocles's Trachinics give some account of H. and Deianira. Eurpides wrote two plays on H.—Mail Heracles, in which H., driven mad through the machinations of Hera, murders his children and wife; and Heracles, in which Theseus comes to the recue of H. in his fall (on these see G. Murray, Euripides and his Age, 1913).

Heroules, Pillars of (Herculus Columna), name given to the twin rocks (Lalpe (in the N.) and Abyla (on the opposite coast).

\.) and Abyla (on the opposite coast). which guard the entrance to the Meditertanean at the E. extremity of the Straits of Gibraltar. According to Pliny and Strabo, Hercules tore asunder the rocks which had before entirely divided the Mediterranean Sea from the ocean. Another legend asserts that he forced the two rocks into temporary union to make a bridge for the safe conveyance of the herds of Geryon to Libya, and another that he narrowed the strait so as to shut out the their way in from the occun and infested

the Mediterranean.

Hercules-beetle, popular name of Dynales hercules, a species of lamellicorn Coleoptera, belonging to the family carabuidie; they inhabit tropical Amera t, and the male meet is remarkable for the possession of a pair of large unequal norns, resembling pincers. Son male beetles reach a size of 6 in. Some of the

Heroules' Club, or Aralia spinosa, pecies of Arabacea, found in the W. Indies. The tree is closely allied to A. transeng, from which the drug ginseng is

obtained.

Hercynian Forest, name used in anct. times to signify the wooded nit. region N. of the lower and middle Danube, and ounetimes to include the whole region from the Black Forest to the Sudetes. Later, it became a general designation for the entire wooded, mt. ranges of middle Germany from the Rhine to the Car-pathian Mts. Herezeg, Francis, Hungarian author, b. in 1863 in S. Hungary. Descended from a long line of Gers. settled in the dist. called the Bacska, and his father was mayor of a tn. there. He is recognised as one of the masters of Hungarian literary style. His historical romanoe, The Pagans (1901), dealing with the conversion of the unbelievers in the eleventh century, and The Gate of Lije (1919), a study of Hungary in Renaissance times, are his best works. See J. Horvith, Herczeg Ferenc, 1925; M. Rubiny, Herczeg Ferenc, 1926; J. Gassner, Masters of the Drama, 1940.

Herd, David (1732-1810), Scottish author, b. in Marykirk, Kincardineshire. He spent most of his time in Edinburgh, and was president of the Cape Club, a literary association which had many dis-tinguished members. He is praised both by Scott and Archibald Constable. who acknowledges numerous obligations to him, but his fame rests on his pub. of Ancient and Modern Scottish Songs, Ancient and Modern Scottish Songs, Heroic Ballads, etc., collected from Memory, Tradition, and Ancient Authors (2 vols.,

1776).

Herdecke, tn. in the prov. of West-phalia, Germany, 16 m. S.S.E. of Dort-mund, on the Ruhr. It has considerable riv. trade and sandstone quarries.

6000.

Herder, Johann Gottfried von (1744-1803), Ger. critic and poet, b. at Mohrun-gen in E. Prussia. He was educated at the grammar school of his native tn. and at the univ. of Konigsberg, where he met Kant and Hamann. At an early age he began to write verses, and his first pub. works were occasional poems and reviews contributed to the Koniysbergische Zeitung. In 1761 he became a teacher at the cathedral school at Riga, and a few years later assistant pastor, and in 1767 pub. Fragmente über die neuere deutsche Literatur, in which he maintains that the truest poetry is the poetry of the people, and ridicules the ambition of Ger. writers to be classic. In 1769 he went to Strasburg, where he met Goethe, and in 1771 became court preacher at Buckburg. During this period he became one of the leaders of the new 'Sturm und Drang' movement, and pub. a jour, with others including Goethe, to diffuse the new ideas. In 1776 Goethe, to diffuse the new ideas. In 1776 he became court preacher at Weinnar, and while in this city pub. Stimmen der Völker in Liedern, an admirable collection of folksongs (1778-79); a celebrated work on Heb. poetry. Vom Geist der hebräischen Poesie (1782-83, trans. 1833), and his masterpiece, Ideen zur Philosophie der Geschichte der Menschiett (1781-91, trans. 1880). Which props II. to he an evolu-1880), which proves H. to be an evolu-tionist after the manner of Leibnitz.

the centre of an agric, and coffee-growing dist. Pop. (prov.) 55,100; (town) 10,500. Heredia, José Maria de (1842–1905), Fr.

poet, b. near Santiago de (1842-1903), Fr. poet, b. near Santiago de Cuba of a Fr. mother and claiming descent from the old conquistadores, he migrated to France at an early age. He was educated at Soulis and Havana, but finally went to the Ecole des Chartes in Paris, and made france his home. He was a member of the new school known as Parnassiens, who regarded form as being of supreme importance, and his poems, Les Trophées, pub. in 1893, and composed almost entirely of exquisitely fashioned almost entirely of exquisitely fashioned sonnets, prove him to have been a powerful word artist, as well us a master of the art of verse. If somewhat cold in their formal beauty, the craftsmanship of the Trophées is such as to rank H. among the foremost sonnet writers, not only of France, but of the world. In 1894 he was elected to the Academy, and in 1901 became librarian of the Bibliotheque de Parsénal at Paris. His other works are a trans. of Diaz del Castillo's History of the Conquest of New Spain (1878-81); and a trans, of the life of the nun Alferez (1894), or De Quincey's Spainish Military or De Quincey's Spainish Military. (1894), or De Quincey's Spanish Military Aun.

Hereditaments, term in Eng. law, meaning property which, unless devised by will or disposed of by the owner in his lifetime must descend to his heir (q.r.). II, are practically synonymous with land, and are divided into corporeal, i.e. interests in land in possession, or which confer the present right to enjoy the land either personally or through tenants, and incorporeal, i.e. rights subsisting in or over lands in the possession of another, such as reversionary and contingent interests (see REMAINDERMEN, REVERSIONERS), or rights of way, or other cascinents. The term also includes heirlooms, and such turniture or chattels as by custom descend to the heir and not as personalty. See also INHERITANCE.

Heredity may be defined as the genetic relationship between parent and offspring. Though the study of H. as a science was known to the Gks., and Hippocrates in the fifth century pub. a theory of H., no great progress was made until the end of the nineteenth century. Its practical importance to human beings, both in their personal lives and in plant and animal breeding has led to considerable interest in H., and to the collection of a large number of observations requiring careful examination and confirmation before they can be adduced as scientific evidence in support of any theory of H. Such familiar expressions as 'Like begets like 'and 'A chip of the old block 'show that the inheritance of similar characteristics has tionist after the manner of Leibnitz. Other works of his are: Kritische Walder (1769), Planik (1778), and Über den Ursprung der Sprache (1772), a work on language. His books have been cd. by B. Suphan (1877-87). See R. Haym, Herder nach Leben und Werken, 1877-85; H. Nevinson, Herder and his Times, 1884. Heredia, in. and cap. of the prov. of H., Costa Rica, 5 m. W. of San José. It is well situated (altitude 3786 ft.), and is

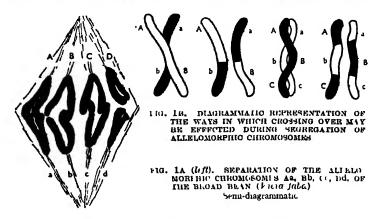

resulting in the production of a new organism. Amongst higher animals and organism. Amongst higher animais and plants soxual reproduction is almost universal, and this consists in the union of two cells or gametes (Ok. γαμέτης, spouse), that of the female heing the egg cell or ovum, and of the male animal the spermatozoon. In flowering plants the male gamete is usually a nucleus, with a little accompanying extenders. little accompanying cytoplasm, formed in the pollen grain and conveyed by the pollen tube to the egg cell. Free swim ming male gametes of plants such as occur for instance in ferns and in mosses are termed spermatozoids. Both gametes are microscopic, and the male is usually very much smaller than the ovum, consisting mainly of nucleus with an almost negligible amount of cytoplesin. The female gamete has a nucleus, and in most cases a relatively large quantity of cytoplasm in which food may be stored. Owing to the deposition of food around or Owing to the deposition of tood around or to one side of the own, the eggs of oviparous animals are of appreciable size. Fortilisation consists in the union of the male and female gametes; the fertilised egg-cell is the beginning of the next generation, and contains all the potentialities of the new individual. Unless fertilisation has taken place, the own is small attached to adopt the adult of the adult usually unable to develop into the adult

organism.
The ries lity.—Lamarck (1809) formulated some taws of inheritance and stressed the importance of the transmission of useful characteristics. He claimed that useful variations were more likely to be inherited than useless ones, and, according to his theory, useful characteristics acquired during the lifetime of an organism could be transmitted to offspring. The possibility of the inheritance of such 'acquired' characteristics will be discussed later. Darwin accepted Lamarck's theory, and suggested that inheritance was effected by nangenesis—that is, by the accumulation in the germ cells of pangens, small particles of each of the different types of body cells. Thus body cells modified by the environment could sond particles to the germ cells and the modification would be transmitted. formulated some taws of inheritance and the modification would be transmitted. The germ cells of human beings would, on this hy pothesis, contain particles from kidneys, liver and every discestive organ, hair, eyes, bones, lungs, various nurceles, and every different kind of body cell, so that the number of particles to be included renders the theory highly improbable, and the uncring passage of these particles to the germ cells presents further difficulty. Weismann seems to have been the first biologist to consider experimental evidence essential to the foundation of a theory of II., and, in 1888, as a result of his observations on the embryology of some of the higher animals, the modification would be transmitted.

terata, and in many plants, Weismann believed that a small amount of germ plasm accompanied at least some of the body cells. In this way he accounted for asexual reproduction and for the inheritance of a somatic modification by, for example, a plant propagated by a cutting from the modified part. Except in so far a all cells are pitimately derived from the as all cells are ultimately derived from the div. of a single cell and so retain indirect continuity, there is little evidence that the germ cells of most plants or of many the germ cells of most plants or or many animals are directly continuous from generation to generation. Moreover, re-cent research has shown that body cells not too highly differentiated may become dedifferentiated and function as germ cells, so that there is no absolute distinction between body- and germ-plasm. Weismann made a greater contribution to the study of H. by his theory that the nuclear chromatin was composed of minute particles, the determinants, each of which was responsible for the production of a characteristic of the individual. The nucleus (q.v.) is now generally recognised as playing a very important role in H., and the theory of the nucleus as the physical mechanism of transmission of physical mechanism of transmission of hereditary characteristics is based on a large number of observations of H. in plants and animals. A few of the main arguments in support of the theory are given here. (1) The nucleus of any given species of plant or animal consists of a constant number of chromosomes (see CELL). Although these appear in nuclear div. and atterwards apparently lose their identity when the nuclei are reconstituted, as soon as div. is about to occur again, the same number of chromosomes is formed. Very occasionally the number may be changed by the loss or addition of a chromosome owing to irregularities in div., chromosome owing to irregulatities in div., but such a change is accompanied by a change in the characteristics of the organism. Moreover, many of these chromosomes have a distinctive form: 0, X, J, and V shaped chromosomes are common, and reappear again and again in subsequent divs. There is therefore reason to believe that the chromosomes retain their believe that the chromosomes retain their identity throughout the natural nuclear phases. (2) The number of chromosomes, though large in some species of plants and animals, is always less than the number of characteristics possessed by an organ-ism. Consequently, if the nucleus be the mechanism for the transmission, each chromosome must bear the determinants probable, and the unerring passage of these particles to the germ cells present in any single chromosome will be transfurther difficulty. Wesmann seems to have been the first biologist to consider experimental evidence essential to the foundation of a theory of II., and, in 1888, as a result of his observations on the embryology of some of the higher animals, strongly dealed the inheritance of action characteristics. In the animals he investigated, he discovered that the germ cells, i.e. the coils eventually giving reducing 'nuclear div. takes place, so rise to gametes, were absolutely distinct from the body cells and were continuous characteristics. In the lower animals, the Protozoa and Coelenof sev. characteristics, and all those present

doubling during every fertilisation; secondly, it provides a mechanism for the secondly, it provides a mechanism for the assortment of groups of churacteristics, and thirdly, for the segregation, demonstrated experimentally by Mendel, of alternative characteristics (see Mendel, of alternative characteristics (see Mendel, This segregation will be discussed in the following section on types of inheritance. For the explanation of the assortment, we must consider the reducing div. When this is about to occur, the chromosomes arrange themselves in pairs and one member of each pair passes into the

the diploid number. The significance in less cytopiasm than the egg cell, it was H. of this reducing div. is threefold, first considered that the cytoplasm could first, by means of it the number of play no part in the determination of chromosomes, and inferentially of characteristics. Experiments in which teristics, is kept constant invited of development of an enucleated egg cell has depulsive development of an enucleated egg cell has characteristics. Experiments in which development of an enucleated egg cell has been initiated by the entry of a spern have, however, resulted in the production of larvar resembling the mother, and consequently the influence of the cytoplasm cannot be disregarded. It has been suggested that before or during the enucleation some emanations from nucleus into evtoplasm took place, but this has not been proved. Objections to the nuclear theory also occur in connection with the inheritance of sex. Morgan and Bridges were led by breeding experiments with the vinegar fly, Drosophila, to expect a

daughter nuclei. If we consider only two pairs (Figs. 1A, 1B) Aa and bB, A passes into one daughter nucleus, a to the other; A may pass into the same nucleus as B or as b and in this way may arise differences between gametes of the same If we consider only two parent. When sev. Chromosomes are present, it is clear that a very great number of different combinations may occur added by 'crossing over' between parts of allelomorphic chromosomes, as represented in Fig. 1B. The thromosomes of a pair are alternative or allelomorphic. There is considerable experimental (vidence to form a basis for the view that the allelomorphs are derived one from each parent and bear determinants of the same characteristic. For instance if a chromosome bear the determinant for eve colour, its allelomorph will also bear a determinant for eye colour, but not necessarily for the same one. This will be demonstrated in the discussion of experimental work. Although for these and other reasons the pucieus provides an admirable mechanism for the transn soion of hereditary characteristics, it cannot in all cases be regarded as the sole mechanism. Since inheritance

difference in the chromosomes of the male and temale, and examination of the nuclei showed two similar chromosomes, subsequently termed A-chromosomes, in the female. In the male the allelomorph of the X-chromes mes was a chromosome of different form, the V-chromosome. The other pairs of chromosomes of both soxes were similar, and distinguished as 'autosomes,' from the X and Y, or sex chromosomes, sev. other animals have been tound to possess sev chromosomes, though the numbers of these vary, and the male may have more or fewer than the temale or may have the same number. Most or may have the same number one sex investigators believe man to have one sex chromosome and woman two. The females of some species of insects have two equal sox chromosomes and the main two unequal ones, and by other species the reverse is the case. It has, however, recently been shown that an insect may have the chromosome constitution of a formals or of a male and yet be an intersex or even of the reverse sex. In some cases hormones (q.v.) are assumed to effect complete or partial sex reversal; in a choracter of different as the sole mechanism. Since inheritance others, the sex chromosomes of different from both parents is approximately equal parents have been shown to have different and the male gamete has usually much values, so that in some combinations as chromosome that should determine maleness, for example, is feebler than its allelomorph, an intersex or female resulting according to the difference in influence exerted by the two chromosomes. Thus exerted by the two chromosomes. Thus the presence of the sex chromosomes is bred true. The yellow-second plants were insufficient in itself to determine the sex of the animal. On account of the circumstance of two kinds, One third of them produced in successive generations only the cytologom and of hormoners, the yellow seeds: the remainder produced the cytoplasm and of hormones, the nucleus cannot be regarded as the sole agent effecting the transmission of hereditary characteristics, but it undoubtedly plays a great part in H. Morgan introduced the conception of the gene as the physical

yellow seeds: the remainder produced plants of both kinds. The plants breeding true were described as pure or homozygous for seed colour; the others were impure or heterozygous, and contained the determinants of both colour. From determinant of a characteristic. He con-siders that paired elements, the genes, linked together in a number of groups, thou of the determinants took place, so

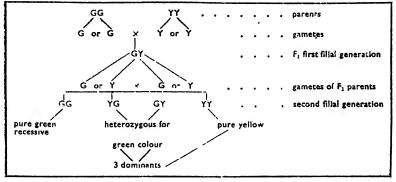

FIG. 2

Diagram showing results of Mendel's experiments in hydridisation with pure sicen and yellow seeded plants of the common field pea-

determine the characteristics of an organ-A single characteristic may be due to the interaction of a number of genes which are to be regarded as biological elements. Morgan's theory is based on two types of experimental work, the genetic results obtained by breeding many generations of Drosophila under carefully controlled conditions, and the cytological examination of germ cells of these insects.

Types of Inheritance .- Since the current Types of finarrance.—Since the current theories of finare based on the results of experimental work, it is necessary to mention briefly the nature of this work. Johann Gregor Mendel, of Bruun, seems to have been the first investigator to consider experiments according to the constitution of the constituti consider quantitative experiments neces-sary in the study of H., and in 1866 pub. the results of his experiments in hybridisation (see MENDEL). He selected wellmarked, easily recognisable differentiating characteristics of the field pea for observation, and collected results separately for

that a gamete contained the determinant on only one of a par of sitemative characteristics, i.e. one allelomorph only could be present. This soften called Mendel's law of the purity of the gametes. After fertilisation, the two allelomorphs, one from each gamete, came together and were segregated again before the new cametes were formed. Thus if G, Y (Fig. 2) be the determinants of green and yellow 2) so the accommunits of green and yellow colour respectively, a pure green-secded plant would have allele morphs G.G; a pure yellow-seeded. Y, Y, and a hybrid plant G.Y. The genetic would contain either G or Y, but not both. If the purents selected for the hybridisation experiments were pure green and pure yellow, the table in Fig. 2 would represent the results. the results.

Thus the probability of the production of a pure yellow or of a pure green seeded parent is one in four. The yellow colour is said to be dominant and the green recessive. In all cases studied by each pair of characteristics chosen. For recessive. In all cases studied by example, Mendel crossed tiowers of plants it is seeded plants. All the offspring, constituting the first fillal or F, generation, produced yellow seeds. When such plants were intercrossed, some of their quently described as Mendelian, and was quent experiments have shown that complete dominance is not an essential of Mendelian inheritance. The offspring of black Andalusian birds crossed with splashed white ones are blue, and these complete dominance is not an escontial of explanation of results. In any species Mendelian inheritance. The offspring of black Andalusian birds crossed with splashed white ones are blue, and these blue Andalusians, intercrossed, produce the mately equal numbers, so that the sex blue Andalusians, intercrossed, produce ratio, i.e. the ratio of males to females, black, blue, and splashed white birds is 1:1. The transmission of certain

independently discovered by Bateson, tion, and the 'Presence and Absence' Correns, and de Vries thirty-four years hypothesis has been almost completely after the pub. of Mendel's results. Subsequently abandoned, being retained in only very abandoned, being retained in only very few cases where it provides the simplest

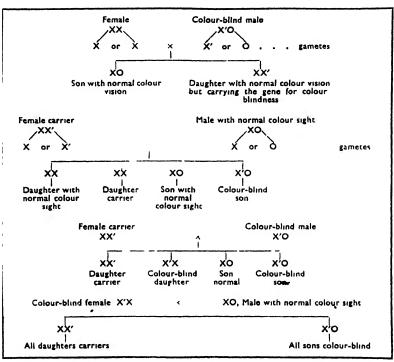

FIG. 3. DIAGRAM SHOWING INHERITANCE OF SEX-LINKED CHARACTERISTICS

respectively in the Mendeliau ratio 1:2:1 Thus the two allelomorphs, the genes for black and white, interact, producing an intermediate characteristic, 'blue.' The assumption that complete dominance was assumption that complete dominance was essential led to the explanation of Mendelian inheritance by the 'Presence and Absence' hypothesis. According to this dominance is due to the presence of the genes determining a characteristic, whereas the recessive (ondition is due to their absence. In the experiment with Anda-lusian fowls, however, the colour of the hybrids can be explained only on the assumption that the presence of a deter-minant of the recessive characteristic has modified that of the dominant one. Sev. other experiments support this assump-

characteristics is associated with the sex of the parent, and these are termed sex-linked characteristics. The best-known examples of these in man blindness and hemophilia. man are colour-lia. The sons of a colour-blind woman and a man with normal colour vision are all colour-blind; the daughters all have normal colour vision, but carry the gene for colour-blindness as a recessive. If one of these bilindness as a recessive. If one of these daughters marries a colour-blind man, half the sons and half the daughters will be colour-blind, but if the father has normal colour vision, half the sons will be colour-blind and half the daughters will carry the gone for colour-blindness. This and similar phenomena of sex-linkage may be explained by supposing that the sex

chromosomes carry other genes in need special statistical treatment. Galton addition to those determining the sex of funded this biometrical study, and Pearthe to organism. If XX (Fig. 3) represent son and Weldon have been its leading the two sex chromosomes of woman, each exponents. There are only three possings cell will contain a single X; and if X better the contain the sex of the contain either X or O. If X represent the sex chromosomes are a sext. If X' represent the sex chromosome carrying the gene for colour-blindness, the table will show at a glance the mode of inherit-

From this it is obvious that sex-linked characteristics are not inherited in the Mendellan ratio. Similarly the ratio cannot hold for groups of characteristics determined by any other single chromosome. In any case, however, it must be remembered that the ratios given by theory may be disturbed or never be realised for all the care of the calls realised, for all the egg cells and sperms do not unite at the same time, so that, for instance, those spermatzoa with the X-chromosome might never succeed in fertilising an egg cell, and all the children would then be sons. However, when large numbers of individuals are constanted the results work out according to sidered, the results work out according to the law of probability, and then the Mondelian ratio, the sex ratio, and other ratios deduced theoretically from a knowledge of the genetic constitution, are realised. Mondel himself investigated over one thousand plants, and other inover one thousand plants, and other investigators have sinc, worked with tens of thousands. Another phenomenon disturbing the theoretical ratio is that of 'crossing over.' This is a phenomenon in which the linkage of genes is broken and an exchange takes place between allelomorphic groups of genes. The diagrams show how this may be effected during the soparation of allelomorphic chromosomes very closely associated chromosomes very closely before segregation takes place. associated

Variation.-Variation must be mentioned here, for evolution is dependent on the inheritance of variations. In a discussion of variation and H. the following questions arise for consideration. What is inherited? Are variations themselves transmissible, or is the power to vary inherent and the actual variation due to environment? For an account of modes of variation, see Variation. Darwin believed continuous variations were inherited and eventually gave rise to new species. This theory, however, awaits biometrical proof, for the process is so slow that it is practically impossible to obtain experimental proof. Discontinuous variations occur in nature, and undoubtedly give rise to new species, but their cause is unknown. The transmission of mutations places the doctrine of common descent on a much firmer foundation than it could otherwise hold. The inheritance of modifications due to the environment is still a disputed question, but what indisputably is transmitted

characteristic, viz. two pure types and the hybrid, though attempts have been made from time to time, with but little success, to classify kinds of inheritance. Notwithstanding this, it is possible to determine arrange degrees of resemblance between parent and offspring. The usual elementary example of this is the relation between statures of sons and fathers, and in this a smoothed graph is drawn, which in this a smoothed graph is drawn, which shows the mean statures of sons from fathers of varying but classified heights: e.g. Pearson and Lee after an investigation of some thousands of individuals dis-covered that the average height of son-

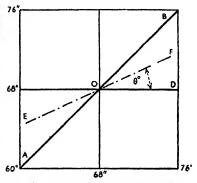

DIAGRAM SHOWING DEGREE OF RESEMBLANCE BETWEEN STATURES OF FATHERS AND SONS

Vertical, son's stature; horizontal, father's statute Tan θ = coefficient of correlation

from a group of 62-in, fathers was 65\frac{1}{2}-in.; from 65-in, fathers the sons' average was 67 in.; 68-in, fathers, 69-in, sons: 71-in, sons. Intermediate values were also determined. Now if the sons' statures be plotted on squared paper as vertical heights, and the corresponding fathers' statures be plotted as horizontal distances (see simplified distances (see simplied distances (see simplified distances (see simplified dist distances (see simplified diagram, Fig. 4), it is possible to draw a graph indicating the degree of inheritance which exists between father and son relative to stature. If the resulting graph had been a horizon-tal line as CD, it would have shown that all classes of fathers had about the same average-height son, i.e. the inheritance would have been zero. If the graph were inclined at 45° to the horizontal, as in the case of AB, it would show that each class of tother would the desired to the case of the case of the case of the case to the case to the case of the case of the case to tion, but what indisputably is transmitted is the power to vary, and it seems probable that organisms possessing this in a high degree will readily react to their environment and begin to vary early in life.

Statistical study.—Not only is H. studied by the experimental method, but important branches of the subject also lies between the horizontal and the 45°

line as, say, EF, and the steepness of this line is a measure of correlation existing between the two statutes. The actual coefficient of correlation is expressed as the tangent of the angle FOD, and in this simple graphical method is not of absolutely general application, as it assumes that variation is normal and similar in parents and offspring, and it also assumes that the graph EOF is linear; any marked bend in it would demand complicated methods of treatment. Pearson has determined a large number of such plicated methods of treatment. Preason has determined a large number of such coefficients between father and son, e.g. stature 0.51; span 0.46, forcarm 0.42, eye colour 0.50; and has suggested 0.48 as a mean value, i.e. on the average the offspring deviate from the mean about half as much as the parent does. If the second parent be also considered, the coefficient increases, though it does not equal unity. It should be remembered that statistical methods are supplementary to experimental methods, and that they apply only to populations in the mass. The co-efficient of H. does not enable the investigator to determine what will occur in any particular case, as, for example, the son of a 6-ft. father may be anything within the whole range of statanything within the whole range or statures, yet in those cases of II., too complex for Mendelian analysis, the statistical method has proved of great value. The Law of Ancestral Heredity, formulated as a result of statistical methods, is of considerable interest. Galton calculated that, on the average, half of the H. of an individual may be taken as derived from individual may be taken as derived from the two parents, one quarter from the four grandparents, and so on in the series 0.50, 0.25, 0.125, etc. Pearson has more recently given 0.6244, 0.1938, 0.0630 as the series, thus laying more stress on the parental bequest and less on the ancestral. Harris has found that there is a correlation between stature and length of leg, but no constant relation between stature and arm length, and other recent work includes the blometrical study of the inheritance of feeblenindedness by Goldard.

Disputed Questions.—One of the most vexed questions in H. is that of the francial study of the francial control of the francial contr

mission of the acquired characteristics, and some of the differences of opinion with regard to this are due to boscness of definition. According to Lamarck's theory, a modification produced during the lifetime of an organism as a result of the influence of the environment was transmitted to offspring. An acquired characteristic may therefore be defined as one—not previously known to have appeared spontaneously in the ancestry of the individual—appearing as the result of the action of the environment and persisting after the removal of the factors inducing it. Since a recessive characteristic cannot appear unless both parents bear the gene for it, sev. generations may pass before the characteristic is revealed. Other characteristics may remain latent for many generations in an unfavourable

line as, say, EF, and the steepness of this might easily be regarded as new if the line is a measure of correlation existing genetic constitution of the organism be incompletely known. Both recessive and latent characteristics are inherent in the germ cells. If the offspring be subjected to the environment inducing the change in the parent, they might equally well acquire the same modification, and some of the results adduced as undoubted inheritance of acquired characteristics may quite well be due to direct influence of environment on the offspring. Nunerous experiments have been carried out in an endeavour to discover whether acquired characteristics are transmitted, but in most cases the pedigree of the out in most cases the pengree of the animal experimented upon has been in-sufficiently known. Other experiments have not been carried out under really critical conditions and others have not been extended through a large enough number of generations to justify the conclusions drawn from them. The earlier experiments were concerned mostly with mutilations. Weismann and other investigators who cut off the tails of many generations of mice found the tails of the progeny unaffected by the experiment. Some of the most extensive experiments on mutilations were carried out on guineapigs by Brown-Sequard and his assistants. but the experiments do not warrant a definite conclusion, for they involved injury to the nerves of a parent. Many of the offspring were abnormal, but extremely few were affected in the same way as the purent, so that it seems that way as the purcht, so that it seems that a new characteristic appeared, instead of the acquired one being transmitted. Moreover, in many of the experiments there was insufficient evidence to show that the abnormalities were inherent; in all cases the greatin history was not known for a sufficiently large number of canonicians. A sufficiently large number of generations. A well-controlled scientific series of experiments was carried out by Hestop Harrison and Garrett, on three spoces of moths. By feeding these on food impregnuted with lead nitrate or with manganese sulphate, sooner or later a for black moths appeared. No black moths of these species had previously been recorded as occurring naturally. In breeding, the Mendellan ratio was ob-tained, the black pigment behaving as a recessive in two species, and as a dominant in the third, as far as the experiments went, but the third set was incomplete. Since the black colour did not appear in the parent, this cannot be considered as all example of inheritance of acquired characteristics in the Lamarckian sense of the term. A perminal change, however, must have been effected and transmitted, and some motern hologists would regard this a an example of transmission of acquired characteristics. This experiacquired characteristics. This experi-ment affords striking evidence against Weismann's theory that the germ-plasm could not be affected by the body-plasm. Kammerer's experiments on the colour change of salumanders in a changed environment and on the breeding of the midwife tond, Alvtos, in wet and dry habitaty, led him to believe that acquired environment, but neither recessive nor inidwife tond, Alvies, in wet and dry latent characteristics, when they eventually appear, are acquired, although both characteristics were transmitted, but the

experiments require confirmation. Sumner's work on the effect of temp. on mice suggests positive results; Castle's experinuggras positive results; Castle's experi-ments on guinea-pigs give direct negative results. Consequently at the present time experimental work has not yet yielded conclusive evidence in favour of the inheritance of acquired characteristics as such, but Heslop Harrison and Gar-rett's results show that environment may, through the body-plasm, act on the germ-plasm, and that germinal modifications so acquired are transmissible. On the other hand, it is difficult to account for evolution, if acquired characteristics are not inherited. The indirect evidence of paleontology is considerable, and seems to indicate that such inheritance must have occurred. Another disputed question, already discussed under theories of H., is that of the rôle of the nucleus as a mechanism for the transmission of characteristics. and of other agencies such as the cytoplasm and hormones, alding or modifying inheritance. Sex inheritance also has caused much controversy, partly on account of the apparently conflicting results count of the apparently conflicting results of different experiments, and partly because of its connection with sex determination. If sex chromosomes be the solo determinants, then the sex of the organism is determined at fertilisation, and cannot be changed. If the action of hormones, the sex termines, be able to reverse sex, it is conselvable that, whatever the nuclear constitution may be, with increased knowledge sex may in the future increased knowledge sex may in the future be determined at the will of the parents some scientists think that sex deter-Some scientists think that sex deter-mination may depend on the nutrition of the parents, but there is no conclusive evidence to support this theory. Tele-gony and maternal impression (see BREEDING) are not accepted by most scientists, but tradition dies hard amongst cattle-breeders, and so belief in these theories is still fairly widespread. Practical breeding.—One of the most

valuable applications of Mendelism is the fixing of pure types. A thorough and systematic search for the best pure lines is one of the best methods of improving these economic plants which are self-fertilised, and Nilsson and his assistants have done valuable work in Sweden in isolating the best pure varieties from the mixtures of numerous types existing in that country. In the case of the maize experiments by shull and East, a definite increase in vigour has followed systematic p. Prof. Biffen has produced which combines the valuable features of one race with the immunity to rust type. of another otherwise less valuable Careful selection in sugar-beet has resulted in an increase of sugar percentage from 8 to 17. More difficulty is experi noed with regard to animal breeding, and enced with regard to animal breeding, and theory at present does little else than give reasons for principles already discovered, such as vareful selection and the 'balancing of defects.' Inbreeding 'to ix type has been a long-estab, practice and 'outbreeding' to seeme vigour is its well-known companion rule. The matter becomes still more difficult when the

principles have to be applied to mankind. The small numbers of progeny of mammals, the time taken for their development, and the large number of characteristics to be considered, make the study of animal breeding, and particularly of engenics, a very slow process. Eugenics described elsewhere, is the science which deals with the improvement of the inherent qualities of the human race, and although its principles are based on H. and are thoroughly sound, yet intellative schemes of positive eugenics are very difficult to introduce, but a beginning has been made in the U.S.A. and under the Nazi regime in Germany, for instance by the compulsory sterilisation of individuals suffering from incurable forms of insanity. As mentioned earlier, conclusions certainly appear to indicate that man is almost entirely the product of inborn factors which are not directly affected by environment, and many responsible students of H. maintain that the improvement of conditions is resulting in the propagation of the degenerate, and the race as a whole is suffering in consequence. Natural selection as such is out of the question, but some restriction on the reproduction of the unit is undoubtedly demanded by H.

demanded by II.

('yto-penetics.—One of the most encouraging recent lines of work has been the correlation of evtology (i.e. microscopic observations of the cell (y.e.) and especially of the (hromosomes) with breeding experiments, whereby a new branch of biology, cyto-genetics, has originated, and mutual support has been afforded to what seemed at first to be disconnected studies. The facts of sexinaked inheritaines, for instance, have been luked up with observations on the seventomosomes. See R. C. Punnett, Mendelism, 1905 (7th ed. 1927); C. B. Davenport, Body-build and its Inheritaines, 1923; R. E. Gates, Heredity and Eugenies, 1923, and Human Ancestry, 1917; E. M. East, Heredity and Human 11/hurs, 1927; T. H. Hereford, Earl of. This title dates from feudal times, the first holder of it probably being Wm. Fitzosbern, who led the right wing of the Conqueror's army at Hastings. The earldom was long held by the great tamily of Bohun. Before their day it was held by sev. Norman barons (besides Fitzosbern), one of whom left a daughter who married Humphrey Bohun, 'their son, Henry de Bohun, received the title in 1199. Among his descendants may be mentioned Humphrey, fourth earl of H. (1275–1322), who was taken prisoner at Bannockburn. In 1380 the heiress of the earldoms of Hereford, Essex, and Northampton, May de Bohun, married Henry Bolingbroke, who was made duke of Hereford in 1397. The

first viscount was Walter Dovereux (d.) 1558), who received the title in 1550 for his services in the Fr. wars; the second was the first earl of Essex, the father of Elizabeth's favourite; the third, Robert, was the distinguished general in the parlarmy. The present holder of the title is the second with the second of th the seventeenth viscount (b. 1865) eldest

troyed in 1055 by the Welsh, was rebuilt late in the eleventh century, the nave and other Norman parts of the building being completed in about 1140. The beautiful early Eng. Lady Chapel was built in about 1220 and other portions were not completed until the early fifteenth century. In 1786 the Norman W. tower collapsed, bringing down with it two bays of the nave, and its rebuilding was entrusted to Wyatt. He built a W. front so unsuitable that it had later to be replaced, shortened the nave by one troyed in 1055 by the Welsh, was rebuilt the seventeenth viscount (c. 1993) eigest as of the sixteenth viscount, whom he succeeded in 1930. Viscount Hereford is the premier viscount of England.

Hereford, municipal bor, city and co. th. of Herefordshire, England, on the bo replaced, shortened the nave by one

HEREFORD CATHEDRAL FROM THE N.E., SHOWING THE EARLY ENGLISH LADY CHAPEL

R. Wye, 144 m. from London by rail-way. Its site was seized by the Mer-cians in about A.D. 600 and used as an outpost against the Welsh, and later Offa made the Wye the Welsh boundary at Hereford. On account of its position, The two most treasured possessions of the H. was an important place in the Middle Ages when it became a prosperous centre of the woollen trade. Early charters describe H. as being in Wales. The describe H. as being in wates. The city's first charter was received from Richard I. in 1189, but long before that it had a well-defined system of local gov. Rdward the Confessor made his nephew, Ralph, earl of Hereford, and this Norman and half it for the castle wilds.

character. The restoration in 1863 was from the designs of Sir Gilbert Scott. The two most treasured possessions of the cathedral are its Chained Library and the Mappa Mundi. The latter is dated about 1300, and, since the disappearance of the Nuremberg map, is probably the earliest map of its kind in existence. Jerusalem is seen to be at the centre of the world. Only two other chained libraries can compare with the one at H., which contains amongst its 1440 books, some very are manuscripts and early printed vols. Ralph, earl of Hereford, and this Norman carl built its first castle which, however, together with the cathedral, was destroyed in 1055 following a defeat by the Welsh. From that time until the city's Caronicle and the only surviving copy of Welsh. From that time until the city's the Use of Hereford are a few examples. Capture by the famous Col. Birch in 1645. H. was the scene of constant warfare, the castle finally being demolished in 1660.

The cathedral, founded not later than 680 by its first bishop, Putta, and desThe 'Three Choirs Festival' and 'Three Counties Show' are held in If. every third year. The city is also interesting as the bp. of David Garrick, and, it is claimed, of Neil Gwynne, and for its associations with Sarah Siddons and Fanny Kemble. The fine bridge over the Wye was built at the close of the fifteenth century and from it there is a well-known view of the cathedral. Chief manufs. are tiles and cider-making, fruit preserving and engineering. An airport was opened in 1947 on the H. Racc Course. preserving and engineering. An airport was opened in 1947 on the H. Race Course. Pop. (estimated) 30,500.

Hereford Breed, see under CATTLE.
Herefordshire, inland co. on the S.E.
border of Wales, bounded on the N. by
Shropshire, and on the S. by Gloncestershire and Monmouthshire. Its area is
843 so, mend its environs is undulating 843 sq. m. and its unface is undulating. The co. is watered by the Wye and its tribs., all of which abound in fish, the Wye being especially celebrated for its salmon. The soil is particularly suitable for the growth of timber, and the cak, ash, and larch abound, but the co. is especially famous for its emple and near tree. and larch abound, but the co. is especially famous for its apple and pear trees. It is also noted for its cattle of bright red hue, with mottled or white faces, which produce very fine beef. There are no minerals of economic importance, and but few manufs. Pop. 113,000. See H. L. V. Fletcher, Herefordshire, 1948.

Herefordshire Regiment. Formed in 1701 and number 43 56th knot. L'aked in

Herefordshire Regiment. Formed in 1701 and numbered 36th Foot. Licked in 1881 with 29th to form the present Worcestershire Regiment (q.v.). It gained the motto 'Firm' for its staunchness during active service in Bangalore, India, in 1791. The present H. R. is a territorial army unit, having descended from a volunteer unit formed in 1860. It served in the S. African War during 1900–1902 and raised four battalions during the First World War, which served in France and Flanders from 1914 to 1918. In the Second World War they fought in France.

Second World War they fought in France.
Herent, Belgian tn. in the prov. of

Africa (q.v.) where their descendants lived in the N.E. part of the present S.W. Africa (q.v.) where their descendants lived in the N.E. part of the present S.W. Africa (q.v.) where their descendants lived in the N.E. part of the N.E. part of the present S.W. Africa (q.v.) where their descendants lived in the N.E. part of the present S.W. Africa (q.v.) where their descendants lived in the N.E. part of the N.E. part grazing lands and pastureless fountains, did not serve the requirements of the Hs. with their ever-growing riches in cattle, and they trekked into the southerly veld and Otitambi became their religious and controlling centre. In 1750 the first big owners of cattle trekked S. over the Omaruru, drove away the Saan and Berg Damaras, were once more united with their brother tribe, the Ovambanderu, and eventually occupied all the country N. of the Swakop R. and eastwards to beyond Gobabis. Not all the Hs. left the Kackoveld, the Ovahluba-Hereros remaining in the N. as their grazing and watering places sufficed for their needs. They are poor classes, but by tradition, religion and language, they are pure Hs. and it is only the Ovamnos and Hs. who trekked S., who call them Ovatjimba. trekked S., who call them Ovatjimba, which means 'antbear.' The H. tribe were largely exterminated by the Gers. in 1903-04 in circumstances of deliberate and callous barbarism. Ger. misrulo, oppression and crueity goaded the Hottentots into rebellion in 1903 and shortly afterwards the Hs. rose too. The anct. enemies were united in misery. The Berg Damaras, through their association with the Hs., suffered equally in the slaughter which followed. The natives were no match for the trained Gers. with thoir modern weapons and by the close of 1904 it was evident that both the Namas and the Hs. were broken races. Scattered bands, however, held out and

the Gers. then sent thousands of troops into the ter. In the guerilla warfare which followed the first big engagements violence begat violence and the Ger. forces were spurred to fresh vengennce by tales of spurred to frosh vengennee by tales of mutilations of Ger, soldiers who fell into II. hands. Leutwein, regarded as too lenient, was replaced by von Trotha, noted in Berlin for the severity of his dealings with natives. Von Trotha trapped sev. of the II. leaders with reacherous enticements to peace talks and then issued his notorious Vernicht was Existed (extensionates ended). tungs Befell (exterintation order) under which no II.—man, woman or child—was to receive nicroy or quarter. The Ger-soldiers were ordered to kill and take no prisoners and you Trotha explained afterwards that he wished to ensure that never again would there be another H. re-bellion. The order was issued against an of the H. chiefs came into conflict with again would there be another H. rethe Bechuanas as the grazing lands of the bellion. The order was issued against an latter extended far into what was once known as Hereroland and a deciding battle took place at Etemba, N. of Okahandja. The Hs. were beaten and saved their eattle by trekking into the story of this typical Ger. sadism, based on the sworn descriptions of eye witnesses, molested for some two centuries (1650 to has been told in a bulky official report presented to the Brit. and S. African Parliaments (pub. by H.M.S.O., London, as Umd. 9146 of 1918). The war ended in 1907 with the H., Nama and Berg Damara tribes utterly broken and scattered to the winds, some taking refuge in adjoining Brit. ter. Eighty per cent. of the H. people had disappeared and more than half the Hottentots, while the Herg Damaras fared little better. The Hs, in 1904 numbered 80,000; in the official census of 1911 they numbered only 15130—a decrease of no fewer than

Heresy (Gk. a'peas), choice, a term in theology, signifying 'a choice of doctrine.' In the N.T. it is used with various meunings, in the Acts of the Apostles it is applied to the Pharisces and Sadducees. in the Epistles of St. Paul it is used to denote the divs. in the Christian church, and in St. Peter's Epistle the modern meaning 'falsely chosen' is first sug-gested in the words, 'Among you also there shall be false teachers, who shall privily bring in destructive heresies, donying even the master that bought them, etc. Again, it was used by Ignatius to etc. Again, it was used by ignatius to signify theological error, and as the doctrine became more important, it was restricted to views at variance with the recognised creed. Heresy, according to Thomas Aquinas, implies a profession of Christian belief; the heretic is right in the end he proposes to himself, but wrong in the means to that end. Even in apostolic times, Hs, existed in the church, and before the council of Nice there and before the council of Nice there existed many sects; but these earlier Hs. were chiefly concerned with the introduction of Jewish or pagan elements into the faith of the church, and were punishable by excommunication, etc., whereas the later Hs. were differences in interpreta-tion of Christian truth, and were regarded as legal offences, and punished accordingly. Constantine enacted sev. severe laws for the repression of H., which appear under the title 'De Hæreticis' in the Justinian code, and the penalty of death is even included among these, and in the Eng. law the offender was tried by the arch-bishop and his council, and then handed over to the king for punishment. But the statute of Henry IV. (In heretico comburendo) empowered the diocean to hand over the criminal to the sheriff without waiting for the king's writ. This statute remained in force until Charles IL's reign, after which time the punishment of heretics was left to the cocles.

Herward the Wake, outlaw, received his title of 'the Wake' from John of l'eterborough. According to the Domesday Book he was the owner of lands in Lincolnshire, and he may have been identical with the owner of Marston Jabbet, Warwickshire, and Evenlode, Worcestershire. He headed the rising of the Eng. at Ely in 1070, and plundered Peterborough with the help of the Danes. He was joined by Morkere, Saward Bain, and Æthelwine, Bishop of Durhum, and held out against William until 1071, when Æthelwine and Morkere surrendered. H. escaped, and

according to Gaimar, was pardoned by William, whom he accompanied to Maino, where he was murdered by the Normans. Herford, tn. on the Werre in Westphalia, Germany, 10 m. N.E. of Bielefedd it is of anct. origin and contains many old buildings, including a twelfth-century church. It carries on a considerable trade and manufs. tobacco, cloth, and furniture. Pop. 38,500.

Hergenrother, Joseph von (1824-90), Ger. theologian. He was author of Anti-Janus (1870), in which he defonded the doctrine of papal infallibility. The work made a great sensation, and he was made a prelate of the papal household in 1877, becoming a cardinal in 1879, and curator of the Vatican archives. He also wrote Photius, Patraurch con Konstantinopel (1867-69), Katholische Kirche und Christlicher Staut (a book on the relations of church and state, 1872), a universal church hist. (1876-80), and a hist. of the papal states since the Revolution. See monograph by J. Stamminger, 1892.

Hergesheimer, Joseph (b. 1880), Amer. novelist, b. at Philadelphia. He was educated at a Quaker School and the Pennsylvania-School of Fine Arts. Estab. himself

Hergesheimer, Joseph (b. 1880), Amer. novellst, b, at Philadelphia. He was educated at a Quaker School and the PennsylvaniaSchool of Fine Arts. Estab. himself as one of the best of the younger generation by his novol, Mountain Blood (1915), and enhanced his reputation still further with his Three Black Pennys (1917). His best novel is Java Head (1919). Other stories, The Bright Shaul (1922), The Presbyterian Child (1923), Fallsand (1924), Tampico (1926), and The Foolscap Rose (1927).

Hergest, Red Book of, name given to a MS of Welsh literature, which is now in the library of Jesus College, Oxford. It is a folio vol. of 360 leaves written in double columns from the beginning of the fourteenth century to the middle of the fifteenth century, and contains eleven tales, the stories of which mostly relate to King Arthur and the early Brit. kings. Lady Charlotte Guest printed those tales together with Hanes Taltessia under the title of Mabinogiam, 1838-49. The MS, is supposed to have been written at Hergest Court, a seat of the Vaughans, hence its name.

Heringsdorf, tn. on the is. of Usedom in Pomerania, Germany; it is a watering-place on the Baltic. Pop. 1700.

Heriot, curious archaic right (now obsolete) incident to copyhold tenure, by which the lord of the manor was entitled, on the death of a tenant, to seize his best beast or other chattel. A H. came in Saxon times to be really a tribute of warhorses, weapons, or armour due to the king on the death of a thane. These anct. Hs. were sub-sequently rendered obsolete by the institution of reliefs, or sums paid by a vassal on taking up his estate. The copyhold H. had a different though analogous origin and selated to sceape lands as opposed to those held by knight service. The origin of the right is to be sought in the anct, custem of a frechelder furnishing his tenants in villeluage with cattle and the implements of husbandry. The right of the lord to this kind of H. was restricted to such chattel as the

manorial customary law allowed, and that law varied in different manors

Heriot, George (1563-1624), Scottish goldsmith, b. in Edinburgh. He was brought up in the husiness of his father, who was a goldsmith, and in 1601 became joweller to James VI., having already been appointed in 1597 goldsmith to his queen, Anne of Denmark. In May 1603 he accompanied the king to London, and was one of the three mercurs appointed. one of the three persons appointed jewcliers to James 1. In 1620 a grant was made to him of the imposition on was made to him of the imposition on sugar for three years, and out of the proceeds he founded Heriot's hospital, Edinburgh (see Heriot-Wart College). It, is the 'Jingling Geordie' of Scott's Fortunes of Nigel.

Heriot-Watt College, Edinburgh, was subsidised from the fund (£23,625) left by George Heriot in 1624 to found and endow a bosoitist for the maintenage of the sons

a hospital for the maintenace of the sons of poor burgesses. This school was com-pleted in 1609, and in 1885 the funds had increased to such an extent that it was reconstituted as a middle-class school, and the H. W. C. was opened to provide a thorough scientific and technical instructhorough scientific and tocunical instruc-tion at moderate fees for older students. In 1927, by the provisions of the H.-W. C. and George Heriot's Trust Order Con-firmation Act, it became a college for providing technical, trade, commercial, and general ordine?! In for both sexes, and was recognised by the Scottlish Education Dept. as a Central Institute for Edinburgh and S.E. Scottland. Day and exemps and S.E. Scotland. Day and evening instruction is given in Mechanical, Electrical, Mining, and Oil Engineering, in Applied Chemistry, Brewing, Pharmacy, Building, and Frinting; while evening courses in Commerce and Lunguages are given to students of Accountancy, given to students of Accountancy, Banking, Insurance, Secretarial Practice, Stockbroking, and Shipping. The H.-W. Literary Society (founded 1868) celebrated its diamond jubilee in 1928. The lord provost of Edinburgh is chairman of the Governors of the H. W. C., and many notable men have received instruction in this institution.

this institution.

Heri Rud, or Hari Rud, riv. of Afghanistan, Asia, rises in the Kon-i-baha Mts. It flows W. for 300 m. to Herat, turns N. at Kushan, and is joined at Pui-i-Khatun by the Keshef Rud. At Sarakha it is called Tejend. It enters Turkestan and is lost in the Kara-Kum desert. It contains quantities of inch. Length 650 m.

Herisau, tn. in the canton of Appenzell, Septemberg, and of the Ausser-khoden.

Switzerland, cap. of the Ausser-Rhoden dist., 51 m. S.W. of St. Gall. It contains an old bell tower and th. hall, and the sulphur baths of Heinrichsbad are quite near. It manufs, couton goods and embroidery.

Pop. 15,090.
Heristal, see Herstral.
Heristal and Moveable, in Scots hw.
a fundamental distinction between legal rights and things, more or less parallel to the Rom. classification of things cor-poreal and incorporeal. The distinction poreal and incorporeal. The distinction is mainly of importance in respect of the rights of an heir as opposed to those of the executors or next of kin of a deceased person. The distinction does not neces- land, 1754.

sarily correspond to the physical distinc-tion between moveable and unmoveable property, although, generally speaking, all rights in or connected with land are herifable, and whatever can be moved without ante, and whatever can be moved without injury to itself or the property with which it is physically connected is moveable property. But, as in the Eng. law of fixtures (q.u.), things which are physically moveable may, in Scots law, become heritable by accession (Lat. access, to aid), and conversely, things in their nature beritable may be constructively converted into moveables by being made part of a move-able whole, as e.g. heritable things made able whole, as e.g. nertable things made part of the common property of a trading company. See J. Erskine, Principles of the Law of Scotland, 1754; G. J. Bell, Commentarius, 1810.

Heritable Jurisdictions, In Scotland

Heritable Jurisdictions. In Scotland all pursdictions were originally personal, i.e. granted in consideration of the fitness of the grantee, but when the fendal system was introduced certain jurisdictions, such as sheriffships, were annexed to lands and braune heritable, like the lands to which they were annexed. Later, when sheriffships ceased to be territorial, the crown made heritable grants of such jurisdiction to landowners. The Jurisdiction Act. of 1746. in consequence of the Jacobita 1746, in consequence of the Jacobite rebellion of 1745, abolished all H. J., compensated the persons who owned them,

and made jurisdictious personal to the king's courts. See J. Erskine, Principles of the Law of Scotland, 1754.

Heritable Security, or Securities on Heritable Estates, in Scots law, include all bonds, heritable and of annuity, instruments entitling a creditor to appropriate the rents of land until debts are paid, and all deeds whatsoever capable of constituting a security for debt over lands or the rents and profits of land, and since 1874 also securities by way of ground-annual (q.v.). The form of a H. S. is either by (1) a direct conveyance of the lands either subject to the right of redemp-tion or absolutely, or (2) by real or reserved. burden containing no disposition of the lands. A.H. S. is extinguished by formal redemption. See J. Erskine, Principles of the Law of Scotland, 1754.

Heritor, in Scots law formerly denoted the owner in fee of a corporal heritable subject or any par. landowner, but is a term now restricted to such landowners whose estates are subject to the burden of repairing the manse of an incumbent (q.v.), or of providing a church for newly churches as already exist. The term includes railway companies or other corporations and burgh councils, but not lifetenters, tenant, on long or short leases, or fen superiors. The question whether realrent or valued-rent lis. are to be assessed for repairs depends on the nature of the par, whether landward or burghal. Hs. may, however, do the repairs voluntarily, and assess themselves at a meeting in the presbytery or in the sheriff court, and they are entitled to borrow money for the purpose. See G. J. Bell, Commentarius; J. Erskine, Principles of the Law of Scot-

Herkimer, tn. and cap. of H. co., New York, U.S.A., on the Mohawk R. It manufs. paper, furniture, and woollen goods, and is the centre of a dist. famous for its cheeses. Pop. 10,500.

Herkomer, Sir Hubert von (1849-1914), Brit. painter, b. at Waal, in Bavaria; gon of Lorenz H., master-joiner. His parents took him to America when he was aged two: ufter six years there, they came to England. He first studied at the School of Art at Southampton, but in 1866 went to S. Kensington. He exhibited at the Royal Academy in 1869, but made his reputation in 1875 by 'The Last Muster, hung that year. A.R.A., 1879; R.A., 1890; Slade prof. of fine arts at Oxford, 1885-94. In 1883 he founded the Herkomer School of Art at Bushey, which he directed until 1904. In 1907 he was made hon D.C.L. Oxon and knighted. An associate of the Institut de France and of the Belgian Academy. His works in-An associate of the Institut de France and of the Belgian Academy. His works include: 'The Herkomers' (1910), 'Found' (1885), and 'The Chapel of Charterhouse' (1889), both of which are in the National Gallery of Brit. Art), 'Portrait of Miss Katherine Grant,' 'Portrait of the Lady in Black,' 'Hard Times,' 'On Strike,' 'The Guards' Cheer.' Long conspicuous by reason of his great beard, he was clean charge in the constant of the strike,'

ov reason or his great beard, he was clean-shaven in later years.

Herm, small is, of the Channel Is. After the First World War it was developed as a holiday resort. It can be visited in the summer from Guernsey, from which it is distant 3 m. The pro-

Herma Pillars, pillars smaller at the base than at the top, which generally terminated in a head of Herma. They were found in Attica in the streets of the tns., and after the time of Hippar hus, the son of Plaistratus, they were also erected along the country roads as m. stones, Hermes being the god of traffic. They were particularly numerous in Athens, and in the mrkt.-place they formed a long colonized resching from the Hall of in the mrkt.-piace they formed a long colonnade reaching from the Hall of Paintings to the King's Hall. It was the charge of sacrilogiously mutilating these figures which caused Alchaudes to flee from Athens in \$15 and throw in his lot with the Spartans.

Hermandad, The (Sp. 'brotherhood'), association of the cities in Aragon and Castile, formed in the middle of the thirteenth century to defend their liberties. It was more firmly organised in 1297, when Sancho IV. came to the throne with the experse object of resisting the tyranny and exactions of the nobles, and received favour from Ferdinand and Isabella, who endowed it with large powers of summary jurisdiction. But as the power of the crown increased, so that of the II decreased, and about the middle of the sixteenth century it coased to exist. The name was, however, borne by a body of police in Castile, whose chief duty it was to protect the roads. See A. R. Lesage, Histoire de Gil Blas de Santillane, 1735.

Hermann, or Herman, see Arminius. Hermann. Johann Gottfried Jak Hermann, Johann Gottfried Jakob the stamens reach maturity first, or 1772-1848). Ger. classical scholar, b. at protogymous dichogamy, in which the car-

Leipzig. He was educated at the univ. of his native city, and was made prof of philosophy there in 1798, becoming prof. of eloquence and poetry in 1803. He made a special study of classical poetical metres, publishing his Elementa doctrinæ metricæ, in 1816. He also wrote on Gk. grammar, and pub. De emendanda ratione Grorcæ grammaticæ (1801). His other works include eds. of Aristophanes's Clouds; Aristotle's Poetica; Plantus's Trinummus, hesides an ed. of Æschylus, and the remainder of Erfurdt's Sophocles. See lives by O. Jahn, 1849, and H. Kóchly. 1874; and U. von Wilamowitz-Moellendorf. Geschichte der Philosophie, 1921.

Hermannic, or Ermanaric (d. A.D. 376), king of the E. Goths, founder of their kingdom, which probably included N. Hungary. Lithuania, and S. Russia. He was defeated by the Huns during the migrations of the peoples of N. Europe, and fellow his over small. and fell on his own sword. See W. K. Grim, Die deutsche Heldensage,

1829.

Hermant, Abel (b. 1862), Fr. novelist, b. in Paris. Educated at the Lycée Bonaparte and at the Condorcet. President of the Societé des Gens de Lettres (1902). of the Société des Gens de Lettres (1902). Member of the Fr. Academy. A brilliant satirist of the wealthy bourgeoiste of France. Mémoires pour servir à l'histoire de la société, 190, 1, 1 the general title of his chief work in this vein. Le Caravanserai, (1917), a study of wealthy compoplitans in Paris, is probably his most widely known book. Other works: La Mission de Cruchod (1855), Madoré (1888), La Carrière (1891). Caeurs privilegés (1903), L'Esbrouffe (1901), La Belle Mindame Héber (1905), La Journe brice (1920), La Pehle Femme (1923), Le cycle de lord Chelsea (4 vols., 1923). See Peltier, Abel Hermant, 1921. Hermant, 1921.

Hermaphrodite, so named from the mythical Hermaphroditus (q.r.), is a living organism containing in itself a combination of the essential male and female functions and structures. It is very doubtful if true hermaphroditism is present in the higher mammals, though it is common in many of the lower orders, as in the sluggish leech and snail, the fixed ovster, or the parasitic tapeworm. Many flowering plants are hermaphroditic, though of vary-ing degrees of inclinacy; in the case of the arum, the male organs are situated above and distinct from the female organs, but in the orchid the stomens and carpels are united; this is paralleled in the case of the locch, where the two elements are distinct and separate, though not so in the snall. Some animals may pass through embryonic hermaphrodutism, though this bryonic hermaphroditism, though this condition is doubtful in man as sex appears to be predetermined in the fertilised ovum. (See Herepity.) Self-fertilisation is largely prevented by the two elements developing at different times in the organism. This 'want of time keeping' is termed dichogamy in botany, and may be either prolandrous dichogamy, in which the stamens reach maturity first, or

pels first reach full development. earlier maturing of the male element is the more common occurrence, the hag-fish yielding an example from the animal kingdom. Self-fertilisation among animals is rare, but it is found in the fish Serranus and in the tape-worm.

Casual or abnormal hermaphroditism is occasionally found in fish where an ovary is altuated at one side and a testis at the other, in which case it is usual for only one organ to develop and one sex to pre-dominate, with mere indications of the other. Sometimes in such insects as e.g. a butterfly, one pair of wings will be indicative of the male sex and the other pair will be female, or the under and upper surfaces may be of different sex appearance.

False hermaphroditism may occur in the higher mammals where malformation has resulted in a female animal possessing the exterior appearance of a male or vice versa. Much discussion has taken place versa. Much discussion has taken place from time to time relative to herma-phroditism and primitive conditions, but the general opinion appears to be that hermaphroditism is not a reversion to, nor a survival of, a primitive condition, but rather a secondary acquisition.

Hermaphroditus, son of Hermas and Aphrodite, b. on Mt. 1da. He was finally united into one person, having the characteristics of hermaphroditus, with the nymph of the Carian fountain Salmacis. The statue by Polycles (fourth century B.C.) is

tamous.

tamous.

Hermas, probable author of The Shepherd (Pastor Hermæ), an early Christian allegorical and hortatory treatise divided into three parts: 'Visions,' 'Mandates,' and 'Similitudes.' H. is usually classed as one of the apostolic fathers (q.v.), but there is much discussion as to his identity. The Muratorian canon makes him brother of Pins I bishon of Rome (c. 130-51) of Pius I., bishop of Rome (c. 139-51). The work is prized as a relic of the primitive church, describing second-century Christianity in Rome. Some recent Christianity in Rome. Some recent critics think it may originally have been a Jewish book, revised and onlarged later by a Christian writer. The date usually assigned to it is between A.D. 100 and 150. The shepherd or angel of repentance ap-The shepherd or anger or rependence appears to H. in the fifth vision, and addinaturation (twelve mandates and ten similitudes) to the message he is to deliver to the people. The seem is laid deliver to the people. The scene is faid in Rome and the neighbourhood. Ireneus, Clement of Alexandria, and Origen highly esteemed the work, and it was publicly, read in churches at one time, but definitely outside the sacred canon by the fourth century. It aimed at rebuking world-liness and calling sinners to repentance. See J. A. Neander, History of the Church, 1825-52; Sir J. Donaldson, Apostotic Fathers, 1874; C. T. Cruttwell, Early Christianty, ii., 1893; J. B. Lightfoot, Apostotic Fathers (ed. by J. R. Harmer), 1893; H. U. E. Kruger, History of Early Christian Literature, 1897; O. von Gebhardt, A. von Harnack, and T. Zahn (ed.) Patrum apostolicorum opera, 1920; E. Hennecke, Neutestamentische Apokryphen, 1924. Clement of Alexandria, and Origen highly 1924.

Hermeneutics (Lat. ars hermeneutics, to interpret; from Hermes, the messenger of the gods), the science or art of interpretation or explanation of the language of speakers or writers. More especially applied nowadays to the explanation of the Holy Scriptures, covering practically the same meaning as 'exegesis,' a term more often used at the present time. See EXECUSIS.

Hermes, Georg (1775–1831), Ger. Rom. Catholic theologian and philosopher. Ho Catholic theologian and philosopher. Ho was founder of the school of Hermesians. His rationalistic doctrinos, influenced to some extent by Kant and Fichto, were embodied in his Einleitung in die christkatholische Theologie (1819-29). They were in high favour till the death of Spiegel, archilehop of Cologno, in 1836. Pope Gregory XVI. issued a brief condemning his teaching two years later, but by that time his school had practically vanished. His other prin. work was (Institute Dogmatik (1831-36). See W. Esser, Denkechrift auf Georg Hermes, 1832; K. Eschweiler, De swei Wege der neuern Theologie, 1926.

Hermes, one of the anct. gods of Greece, son of Zous and Maia, identified by the

Roms, with Mercurius. The chief characteristics of his many-sided nature were acteristics of his many-sided nature were inventiveness and versatility, and he is represented as possessed of fascination, trickery, and cunning. A legend tells of his invention of the lyre from the shell of a tortoise, and stealing of fifty head of cattle from his brother Apollo on the very day of his birth. His guilt was discovered through Apollo's gift of prophecy, but he was partoned and granted his brother's friendship and various privileges

in exchange for his wonderful mudcal retiros into solitude in order to live a more instrument. His original functions and primitive character are quite uncertain. eremite' were apparently used indistructions. The words 'hermit' and primitive character are quite uncertain. eremite' were apparently used indistructions and the chief seat of his worship. He appears to have been closely connected ling now generally adopted, 'eremite' appears to have been closely connected ling now generally adopted, 'eremite' are apparently adopted, 'eremite' appears to have been closely connected ling now generally adopted, 'eremite' are appears to have been closely connected ling now generally adopted, 'eremite' are appears to have been closely connected ling now generally adopted, 'eremite' and primitive character are quite uncertain. bp. and the chief seat of his worship. He appears to have been closely connected with almost every phase of life. He was both the messenger of the gods and the guide of the dead to Hudes (Ψυχοπομπός). As god of the roads and of wayfarers he was honoured by stone heaps and pillars of 'Hermæ' (q.r.), often set up as milestones and terminating in a bust. H. was the god and terminating in a bust. H. was the god of exchange and barter, and even patron of thieves, hence regarded as the giver of gain—any unexpected windfall being called opator. From this may have developed the conception of H. as a god of fertility. He was also the god of dreams, gymnastics, and eloquence. As herald he was mostly represented in art with winged feat, a flat hypod-hypmed hat (regrees) feet, a flat broad-brimmed hat (meravos), feet, a flat broad-brimmed hat (reraces), and a wand (repression or caducous). See Sir J. G. Frazer, Golden Bough (2nd ed.). iii., 1900; A. Lang, Myth, Poliud, and Religion, ii., 1887; L. R. Farnell, The Cults of the Greek States, v., 1909.

Hermes Trismegistus, see HERMETIC BOOKS and THOTH.

Hermetical Seal, in alchemy and chom. is the method of sealing a glass yessel by

is the method of sealing a glass vessel by actually fusing the glass, without employment of a cork or stopper. It is so called after Hermes Trismegistus (q.v.),

mythical founder of chemistry.

Hermetic Books, form of encyclopedia,
the sacred canon of the anet. Exyptians, fragments of which are all that survive. It originally consisted of forty-two books. at originally consisted of forty-two books, divided into six sections, treating of religion, art, science, geometry, astronomy, medicine, liturgical rites and ceremonies, hymns, laws, the nature of the gods, etc. The word 'hormetic' is derived from Hermes Trismegistus, the Gk. designation of Thoth, the Egyptian god of intelligence. The books are evidently based on Egyptian mythology. but of intelligence. The books are evidently based on Egyptlan mythology; but neither the time at which they were written, nor the author, can now be determined. Fragments of the Gk. and Lat. texts exist in the writings of Stobeus, Oyrillus, Lactautins, and Sunday, some of which were trans. Into Fr. by Ménard in 1868. Traces of Neo-Platonist dens can be traced in the books, as well as undications of the influence of the Jewish philosopher, Philo. See A. Kingsford. The Hermetic Philo. See A. Kingsford, The Hermetic Works, 1885.

Hermias, (1) Gk. philosopher of the Alexandrian school, and a disciple of Proclus. Wrote a commentary on Plato's Photelage. (2) Christian philosopher of Proclus. Wrote a commentary on Plato's Phaetras. (2) Christian philosopher of the fourth century. One small thesis of his is extant, in which he attacked pagan philosophy for its illogicality. See van Otto, Corpus apologetarum, Jena, 1872. Hermione (mod. Kastri), an anct. coast-vil. of Greece, prov. Argolis and Corinthia. The rocky peninsula of Visti forms a double port N. and S. Ruins of temple to Pagadon remain. It was

appearing only in poetry, etc. Anchorite is another synonym. As early as the third century Hs. began to appear in the Christian church, and the advocates of ascerticism were the first to set the ex-ample by withdrawing from the cities and taking up their abode in rudely-formed huts in desert or in forests. But these, as But these, as a rule, went in companies, whorous the H. went a step further and withdrew altogether from mankind, living alone. The first H. is said to have been Paul, a native of the Lower Thebaid, who, in the time of the Docian persecution (250), fied into the desert. His story is told by St. Jerome, who records that he was visited by St. Anthony, another auchorite, who was generally held to be the first great ex-ample and preacher of the H. life. But the St. lifes, who spent their lives at the tone Stylites, who spent their lives at the tops of pillars, and the Busci, who lived on herbs, were not true lis., nor were those who, in later times, separated themselves from their fellow-men to live in caves solely to avoid intercourse with society, and not from any religious motives. Hernitism was not so popular in the W. as in the E. church, probably owing to the un-affability of the climate, and as monasteries developed Hs. became more scarce.

Hermitage, dry, red wine, resembling Burgundy in colour and body, obtained from the vineyards of the Rhone valley. It is not dissimilar from the best kind of

claret.

Hermit-orab, family of unsymmetrical crustaceans characterised by a hook-like attachment to the pleopods, by means of which the annual can secure itself within the shell. "Lupagurus bernharlus, the commonest Brit. species, generally inhabits the shell of the whelk. See also COMMENSALISM.

Hermocrates (c. 460-407 B.C.), Syracusan statesman and general, who succeeded in uniting the siccliots (424) so as to enable them to resist the Attentan expedition against Sicily (115). After the Athenian defeat (413) he helped Sparta against Athens, and held a high command at the naval battle of Cynossema (412). On his defeat at Cyzicus he was deprived of his command and exiled (409). H. fought later against Carthage, and was killed in attempting to return to Syracuse (407). He was one of the most energetic, patriotic, and incorruptible leaders of antiquity. See Thuc. iv.-viii.; Dlod. xiii.; G. Groto, Hist. of Grece, x. 81, 1846-56. Hermogenes (fl. A.D. 170), Gk. rheterician of Tarsus, Cilicia. At the age of fitteen his reputation as ofator and lecturer

Corintia. The rocky peningula of Visti forms a double port N. and S. Ruins of a temple to Poseldon remain. It was founded by the Dryopes. See Pansanias, fi. 34; Herod., viii. Pop. about 3000.

Tertullian accused him of hercey in Adversus Hermogenem. See Theodoret, Fab. Hæret, i. 19.

Hermon (modern Jebel-esh-Sheikh), mt.-ridge and culminating point, forming S. extremity of the Anti-Libanus range, S. extremity of the Anti-Libanus range, Syria, on the border of Palestine, 35 m. from Damascus. Called Sirion by the Sidonians and Senir by the Amorites. The modern Arabs call it Jebel-esh-Sheikh, 'Old Man Mountain' or Jebel-eth-Theil, 'snow mount.' The crown has three peaks (c. 9160 ft. high) covered with snow for most of the year, and it towers high above the anct. etty of Dan and the sources of the Jordan. The lower slopes have rich vecoriation and are planted with have rich vegetation and are planted with vines and fruit-trees. Ruins of anct. temples surround it, mostly consecrated to Baal. Heb. poetry constantly mento Baal. H

(mod. Erment), Hermonthis (mod. Erment), tn. of Kena prov., Upper Egypt, on R. Nile, 8 m. from The hew. As the anct. Egyptian 'On of the South it was famous for its worship of the hawk-headed god Mont (Zeus) and Horus (Apollo). There are ruins of a temple of Cleopatra's time. The burlal place of the sacred bulls of Mont was discovered in 1927. The modern tn. has sugar refineries, post and a railway station. Hermonthis telegraph offices and a railway station.

Pop. about 7000.

Hermoupolis, or Syra (Nea-Syros), seaport and cap. of Syros Is., Greece, 78 m. from Athens. It is the seat of the home from Athens. It is the seat of the home of the Cyclades, of a (ik. archbishop, and a Rom. Catholic bishop. Commercially it is next in importance to Athens, the Piracus, and Patras, its position in the Ægean making it a centre of the Levant trade. There are manufs, of flour, leather, cotton, and 'Turkish delight.' H. has an arsenal, gymnasium, theatre, and custom-house. Shipbuilding is car ward on. Pop. 21,000. and custom-house. Si ried on. Pop. 21.000.

Hermsdorf, Nieder, tn. in Silesia Poland, is 2 m. W. of Waldenburg (Wal-brzych). It has coal and fron mines.

Poland, is 2 m. W. of Waldenburg (Walbrzych). It has coal and iron mines. Pop. 12,000.

Hern, Gertrude Franklin, see Atherron. Hernandez, José (1831-91), Argentine poet; b. at San Martin, prov. of Buenos Aires. In late 'sixtes, ed. Revista del Rio de la Plata. Buenos Aires. Follower of insurgent Lopes Jordan, 1870-72. Many years legislator in native prov. His only considerable poem is Martin Fierro (1878), an epic of the Argentine.

Philip II. There are four genera in ed, and the chief of these is Hernandia.

Hernani, tn. on the Urumea, prov. of Guipuzcoa, Spain, is 8 m. S.E. of San Sebastian. It played an important part in the Carlist wars (1835-40). It consists the constant of the constant part in the consta

in the Carlist wars (1835-40). It contains a modern palace, and has iron mines and cotton factories. Pop. 5000.

Herne, tn. in Westphalia, Germany, It m. N.E. of Essen. It has coal mines, and iron works and is the terminus of the Ridine-Herne canal. Pop. 98,500.

Herne, James A. (James Aherne) (1840-1901), Amer. actor and playwright. He acted in many plays of his own, the first being Hearts of Oak (1878), Drifting Apast (1885), The Minute Men (1886), and Margaret Fleming (1890) followed, but his next great success was the rural comedy Shore Acres, performed at Chicago (1892). Share Acres, performed at Chicago (1892), which ran for nearly six years. His last production was Sag Hurbour (1900). See

production was Sag Harbour (1900). See
L. (1. Strang, Famous Actors of the Day in
America, 1900.

Herne Bay, tn. and watering-place, in
the co. of Kent, England, on the estuary
of the Thames, is 6 m. N.E. of Canterbury.
It was founded in 1830. Canary grass,
introduced by Flemish immigrants, is
grown in the vicinity. Pop. 16,600.

Herne Hill, suburb of London, 4 m. S.
of St. Paul's. The name is supposed to
be derived from the herons that frequented
the Effra. a rly, fornerly flowing through

the Effra, a riv. formerly flowing through Herne Hill. Ruskin spent the early part

of his life here

Herne the Hunter, traditional figure of riente me Hunter, reantonal ngare of cid Eng. legend, popularly supposed to roam at midnight near an old oak, famed as 'Herne's Oak,' in Windsor Forest. The oak was thought to have been blasted by the hunter's evil spirit, and was blown down in 1863 (c. 650 years

old). Hernia, or Rupture, surgical term, signifying the protrusion of any part of the signifying the practision of any part of the body from the cavity in which it should be contained. In popular language, a upture means an extrusion of a portion of the contents of the abdominal cavity. A rupture may be present at birth, from A rubture may be increase as batta, as in the failure of closure of the eavity, as in the case of an umbilical H., when the navel is unclosed at birth. Again, rupnavel 14 unclosed at ourn. Again, rup-tures may occur in early life, and are then known as intantile 11s. The opening of an intantile umblical H. usually closes with age, the closure being generally firm and permanent. An umblical H. may appear in fat individuals, particularly in temales on account of pregnancy, and, if neglected, may attain an enormous size. Impures are generally due to weakness of the body wall, though they are more liable to occur in individuals who throw con-iderable strain ou their abdominal walls, a, for example, those who do heavy work. Persons who are subject to broughitis are apt to suffer from H., the condition being His only considerable poem is Marin apt to suffer from it, the condition being Fierro (1878), an epic of the Argentine.

Hernandissees, older of cotyledonous plants, clovely allied to the Lauracem (q.e.), but differing from that order in the rectum, the position adopted being that the flowers are epigynous. It probably to blame. The most common received its name from the Sp. naturalist form of H. secure in the groin, through the Hernandez, who was sent to Mexico by failure of closure of the canals, i.e.

passages, in this region, or the reopening expressing the area of a triangle in terms of these canals in later life. The first of its sides detectable sign of a H. is a swelling due to a bowel containing air or solid sub-stance. Not infrequently, however, the first symptom is obstruction of the bowel. The term 'a twist of the bowel ' may be due to this fact, because the twisting or blocking may occur at any moment and necessitate surgical interference. common saying that a person with a rup-ture is in the condition of a man with a ture is in the condition of a man with a packet of gunpowder in his pocket, which may go off at any moment. The presence of a rupture may prevent admission to some forms of gov. employment, and in the case of insurance a considerably increased premium is required. In early life ruptures may close with the aid of a suitably made and fitted truss. In healthy individuals, when a truss falls to cure, operation is desirable, and if the truss caunot close the aperture, so as to retain the bowel in the abdomen, operation is necessary. As in these circumstances the operation is performed under favourable conditions, it differs from one undertaken from emergency and urgency, when the bowel is obstructed (twisted). This, the 'radical' cure, is in most cases, rins, the radical curv, is in most cases successful. A rupture may cause obstruction of the bowel, or the bowel may be strangulated, when a portion of its wall is gripped so tight that death of the gripped part, and of the patient, results.

Hernia (in horses), see under Horse

Hernia (in horses), see under Horse (Diseases).
Hernici, It. people of Sabine origin, dwelling in anct. Latium in the Apennines between the Trerus and Lake Fuchus, about 60 m. from Rome. They made an equal alliance with the Roms. In 486 B.C., remaining loyal till 362. They then rebelled, and though falthful during the Lat. revolt in 340, later joined the Samiltes against the Roms. by whom they were subdued in 306 B.C. In 211 they received the rights of Rom. citizens. Anagnia was their cap. N. dwelt the Æqui and Marsi, and S. the Volsei.
Hernosand, seaport th. of Sweden, cap. of the lan of Vesternorland on the W. coast of the is. of Herno, in the gulf of Bothnia. Pop. 12,000.

Hero, see HEROIC

Hero and Leander, 'the Juliet and Romeo of the Dardanelles.' H. was the romeo of the Dardanelies. It. was the priestess of Aphrodite at Sectos. L., a beautiful youth of Abydos, saw and fell in love with her at a festival of the goddoss. Guided by a lamp, L. swam across the Hellespont nightly to visit II., but one stormy night was drowned. In despair she cast herself from her tower and perished with him. The romantic poems of the Alexandrian period dealt with the tragedy.

Hero (Heron) of Alexandria: (1) Noted Gk. matchematician and writer, probably of the latter half of the first century A.D. He was especially skilled in geometry, mechanics, and pneumatics, and famous for inventing various machines and contrivances, such as "Hero's Fountain," a schoolmaster, temple attendant, shoetramengine, a water-clock, and other Though H.'s name had long been known, automata. H. discovered the formula fragments only had survived till the

$$\sqrt{s(s-a)(s-b)(s-c)}$$

(a, b, c being the lengths of the sides, s the semi-perimeter). (2) 11. the Younger (fl. seventh or tenth century A.D.), probably a Byzantine land-surveyor, or a philosopher and writer on astronomy and warfare.

Herod, or Herodes: (1) Herod the Great (c. 73 B.C.-4 B.C.), King of the Jews, so called from his great power and talents; became governor of Galilee in 47 B.C. After the death of Julius Caesar, he was made king of Judwa by Antony (40 B.C.), but only made himself master of Jerusalem of the A. R. Allender of Jerusalem of the A. Allender of Jerusalem of J after a prolonged siege. He rebuilt the temple with great magnificence, and erected a theatre and amphitheatre in the city, where games in honour of Augustus were celebrated. The N.T. tells how he ordered the massacre of the Innocents at Bethlehem, and of his dreadful death in 4 B.C. (Matt. ii). (2) Herod Antipas, son of H. the Great, and appointed Tetrarch of Galileo on his father's death. He put of Galileo on his father's death. He put to death St. John the Baptist because he censured H.'s marrage with his brother Philip's wife, Herodias. In A.D. 38 he tried to obtain the title of king, stimulated by the ambition of Herodias, but his nephew, Agrippa, prejudiced the Emperor Caligula's mind against him, and he was stripped of his dominions and exiled. (3) Herod Agrippa I., grandson of Salome, sister of H. the Great. In A.D. 38 Caligula gave him the title of king and conferred on him the dominions of H. the Great. This was that H. who caused St. James to be put to death and St. Peter to be imprisoned. He died at Crearca in A.D. 44. (1) Herod Agrippa II., son of the foregoing. He was reduced to a Rom. proy. on his father's reduced to a Rom. prov. on his father's death, being too young to govern Judges, and later was made superintendent of the temple at Jeru-alem, and had the power of nominating the high priests. He lived a good deal in Jerusalem, but was driven from the city in the revolt which ended so fatally for the Jews. In the war (A.D. 67) he took the Rom. side, joining Cestius, the Rom. commander. He rendered great services to Titus during the siege of Jerusalem, and after its capture in A.D. 70

Jerusalem, and after its capture in A.D. 70 returned to Rome, where he is said to have died about A.D. 100. With him terminated the Herodian line. See C. Noldins, History of Herod the Great, 1754; H. Willrich, Das Haus des Herodes, 1928. Herodas, or Herondas, Gk. poet of the third century B.C., belonging to the Alexandrian school. He was a writer of mimes, realistic dramatic scenes of everyday life, much in the style familiar from the celebrated idyli, Gorgo and Practice of Theoeritus, of whom he was a younger Theoritus, of whom he was a younger contemporary. They are written in racy

discovery in 1891 of a papyrus MS. in El Fayun, Egypt. The mimes are vivid clean-cut skotches in dialogue, some 100 lines each in length frequently coarse but obviously drawn with unfinching realism done of Greece and Persia. Books V. to obviously drawn with unflinching realism from life. The parody of a scene in a Gk. court of law, mime II., the little servant-maid's tactful wit, mime, V., are good examples of H.'s powers. The MS. was ed. by Sir F. G. Kenyon, 1891. See also eds, by O. Crusius, 1905; by J. A. Nairn, 1904, the latter with notes introduction, etc., and verse trans. by H. Sharpley in A Realist of the Eggen, 1906.

Herodes Attous, see ATTIOUS HERODES. Herodian, or Herodianus, Gk. historian of the third century A.D., author of a hist. of the Rom. empire from the death of Marcus Aurelius to Gordianus III., A.D. 180-238. Little is known of his life except that he held subordinate office in Rome, A.D. 203. His work is valuable as a contemporary continuation of the lists of Dion Cassius, but his omissions, e.g. of the growth of Christianity, etc., are striking.

Herodians, political party of Jews, who were adherents of the blumous description.

were adherents of the Idumæan dynasty and warm supporters of Herod the Great. and warm supporters of infroit the Great.
In the N.T. they are mentioned with the
Pharisees as being hostile to Jesus (Mark
iii. 6; Matt. xxii. 6). They were also
called Borthuslans by the rabbis because
they were friendly to the family of

they w Bothus,

Herodotus (r. ''4-c.125 B.c.), Gk. historian, sometimes called the 'father of history,' b. at Halicarnassus, a dependency of Porsia in Asia Minor. He was the son of Persia in Asia Minor. He was the son of Lyxes and Rheo (or Dryo), and the nephew of the epic poet Panyasis, who was put to death by the Persian tyrant, Lygamis, on a charge of treason (c. 457). About the year 464 he left Halicarnas-us About the year 404 he left inflications and travelled in Greece and in foreign countries. He visited Athens Corintly, and Thebos, and other great cities of Greece and the important is, of the archipelago. He also journeyed through Macedonia and Thrace to the shores of the Black Sea, and travelled inland to Susa, the cap. of Persia, Babylon, and then southwards to the anet, city of Tyre through Palestine to Egypt. He also visited S. Italy and Sicily, but the dates of his various journeys are quite uncertain. H. thus had a personal knowledge of the countries of which he wrote. On his travels he collected a great amount of geographical, ethnological, and archaeological knowledge, of which he made such excellent use in his hitt. We know very little with certainty about the facts of his life. It is probable that he resided in the is, of Samos about 437, thus putting him-self under the protection of Athens. After self under the protection of Athens. After six or seven years he returned to Hall-carnassus, and, according to Suidas, took an active part in the expulsion of Lygdanis. He became a member of the Athenian confederacy, but about 447 went to Athens in the hone that he damis. He became a member of the Athenian confederacy, but about 417 went to Athens in the hope that his writings would be more appreciated there then they had been in his native place. In 445 he was voted a sum of ten talents (£2400) as an acknowledgment of his genius. In 443 he assisted in the foundation of the Corneille and Mollère. It has a marked

IX. relate the hist. of the two great wars of the Persian invasion. His style is very discursive, and he expatiates with creat charm on the climate and geographical features of the various countries graphical reatures of the various countries to touches upon, as well as upon the manners and customs of the strange people who inhabit them. His hist, has always been praised for its style, which owes its attraction partly, no doubt, to the fact that it was written primarily for recitation. Its veracity has not infrequently been questioned. With regard to anet, hist, he was no doubt very creduious, but his account of the two Persian lous, but his account of the two Persian wars is accepted as the great authoritative version by all modern historians. He was very diligent in collecting materials for the early part of his hist, but lacked judgment. This hist, was first trans, into Eng. by Hittohymy in 1727 (Spron Really). ment. This list, was first trans, into Eng. by Littlebury in 1737. Canon Rawlinson's trans., 1858-60, has many valuable annotations. The best cds. of the text are those of H. Stein, 1869-71, A. H. Sayce, 1883; R. W. Macan, Herodotus, (iv.-vi., 1895; vil.-ix., 1908); C. Hude, 1908; and A. Godley (with Eng. trans.), 1921-24. See J. Rennell, Geography of Herodotus, 1800; J. B. Bury, Ancient Greek Historians, 1908; W. How and J. Wells, A Commentary on Herodotus, 1912; and A. W. Lawrence, Herodotus; Rawlinson's Translations, Rivised and Annotated, 1935; J. E. Powell, Herodotus, 1939, 1949.

Heroic, having the qualities of a hero. In classical mythology a hero was something between a god and a man, not quite equal to the former, but raised above the latter by his superior strength, courage, and intelligence. The qualities that go to make a hero may be divided into two classes, the physical and meta-physical. In anct. times the former alone were taken into account; a man who possessed great physical strength and courage coupled with daring and determination was H., whether in other respects he was good or bad, so that in olden times the majority of heroes were warriors. In later times it came to be understood that certain other qualities also went to the making of heroes, and moral courage and integrity were held to be the attributes of heroes equally with physical courage and daring. So that on one hand we have the heroes so that on one hand we have the heroes who have won the coveted title by their superior physical qualities, their courage, fortitude, and daring, and on the other, those who may be devoid of all the great physical qualities, but who possess moral courage, fortitude, and determination beyond their fellows, and who are equally, if not more worthy of the title. if not more, worthy of the title.

tendency to long rhetorical and de-clamatory speeches, and its vehicle is the heroic couplet. The link with the Elizabethan drama is Davenant, whose Albovine (1629) possesses all the char-acteristics of the heroic drama except the clamatory speeches, and its vehicle is the bis dormant. See B. Jouvin, Héroid, sa vic et ses œuvres, 1868. Heron, name given to the species of ciconiiform birds belonging to the family Albovine (1629) possesses all the characteristics of the heroic drams except the heroic couplet. In his preface to the Conquest of Granada, 1070, Dryden asserts that 'an heroic play ought to be an imitation in little of an heroic poem, and consequently that love and valour ought to be the subject of it.' Dryden was the chief exponent of the H, P., which had its vogue between 1660 and 1680. His chief plays of this sort are: The Indian Quen (1661), Trunanic Lore or the Royal Martyr (1669), The Conquest of Granada (1670), and Aurengzebe (1675). In the last-mentioned play, Dryden confessed himself 'weary of his long-loved mistress, Rhyme,' and henceforth devoted himself to blank-verse tragedy. In 1671 the duke of Buckingham and other wits had purodied the H. P. in a delightful burlesque, The Rehearsol. Heroics, however, still flourished, until the great craftsman, Dryden, deserted rhyme for blank verse. Nevertheless, the H. P. had not entirely disappoared by the end of the century. See J. Maldment and W. Logan, Dramatists of the Restoration, 1873, and W. Kor, Essays of John Dryden, 1900.

Heroic Verse, in prosody, is applied to rhymed iamble couplets, often called heroic couplets. It was first used by Chaucer in the Legend of Good Women. It attained

raymen faminic conflicts, often canet across couplets. It was first used by Chaucer in the Legend of Good Women. It attained its most polished form with Dryden and Pope, but has since been used with great freedom by Byron, Keats, Swinburne, and

Heroin, or Discetylmorphine, drug obtained from morphine and administered by injection. Acts in much the same way as morphine, but on account of its special influences on the nervous system of the influences on the nervous system of the breathing apparatus it is used to relieve paroxysms of coughing. The drug liabit is sometimes so acquired. In 1931 the Conference on the Control of Narcotic Drugs drew attention to the highly dangerous character of H. as a drug of addiction, and the Permanent Opium Board in 1949 pub. a report which noted an alarming increase in its use.

Heroid, Louis Joseph Ferdinand (1791–1833), Fr. musician and compuser, b. in Paris, son of an accomplished manust (a

Paris, son of an accomplished paunst (a pupil of C. P. E. Bach). He studied at the Paris Conservatory, under Mehul, and in. 1812 gained the Grand Prix de Rome with a cantata, La Duchesse de la villure. He then went to Italy and also visited Vienna. His first opera was La Uicontu di Enrico V., first produced at Naples (1815) with moderate success. In Paris he collaborated with Boieldieu in writing an opera entitled Charles de France. His arst Fr. opera was Les Rosieres (1817) which had a good reception. This was followed by many other works, of which the best known are: Zampa (1931), which was immensely successful in France and also in German, where it is considered his masterpiese; and Le Pri aux Cleres (1832), a graceful and lively work. Other works include the operas La Clochette

Ardeldee; they are characterised by long Ardeldes; they are characterised by some necks and legs, slender hodies, and beautiful plumage. They frequent lakes, fens, and the mud-flats found on sandy shores, where they wade into the water and often stand ankle-deep for a considerable time, searching for prey; they capture fish, molluscs, worms, etc., by spearing them with their long bill, and their appetite seems insatiable. Hs. nest on trees, bushes, ivy-covered rocks, or reeds, making a loose fabric of sticks lined with gruss, leaves, etc.; they lay greenish or drab-coloured eggs, varying in number from two to seven with the different species. Ardea is the largest genus, and its distribution is worldwide; A. cinerea, the common European II., is found also in Africa, Asia, Japun, and Australia; white Hs., or extets, are generally smaller than other species. A. garzetta being the smallest of all; this beautiful bird, which is called the little egret, has long flamentous plumes and two lengthened crest feathers, which are said to be temporarily lost after breeding; this species is occasionally found in Britain; species is occasionally found in Britain; A. allo, the great white H., ranges from Central Europe to Africa and Asia; A. occudentains, the white H. of Florida, is an even larger bird; A. golinth, probably the largest of all species, has a reddish head, and under-surface. The genus neck, neck, and under-surface. The genus Nycticorex, or might Ha., are remarkable for the long, occupital feathers, blackish or white in colour, which are lost for a time after breeding; the species vary greatly in colouring, N. griseus, which occasionally visits Brit. shores, being greenish-black Holaurus, the bitterns, and Balarnicens, the snoebills, belong to the same family as it. H۶.

Herrera, Fernando de (c. 1534-87), Sp. lyrical poet, known ab El Divino, the Divino, b. at Seville. He had a protound admiration for the It. poets and took a

large share in introducing their metrical systems into Spain. His odes, especially those on the Battle of Lepanto and Don John of Austria, and his elegies on King Sebastian of Portugal and Sir Thomas More, are marked by grandeur, melody, and profundity, and entitle him to rank as the greatest of Andalustan poets. All his works are printed in the Biblioteca de autores españoles, xxxii. See A. Laso de Vega, Historia de la Escuela Poetica Serilana, 1876, A. Morel Fatio, L' Hymne sur Lepante, 1933, and R. Marin, kl Divino Herrera y la Condesa de Gelres, 1911.

Herrera, Francisco de (1576–1556, surnamed El Viejo (the Elder), Sp. historical and freeco painter, b. in Sevillo. He was a man of such violent temper and coarse manners that noither his children nor large share in introducing their metrical wit about court or in the Mermaid systems into Spain. His odes, especially Tavern (q.v.). Some time before 1627 he those on the Battle of Lepanto and Don John of Austria, and his elegies on King the sailed as chaptain to the action of the sailed as chaptain to the condition of the sailed as chaptain to the sailed as chaptain the sailed as chaptain to the sailed as chaptain the

manners that noither his children nor pupils would remain with him, although both his son and Volasquez learnt from him his energy of design and bold, vigor-ous touch. His skill as a worker in bronze led to his being accused of coining false money, and he sought refuge in the Jesuits' College, Soville, which he adorned with his celebrated 'St. Hermengild in Glory, and which won him the pardon of Philip IV.

Herrera, Francisco (1622-85), surnamed El Mozo (the Younger), to distinguish him from his tather 'El Viejo,' b. at Seville, from which he fled to Rome on account of from which he fied to Rome on account of his father's runtity. He became renowned fo. his privace of still lite. flowers, fruit, and fish. He also painted frescoes, and, in later life, portraits. On his return to Seville he became subdirector of its academy under Murillo (1660). His best picture is, perhaps, the 'San Francisco' in Soville Cathedral. His 'Assumption of the Virgin' in the Atocha church in Madrid, won for him the title of painter to the king.

Herrera y Tordesillas, Antonio de (1519–1625), Sp. historian, b. at Cuellar, Segora, Spain. He became secretary to Vespasian Gonzago, who commended him to Philip

Gonzago, who commended him to Philip II. of Spain, by whom Herrera was ap-

In size it is moderately small, and has thin, silvery scales which do not extend to thin, silvery scales which do not extend to the head, small teeth and open gills. It has only one dorsal fin and one short ventral, and there are no spines in the fins. It keeps close to the surface of the sea, swimming high in the water. The lower edge of the II. is flattened, and covered with bony plates varyingly sharp or serrated. It feeds like the whale by straining the water through its long gill-rakers, which form a dovetailed screen

capable of arresting the copepoda. It deposits its eggs on the bottom, which hatch out adhering in masses to stones and weeds. Its colour varies between a not weeds. Its colour varies between a not very pronounced green and blue, and its scales detach when the ilsh is roughly handled. It is a coldwater fish, and develops to a larger size in more N. lats. In the Channel it averages 12 in.; in parts of the N. Ses it reaches a length of 17 in. Those caught off the Brit. Isles are smaller than those caught off Iceland, these latter being harge and coarse. Ha are smaller than those caught off Iceland, these latter being large and coarse. Hs. are usually caught by drift-nets, but the hook and line is sometimes used, and the ligger is often employed on the Scottish coast. Hs take about two years to reach maturity, their silvery scales appearing when they have grown to a length of about 1 in. The number of eggs deposited by the female varies from 20,000 to 50,000, and the eggs are oneaue and have a by the female varies from 20,000 to 50,000, and the eggs are opaque and have a thick adhesive envelope. This fish is found in large quantities off the shores of the Brit. Isles, as well as along the E. border of N America, up to the const of Behring Strait, and is known in the White Sea of Russia and down the coasts of Norwey and Downerk and in the sea of way and Denmark, and in the sea of Japan, but it is not found in the Mediterranean. It is essentially a migratory fish, never remaining in any dist. for more than a few days, and is not influence d in this by latitude or Himate, for often it is earliest comets, live undoubtedly unobserved bein the further N., and in others the restore, and many of the smaller nebules and verse. The spawn is shed twice in the star clusters included in her brother's year, of which that of the autumn is the catalogue were her discoveries. In 1798

more conspicuous; but the season of either of these is often extended or delayed beyond the regular time. Hence, great vigilance, patience, and skill are needed in the capture of this fish. Hs. formed an important source of income in anct. times, and have been used as food from time immemorial The H. is rich in easily digestible oil: factories have been estab. for its extraction and preparation for human use. and the wall of the castle built by Edward the Eider still remains. Halleybury College, founded in 1806 by the E. India Company as a training school for its civil service, and which is now a public school, is

Heriford College, Oxford, in its present form is a modern foundation. Between 1283 and 1300 Elias of Hertford acquired one of sev halls which stood on the site and which became known as Hart Hall. In 1312 it was bought by Bishop Stapleton, the founder of Exeter College, on which college it was dependent until the second half of the sixteenth century. In 1710 Richard Newton became principal and, in spite of strengous opposition, suc-ceeded in obtaining a charter to estab. Hortord as a college in 1740. It lapsed in 180° and the buildings were acquired by Magdalen Hall, which was itself dis-solved in 1874, when its principal and scholars were incorporated as part of the new Hortford College.

Herifordshire, or Heris, inland co. of England, bounded on the N. by Cambridgeshire, on the R. by Essex, on the S. by Middle-ex and on the W. by Bu kinghamshire and Bedfordshire. The surface is hilly, but there are some fine pasture is hilly, but there are some fine pasture lands and preturesque parks and woods. It belongs mainly to the Upper Cretaceous rocks, which give place in the S. to the London clay. The print rive are the Lea the Colne, and the Ivel, and the Grand Junction (anal passes through a part of the co. The chief industry is agriculture, and in addition to grain of a choice quality, hav, vegetables and numerous fruits are grown for the London mrkt. There are a few manufer, straw-plat, silk and paper, together with brewing, tanning, parchiment-making, being the chief. The only industries of importance is brick-earth. In 896 a battle took place in this co. between Airrod and the Danes, and in the Wars of the Roses the buttles of St. Albans and Barnet were fought here. It Albans and Barnet were fought here. It is divided into six parl. divs., Hencel Hempstead, Hitchin, Hertfold, St. Albans, Watford and S.W. Hert- one memberforeachdiv.; and one bor. constituency.

1832.

's Hertogenbosch (Bois-le-Due), city of Holland, cap. of the prov. of N. Brabant, situated at the confluence of the Aa and Dommel, 28 m. S.S.E. of Utrecht. The city is well built and is crossed by sev. canal. In St. John's church (founded in the early fourteenth century) H. has one of the finest medieval churches in Holland. There are sev. other churches, a fine to.and sov. other conreces, a line thall, an episcopal palace, a court-house and gov. buildings which were formerly a monastery. H. had its origins as a hunting-lodge of the dukes of Brabant, it gradually increased in importance and in 1154 was raised to the status of a tn. and fortified with walls. In the mid-fliteenth century it was considerably enlarged. Numerous abortive attempts were made by the Netherlands to get possession of the tn, in the sixteenth and seventeenth conturies, but at length in 1629 it was taken after a five-months' siege. It fell to France in 1794; to the Prussians in 1814; and after Ger. occupation in the Second World War, to the British forces in the nutum of 1944. Pop. 53,300. Hertwig, Oskar (1819-1922), Ger. anatomst and embryologist; b. at Friedberg in

Hesse. Prof. of anatomy, Jena, 1878; at Berlin, 1888. In 1876 pub. Beitrage cur Kenntnis der Bidtung, Befruchtung und Theilung des thierischen Eier, which and Theilung des threischen Eier, which for the first time explained the mechanism of fertilisation. His other works include. Die Zeile und die Genebe (1893-1398), and Zeit- und Streifragen der Budogie (1894-97).

Hertz, Heinrich Rudolf (1857-91), Gerphysicist, b. at liamburg. He was intended for the profession of engineering, but described it o study experimental and

but deserted it to study experimental and mathematical physics under Von Helmholtz in Berlin. For the best solution of the problem of electric mertia he won the univ. pize, his paper, Kinetic Energy of Electricity in Motion, being pub. in 1880. In 1843 he was privat dozent (or univ. teacher not belonging to the professional staff) at Kiel, and from 1835 to 1889 prof. of physics in the Karlsrube Polytechnic where he made his remarkable experiments on cle trie waves based on Maxwell's theory of electricity and magnetism, for which the experimental proofs had been lacking hitherto. The result of his experilacking lithesto. The result of ms experi-ments was to prove beyond a doubt that ordinary light consists of electrical vibra-tions in an all pervading ether which possesses the properties of an insulation and of a magnetic medium (Hertzian Electric-Magnetic Waves). The appara-tus which he invented for the purpose was an electric resonator which could pick out and make evident the optiliations of elec-tic discharges which take place under certain conditions, as demonstrated by Kelvin. Having proved that these electric waves existed, he proceeded to show that they could be reflected; refracted, polar-

the practical purposes of signalling over considerably distance (see Wireless Telegraphy). His papers have been trans. Into Eng. by Prof. D. E. Jones, and pub. as Electric Waves (1893), Miscellaneous Papers (1896), and Principles of Mechanics (1899). See Sir O. Lodge, Hertz and his Work, 1895.

Hertz, Henrik (1798-1870), Dan. poet, b, of Jewish parents at Copenhagen. He passed his final examination in law in 1825, but the literary instinct in him was too strong, and in 1826 he pub. his first play. His innor's Strokes of Genius (1830), a comedy in played verso, was a complete in the property of the strokes of Genius (1830). a comedy in rhymed verse, was a complete novelty in Dan. literature, and his Gen-gangerbrere (Letters from a Ghost, pub. in the same year) is one of the best satires in Dan. His romantic national drama, Svend Dyrings Hus (1837), is one of his finest works, while Kong Rene's Datter inest works, while Kong Rene's Datter (1845) has been trans, into almost every European language (Eng. trans. 1850 by Sir Theodore Martin). His comedy, Fluttedogen, appeared in 1828, and his beautiful lyrics were collected in 1857-62. His Dramatir B orks (18 vols.) were pub. 1854-73. See monograph by H. Kyrre, 1018 1916.

1916.
Hertz, Joseph Herman (1872-1946), Jewish chief rabbi; b. at Rebrin in Czechoslovakia (then in Hungary); son of Simon H., Hebralst. Emigrated as a child to Ameri. He was educated at the College of the (tty) Now York, Columbia Univ. (Ph.D.), and the Jowish Theological Seminary, New York. Rabbi of the Congregation Adath Jeshurum at Syracuse, New York, 1894-98. Then he became rabbi of Witwatersrand Old Heb. Congregation. Johannesburg. Transvall. Congregation, Johannesburg, Transvaal.
From 1906-08 he was prof. of philosophy at the Transvaal Univ. College. Expelied by Boors as pro-Brit. during S. African war; returned when Brit. were in occupation. In 1019 house of war; returned when brit, were in occupa-tion. In 1913 became chief rabbi for the Brit. Empire. In Zionism H. belonged to the Mizruchi or orthodox party; and he was president of the Mizrachi Fodera-tion of Great Britain and Ireland. A consistent Zionist he was, however, never prominent in the movement, but as an Angle-Jewish leader he was consulted by the Gov. when the Balfour Declaration (q.v.), was in preparation. Of his many writings that which will endure the longest writings that which will endure the longustic probably his anthology, Book of Jewish tarthology, Book of James Martineau (1894), Backya, the Jewish Thomas a Kempis (1898), The Jew in South Africa (1904), The Strange Fire of Schlam (1914), Affirmations of Judaism (1927), Ancient Semitic Codes and the Mosaic Legislation (1928), Battle for the Sabbath at Genera (1932), Hertzberg, Ewald Friedrich, Count (1725-95), Prussian stateman; b. at Lettin. Earther Pomerante of noble

state for Foreign Affairs. He made the treaty of peace with Russia and Sweden in 1762, and carried out many other important negotiations—including a treaty with the U.S.A., 1785. His policy was anti-Austrian, and he favoured limited monarchy. Few were more constantly attendant on Frederick the Great during his last days. Frederick Wm. II., on his accession, made II. a count, Sept. 1786; but H. disagreed with the king's policy, and was dismissed in 1791. H. was exceedingly crudite—wrote on hist, statistics, and political systems; and from 1786 was curator of the Academy, to which he endeavoured to give a more Ger. character. character.

Ilertzog, James Barry Munnik (1866–1912), S. African general and statesman, b. at Wellington, Cape Province, son of atamer. Educated at Victoria College, Stellenbasch, and at Amsterdam Univ. Busine an advocate at Bloemfontein; undge of the Orange Free State, 1895. Commanded Boer forces of S.W. div., S. Afrean war, 1899–1902, and, on behalf of the Free State, was one of the signatories of the treaty of Vereeniging, 1902.

Zadiks Studios

GENERAL HERTZOG

On the grant of responsible gov. to the political leader of the Dutch in the Free rollical leader of the Dutch in the Free State and was always very slow in becoming reconciled to Brit, rule. As minister of justice in the first gov. of the Union of S. Airica, his bitter speeches steadily fanned the embers of racialism, and herearments operated in separation. soum Africa (1904), the Strange Fire strange for schaim (1914). Afternations of Judalem and he vehemently opposed all schemes of (1927), Ancient Semitic Codes and the Mosaic Legislation (1928), Battle for the Sabbath at Genera (1932).

Hertsberg, Ewald Friedrich, Count it was an open feud—Botha and Smuts Lottin, Farther Pomerania, of noble that the seminary of supported H., who now launched the new

Nationalist Party there with secession from the Empire as its main plank. In 1914-18 he stood out against co-operation with Britain, but, being convinced of the impracticability of rebellion, he tried to induce De Wet and Beyers to abstain from it. In the election of 1924 the Nationalist-Labour alliance defeated the rival combination led by Smuts and H. Nationalist-Labour alliance defeated the rival combination leil by Smuts and H. became Prime Minister and minister of native affairs. But he now seemed to have abandoned secession though he declared that the sole link letween the Dominions and Great Britain was the personal bond of a common king—a declaration which he signed at the Imperial Conference of 1926. His chief concern in office was now to advance the controversial policy of 'segregation' of the natives and to this period belongs the Nationalist determination to climinate the Union Jack as the national flag of S. Africa. In 1929 he was returned again with a small majority over all other parties and in 1930 attended the Imperial Conference of that year, declaring on his return that he had now 'done with a republic and republicanism.' He was again in London for the celebration of the sliver jubilee of King George V. In 193; as leader of the Nationalists, he joined forces with Gen. Smuts, leader of the S. African Party, to form a United Party, and his utterances gave the impression that he would stand with the empire in the event of war; but in 1939, when war broke out, H., as Prime Minister, declared for neutrality. He was, however, defeated on a vote of confidence and resigned in favour of Smuts. From that moment his career waned. He now, however, fested on a vote of confidence and resigned in favour of Smuts. From that moment his career waned. He now, however, tried to justify Nazi policy and called on Smuts, in 1940, to withdraw from the war and make a separate peace. This aroused great anger in S. Africa and in Nov., 1910, he resigned from the 'reunited' Nationalist Party a year after he had formed it with Dr. Malan, the new Nationalist leader and an avowed republican, and then resigned his seat in Parliament. At a meeting of the Afrikaner Party in Johannesburg in 1941 he stated that National Socialism was the only solution of S. Africa's economic and political problems, but Havenga, leader of the Afrikaner Party, opposed his view and there was an open break between the two men which finally ended his career. two men which finally ended his career. In spite of his later support of the Brit. Commonwealth and the favourable in pression he made at the Imperial Conferences of 1926 and 1930 it was always obvious that his anti-Brit. sentiment was

obvious that his anti-Brit. sentiment was never far below the surface. It is a curious commentary on his prejudices that he sent one of his three sons to Oxford Univ. See lives by L. E. Neame, 1930, and C. M. Van der Hoever, 1946.

Heruli, Teutonic tribe, first mentioned in the reign of Gallienus (260-68), when they joined the Goths in ravaging the Ægean coasts. In the sixth century they formed an alliance with Theodoric the Ostrogoth against Clovis, king of the Franks, but were overthrown by the Langobardi.

Hervieu, Paul Ernest (1857-1915), Fr. novellst and dramatist, b. at Neuilly (Seine). He was called to the Bar in 1877, and qualified for the diplomatic scruice. His best work is found in a scries of plays, including: Point de Lendemann (1890), Les Panoles Resient (Vaudeville, 1892), Les Tenaulles (Comédie Française, 1895), La Course du Flumbeau (1901), L'Enigme (1901), Théroigne de Méricourt (1902), Le Dédaie (1903), Le Réveil (1905), Connais-loi (1909). Elected to the Fr. Academy in 1900.

Herwarth von Bittenfeld, Karl Eberhard (1796-1884), Prussian general, b. at Grosswerther in Thuringia. He entered the Guard Infantry in 1811, and served through the war of Liberation (1813-15), distinguishing himself at Lutzen and Paris. In 1864 in the Schleswig-Holstein cam-

In 1864 in the Schleswig-Holstein campaign he attained great fame through his daring capture of the Isle of Alsen. In 1866 he commanded the 'Army of the Fibe,' which overran Saxony and invaded Bohemia. He took a leading part in the brilliant victories over the Austrians at Hubnerwasser, Munchengratz and Koniggratz. On the outbreak of the Franco-Prussian war in 1870 he was appointed to organise the reserve forces in the Rhine prov. and in 1871 was promoted to the rank of field-marshal.

Herwegh, Georg (1817-75), Ger. lyric poet, b. at Stuttgart. Originally intended for the church, he went to the univ. of Tubingen, from which he was expelled in 1336, and he then took up journalism.
During his term of military service insubordination resulted in his fleeing to
Switzerland, where he pub, the book of
political poems that, although it was conpointed poems that, atthough it was con-fiscated, made him famous, Gedichte emes Lebendigen (1841). He pub. a second vol. of poems, which like the first was conhecated, and trans. Lamartine's works and sev. of Shakespeare's plays into Ger. into Ger.

Herzegovina, see Bosnia and Heryf-GOVINA.

or Gerzen, Alexander (1812-Herzen, 1870), Russian author and publisher, b. at Moscow. In 1840 he held an official post, but in consequence of too great frankness but in consequence of too great frankness he was sent to Novgorod in 1824, and left Russia in 1847 to pass the remainder of his life between Paris, London, and Geneva. In London he estab, his Free Russian Press, from which emanated a large number of works dealing with the cause of reform in Russia. He wrote Mémoires de l'Impératrice Cathérins II. (1869), and some novels, as well as his political works, His collected Russian works were pub. at Geneva in 1870. See M. Wiedemann, Hersen und der Kolokol, 1935. 1935.

1935.
Herzl, Theodor (1860–1904), founder of modern political Zionism (q.v.), b. at Hudapest. Most of his life was passed at Vienua, where in addition to his fame as a Jewish Nationalist, he also had a high reputation as a journalist and dramatist. His great ideal was to restore the Jewish nation to political autonomy. He treated the subject from an entirely secular standnoint, and did not at first bring Palestine point, and did not at first bring Palestine

Halle, and from there went on to Erlangen as prof. of church hist. (1854). His most famous work was the Itealencyklopadae fur protestantische Theologie und Kirche (1853–68, 22 vols.). In 1877 he commenced a second ed. in conjunction with G. L. Plitt, and on the death of the latter in 1880 Albert Hauck took his place, and after the death of II. pub. a third ed. (1896–1909). His other works include Johann Calvin (1813), Leben Okolampads (1843), Die romanischen Waldenser (1853), and Abriss der gesamten Kirchengeschichte (3 vols., 1876–82, 2nd ed., 1890–92).

Heseltine, Philip, see Warlock, Peter.

Heshbon (Modern Hesban), chief city of Schon, king of the Amorites, captured by the Israelites on their way to the Jordan (Num. xxi.). Its site is on a plateau in the N.E. corner of the Dead Sea, on a trib. of

the Jordan in Truns-Jordania.

Hesiod, or Hesiodus (f. eighth century B.c.), earliest didactic poet of anct. Greece. B.O.), carliest didactic poet of anct. Greece. He was b. at As ra, a vil. at the foot of Mt. Helicon, and was the son of a shephord. On the death of his father, he and his brother Perses had a law-sult over the patrimony, which the latter won by bribery, whereupon II. left his native place for Naupactus. His brother, who had wasted his substance, now applied to him for help. This incident is recorded in Ris against poem. Works and Days, half for help. This incident is recorded in H.'s earliest poem, Works and Days, half of which contains good advice given to his erring brother, enforcing honest labour the rest of the poom deals with lucky and unlucky days for rural work. The poom The rest of the poem coals with micky and unlucky days for rural work. The poem contains a beautiful description of winter and the earliest fable in Gk, literature of which we have any knowledge, 'The Hawk and the Nightingale.' In this poem, too, H. relates how at some funeral games the state of the sta at Chalcis in Eubora he won in a contest of ong a tripod, which he dedicated to the Muses. The other poem attributed to H. is Theogony. It is a hist, of the creation of the world—the carth, hell, ocean, night, sun and moon, and a hist, and genealogy of the gods, originating in Zeus and Cronus The authenticity of the poem was first doubted by Pausanias (A.D. 200); it is now generally accepted that it is the work of H., or of a disciple, and that it contains intermediations have a little work of the contains and the state of the contains and the contai doubted by Pausanias (A.D. 200): it is now generally accepted that it is the work of H., or of a disciple, and that it contains interpolations by a later hand. The Shield of Heracles, once thought to be H.'s, is probably spurious. It is a description of the expedition of Heracles and Iolaus and Iolaus against Cycnus, and obviously owes much

into his calculations, though his ultimate aim was to estab. the Jewish people as a harding in Palestino. He pub. his famons pamphlet, Der Judenstand, in 1869, in which he set forth this ideal. See life by J. de Hass, 1927.

Herzog, Emile, see Maurois, André.
Herzog, Johann Jakob (1805–82), Ger.
Protestant theologian, b. at Basie. In 1847 he was appointed prof. of theology at Halle, and from there went on to Erlangen Teachers of Greece, 1908, and O. Gigon, Der Ursprung der griechischen Philosophie, 1915.

Hesione, daughter of Laomedon, king of Troy, who exposed her to a sea-monster, according to an ann. custom, to appease the wrath of Apollo and Poseidon. Heracles rescued her from the rock to which she was chained and slew the monster, claiming, as his reward, the horses given to Laomedon by Zeus. Laomedon refused to fulfil his promise and was slain by Heracles, who took Troy and gave H. to Telamon.

Hespeler, vil. of Waterloo co., Ontario, Canada, 12 m. S.E. of Berlin. It is a rved by the Canadian National Railway. It has woollen, flour and saw mills, and manufa, furniture and implements. Pop.

manufa, furniture and implements. 3000.

Hesperia, see HESPFRUS.
Hesperides, in Gk. mythology, the mandens who guarded the golden apples which Earth gave to Hera on her marriage with Zeus. Their numbers and genealogy vary in different accounts, but they are usually supposed to be three in number, and to be the daughters of Hesperus. Acand to be the daughters of Hesperus. According to Hesiod their dwelling-place was for away to the W. on the borders of the ocean, but Apollodorus places their garden near Mt. Atlas. For the account of how Heracles outwitted the H. with their fellow guardian, the drugon Ladon, and gathered the apples, see Heracles see also J. C. Lawson, Modern Greek Folklore and Ancient Greek Religion, 1910.

Hesperornis (Gk. 1000, 1910.

H

Upper Cretaceous strata of Kansas; they were marine diving birds of considerable size, with rudimentar; wings, and a broad tail of moderate length; the sternum is broad and flat and without keel; the head small, with elongated laws furnished with recurved teeth set in grooves. H. regals stands about 3 ft. high, and H. crassipes is an even larger species. species.

Hesperus (Lat. Vesper), Gk. name for Venus as the evening star. Although originally they were regarded as two distinct personalities. H. was very early identified with Phosphorus (Lat. Lucifer), the morning star. The Gk. poets called Italy 'Hesperus,' and later writers extended the name to Spain.

Force where he obtained a commission. His father's business being ruined, he had no occupation after the war and drifted to a mystical anti-benitic association called 'Thule,' whose badge was the swastika and whose radical views were those of Houston Stewart Chamberlain. When the association was suppressed by when the association was suppressed by
the Munich communist revolutionaries,
H. barely occaped with his life. In the
toilowing winter he heard, by mere chance,
a passionate speech by Hitler in denunciation of the Versailles Treaty and became
an ard int convert to National Socialism.
He soon became the close friend and condidn't of littler and accompanied him in fidant of littler and accompanied him in the abortive 'nutsch' in Munich (1923), shaning imprisonment with Hittler in Landsherg am Lech fortress. Being an educated man and of calm and self-con-trolled temperament be exercised great troll d temperament be exercised great influence over the neurotic littler, particularly in the latter's periods of deepest dejection. It was H who inspired the production, though not the content, of Mein Kampf and at Landsberg much of the work was dictated to him by Hitler. In 1928 Hitler made him his private secretary. In 1932 II who had been appointed chairman of the Central Political Bureau of the Nazi Party, was made Deputy Leader and, logically, he is apparent to Hitler. As such, he was consulted on most matters of foreign and sulted on most matters of foreign and domestic policy and probably his advice had some restraining influence on the exhad some restraining influence on the excited nerves of his loader. But it seems that he was never allowed to go on un nortant missions and when important developments took Hitler out of the cap H. was left behind, for it was his loyalty rather than any special ability that Hitler exploited. Rolations between the two men were evidently normal as late as May 4, 1941 when H. sat beside Hitler in the Rolchstag seesion of that date. But on May 13 came the astonishing news that H. had flown in an aeroplane to Scotland, landing near Glassow by parachute and breaking an aniele In a long interview with Lord Simon (then Lord Chancellor) H. put before him six proposals Germany to be given a free hand in kurope, Britain to have a free hand in the Empire, except to the return of the funer Ger colonies, Russia was to be included in Asia, but Germany had certain demands to make of Russia, which would have to be actuated by negotiation or as a result of war. (H claimed that there was no truth war. (It claimed that there was no truth in rumours that Hitler contemplated an early attack on the Soviet Union, which, however, was invaded 5 weigh later) Britain was to evacuate Iraq, the peace agreement was to provide for reciprocal indemnification of Brit, and Ger nationals whose property had been expropriated as whose property had been exproperated as a result of the war, and the peace proposals were to be valid only if negotiated by a Brit Gov. other than the existing one (Mr (harchill's) The information given by H to Lord Simon repeated what he had already told the duke of Hamilton (near whose house be came down) and Sir Ivone Kirkpetrick, of the what he had already told the duke of Hazmilton (near whose house be came down) and Sir Ivone Kirkpatrick, of the Foreign Office. Hence the transcript of Hesse-Darmstadt, state of W Germany;

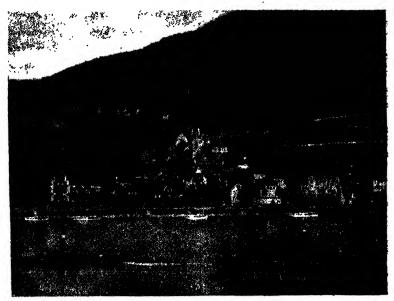

the interview with Lord Simon did not form any part of the case against H before the War Crimes Tribunal, which was based on the records of the earlier interviews. H was found guilty at the Nuremberg trial and sentenced to life imprisonment During the trial he had feigned madness for a long period but afterwards abandoned the pose See J. Rawlings, The Case of Rud light Hees, 1947. Hesse, Hermann (h 1877). Ger novelist, essay ist and poct, b at cals in Wirtenberg His father and grandfather were missionaries in India. hossen and E. Starkenburg are mountainous in character, the former having officer of the army of occupation, but most the Vogelsgebirge (chief peak Taufstein, of them were recovered in Chicago. 2530 ft.), and the latter, the Odenwald (chief peak Melibocus, 1700 ft.). W. 2530 ft.), and the latter, the Odenwald (chief peak Melihocus, 1700 ft.). W. Starkenburg is quite lovel, forming part of the Rhine plain. The Rhine is the prin. riv., all the others, save those rising to the N. and E. of the Vogelsgobirge, which flow into the Weger, being tribs. There are no large lakes, but mineral springs are found at Nauheim and elsewhere. Deer, foxes, and wild swine are among the fauna. The prin. industry is agriculture; wine is one of the chief natural produced in

Hesse-Nassau., former prov. of Prussia, situated between the Rs. Rhine and veser is now incorporated in H. The surface is res now incorporated in it. The surface is very mountainous, the chief ranges being Taunus (highest point 2896 ft.), Westerwald, Rhongebirro (highest point 3115 ft.), and the Hessian Mis. All its rivs. are tribs, of the Rhine and Weser. Agriculture and early and the surface and weser. rnere are no large lakes, but mineral trips of the Rhine and Weser. Agricularity are found at Nauheim and else-ture and cattle-rearing are carried on and where. Deer, foxes, and wild swine are among the fauna. The prin. industry is agriculture; wine is one of the chief considerable mineral produces, being produced in the Rheingau, notably at Rudesheim, and the sold at the W. slopes of the Odenwald. The brine springs of Wiesbaden and the sodablearbonate springs of Ems being famous; and excellent wines are produced in the and excellent wines are produced in the Rheingau. The prin manufs are machin-ery, pottery, leather goods, iron ware, chems, and textiles, which are carried on at Kassel, Diez, Eschwege, Frankfort, Fulds, Gross Almerode, Hanau, and Hers-

Fulda, Gross Almerodo, Hanau, and Hersfeld. Other tns. of importance are Wiesbaden, Homburg, and Marburg, which is the seat of a univ. The prov. was formed in 1867-68 out of the ters. of the duchy of Nassau, the landgraviate of Hesse-Homburg, the electorate of Hesse, and the ter. of Frankfort, etc.

The area of H. is 7,931 sq. m. and the pop. 4,064,000. Cap. Wiesbaden.

Hesse-Homburg, former landgraviate of Germany, composed of Homburg-vorder-Hohe on the r. b. and Meisenheim on the 1 b. of the Rhine, with a total area of 106 sq. m. The former dist. is now part of Hesse, and the latter of Rhineland-Palatinate. H. was constituted a landgraviate in 1596 by Francis I., son of George I. of Hesse-Darmstadt. It was incorporated with latter duchy from 1806 incorporated with latter duchy from 1806 to 1815, and again in 1866. Later in the same year it was annexed to Prussia.

Hesse-Kassel, or Electoral Hesse (Ger. Kurhessen), was until 1866 an electorate of Germany, but now forms part of Hesse, having been until 1916 a gov. dist. of the Prussian prov. of Hosse-Nassau. (See article on the latter for particulars as to configuration. products, etc.). When article on the latter for particulars as to configuration, products, etc.). When Philip the Magnanimous died in 1567, he left hair of Hesse, with Kassel as cap, to his eldest son, Wm. IV., 'The Wise.' A large part of Schaumburg and other land was added after the Thirty Years war. In 1803 (under Landgrave Wm. IX.) H. was constituted an electorate, the coveragen hearing the fille of electoral IX.) H. was constituted an electorate, the sovereign bearing the title of electoral prince of Hesse. In 1807, however, nearly all the ters. of H. were transferred to Westphalia, but were recovered in 1813. As the Elector Frederick Wm. had taken part with Austria in the war of 1866, a Prussian army entered his dominions, and they were annexed to Prussia in sept. of the same year.

Hessenes, see ESSEVES. Hesse-Rotenburg, former landgraviate of Germany, which was founded in 1627 by Ernest, the younger son of the landgrave Maurice of Hesse-Kassel. On his death in 1693, his two sons inherited it, but in 1700 they divided the ter. and founded the families of Hosse-Rotenburg and Hesse-Wanfried. The latter died out and the two were rounted in 1755. In 1801 part of the landgraviate was ceded to France, in 1813 some of the remainder to Prussia, and on the death of the Land-grave Victor Amadeus in 1834, what re-mained was re-united to Hesse-Kassel.

For the lineage, exploits, and hist of the houses of Hesse, see Hoffmeister, Historisch-genealogisches Haudbuch über alle Linien des Regentenhauses Hesse, 1874; and Walther, Literarische Handbuch für Geschichte und Landeskunde von Hesse,

1821 and 1858.

Hessian-fly, or Cecidomyria destructor, name of a species of dipterous insects belonging to the family Cecidomylidae;

they are minute fragile flies, having very few wing nervures; the elongated anten-ne are furnished with rings of hairs. This fly does great injury to crops, and in some parts of the world causes considerable loss when it has once attacked cereals; the larve is lodged at a point in the stem of the wheat enfolded by a leaf; the stem consequently weakens and bonds. When the larve the larve of the destruction about to pupate, the larva of *U. destructor* exude- a substance from its skin and this torins a remarkable cocoon, which is called flax-secd.

Hess's Law, in chem., states that the total absorption or evolution of heat in a given chemical reaction is uninfluenced by the number of stages in which the reaction is brought about. The law was first formulated in 1840 by the Russian chemist,

G. II. Hess

Hestia (the fire goddess), daughter of Cronos and Rhea, one of the twelve chief delties in Gk. mythology. She was the goddess of the hearth and home, the personification of family life; and, by extension of the idea of family life to the nation, she was the goddess of the state. In this character her sanctuary was in the prytaneum, where the central fire of every th, and state was kept perpetually burn-ing, and where the magistrates, as fathers of the state, held their meetings. If by any accident this fire was extinguished it might not be rekindled by ordinary are, but only by the sun's rays or by friction, Apollo and Possidon both sought the hand of H., but she took a vow of porpetual cellbacy, and thereafter Zeus made her the presiding delty over all sacrifices. Intouding colonists took some of the sacred fire with them to be kindled on the hearth of their new colony. He sacred hre with them to be kindled on the hearth of their new colony. H. is identified with the Rom. Vesta (q.v.). See T. Allen and E. Sikes (ed.), Homeric Hymns, xxix., 1904, and L. Farnell, Culls of the Greek States, v., 1909.

Heston and Isleworth, urb. dist. in the co.

of Middlesex, England. It is a residential suburb of London, 12 m. S.W. of St. Paul's. Pop. 88,000.

Hesychasis, known also by the sobriquet

of Omphalopsychoi, were a sect of the Gk. Church which arose during the fourteenth century. The sect was a mystic one, its practice being based on the theory that a divine light was hidden in the soul, which was believed to be situated in the stomach. By contemplation at stated times the H. endeavoured to draw out this light. They died out very quickly. See monograph by

F. J. Stein, 1874.

Hesychius, Gk. grammarian of Alexandria of the fifth century A.D. Hiskerion of Gk. words and phrases, with explanations of customs, usages, etc., is of the transfer mules carriedly in wars of of the utmost value, especially in regard to rare words as used by writers like Ægerlylus. In the only MS., now in Venice, which survives, there are large interpolations by later Christian writers. H. hased his work on that of Diogenianus.

See M. Schmidt, 1868.

Hesychius of Miletus, 'Illustrious,' Gk.

chronicler of the fifth century A.D. His
hist, of the reign of Justin I. and of
Justinian is lost; of his universal hist. an

extremely valuable fragment, giving the hist. of Byzantium (Constantinople) down to the reign of Constantine the Great, survives. His biographical dictionary

survives. His biographical dictionary remains in an opitome of Suidas. See J. Oralli, 1820, and J. Flach, 1882.

Heterre, or Hetairai, name usually applied in anct. Greece to the best class of courtesan. The education of Gk. women was almost entirely neglected, but the H. were among the most beautiful, accomplished, and intellectual of Gk. women. They were nearly all trained to play the eithera or the flute, and to dance: play the cithera or the flute, and to dance : Lasthenia studied philosophy under Plato, Leontion was a pupil of Epicurus, while Aspasia, the mistress of Pericles, and perhaps the most famous of all the Gk. courtesans was one of the first advocates of woman's rights to education and cul-ture, and the friend of Socrates. Other famous H. were Phryne, the mistress and model of Phulias, Lais, Pythionice, and Theodote. Most of these lived in Athens; but Corinth was even more famous for the number, beauty, and refinement of its II. See P. van Limburg-Brouwer, Ilis-

11. See P. Van Limburg-Brouwer, 1718: toire de la civilisation morale et religieuse des Grecs, 1833-12; W. Plankl (ed.), Hetdron-Briefe (Gk. and Ger.), 1925.

Hewlett, Maurice Henry (1861-1923)

Hewlett, Maurice Henry (1861-1923) Ing novellst and poet, eldest son of Henry Gav H. (f Shaw Hill, Addington hat I ducated at Isleworth He was called to the Bu an i entered the cham colled to the 13 st and effered the chimic of a prosperous consin He then sin ecded his father in a respectable post in the Land Record dept. of the Woods and Forests, 1890-1900. His first literary with was Lantau rik out of Luscany with with the Hayle of Dead I trending (in ver. (, 1890). His first trouble safets was gained by his first copular success was guned by his inst topulir success was guided by his building, passionate romance, the Korest I sers (1898), full of the colour of early methotal romance. This was so great a success that within three years. It had more a sufficient fortune to be able to quit be Land Revenue dept. In the internin he had pub. Kichard Lea and Nay (Richard Courr de Lion 1900) an historical novel, which also had proved externely popular. He then with to stay at Whittinghame with Arthur Isaliour in or feet to collect material for his next orice to collect material for his next or act to conect material for ms next a mess novel, he que n « Quarr (Mary Que n of scots, 1904) A somantic, but net sentimental, if his great integraty and a sons of purp so and the se qualities led him in later life to y in the Lublan Switty and to Listing come tions with tle Quakers However just his claim to b i poet it is as a novelist that he must be judge I and in his novels he is always se isitive and poetical, compassionate and st diast. There is a living uprightness ii I implicity throughout all hi stylised fury tale buckground which both illumine in reducin the artificiality. The interesting fact about his I arest I need in that it was such a striking success in an age which was essentially mid rialistic and, that's, because of that viry materialism But he never quite reported that success with his other works in this kines, such a 1 tile Nomis in Ital (1891), The New entriumy Inics (1901) and Road in Irany (1909) by the I ool Lirany (1909) and Renny's River (1911), which fellowed his casays in the field of historical noming the essays in the fact of instored in the control he returned to his ineditival ion ance. The Stooping Lady (1907), he Harrow (1910), Half vay House (1912), and other novels, deal with more modern times. It might seem that John Senhouse the character in hest Harrow whom H m delled on himself was the poet and

and Wiltshire Essays (1922). He also wrote a novel, with the incomprehensible title of Bendish, which has certain obvious likenesses to the Byron-Shelley episode, Bendish being Byron and the period that of the first Reform Bill. The present generation neglects H., and his Edwardian best-sellers, but there is still to be found in them something both significant and stimulating. See L. Binyon (ed.), Letters, to which is added a Diary in Greece, 1914, 1926.

Hexachord, term used originally in Gk. music for a diatonic series of six tones, or for the interval of a major sixth. It was also applied to an instrument having six strings. In medieval music, it referred to

a diatonic series of six tones containing four whole steps and one half step.

Hexagon ('ik. ¿, six, and you'o, angle), in mathematics a figure containing six angles and bounded by six sides. If these are equal the figure is shown as a regular H. Hexagonal construction gives a body

the greatest possible amount of strength and stability, and doubtless for this cause is the one adopted by bees for making their cells. Pascal's theorem with reference to the H. is important. It states that if a H. be inscribed in a conic section the points of intersection of the pairs of sides (i.e. 1 and 4, 2 and 5, 3 and 6), produced, lie on a straight line.

Hexabydroxycyclohexane, see INOSITE Hexamoter, form or verse used by the Gks. and Luts. for epic and herore poems. is perhaps the most important of classical metres. The Odyssey and the Iliad alone among Ok. productions would have surfaced to make it famous, while the greatest example of its use in Lat. is in the . Encid. Though both the Gk. and Lat. forms of the H. are based on the same plan, it is necessary to differentiate slightly between them. The normal line in both, however, consists of six dactylic ft., of which the last is catalectic. With a line of this type the Odyssey opens:

occur in every line, in the third and fourth ft. In Gk. a single weak casura (i.e. after the second syllable of the dactyl) is sufficient, but in Lat. it is common to find a strong casura (i.e. after the first syllable of the dactyl) in the third foot, and a weak cesura in the fourth, or vice versa. Thus, cesura in the fourth, or vice versa. for example, in the line from Ovid,

'āddēquod | ingēnu | ās didi | cissē fi | dēlitēr | ārtis,'

the strong cesura occurs in the third foot after ingenues, the weak coesura in the fourth foot after didicisse. Lines with only a weak coesura are very rare except in the earlier poets.

Hexamine, Hexamethylenetetramine (Cile), No. is a white solid obtained by the action of formaldehyde upon ammonia. It is used in medicine, under the name of II., or of urotropine, in certain diseases of

It is used.

It, or of urotropine, in certain the urinary organs.

Hexane, an important constituent of petrol, especially of the solvent called petroleum—ether or ligroin. The formula is C,H,4 and sev. isomeric compounds can exist, but only the normal H. is important. It is a colorriess liquid, sp. gr. 0.6603 at 20°, insoluble in water. It can be made synthetically by heating propyl iodide with sodium. In its chemical, included with sodium.

Hexapla, ed. of the O.T. and version in parallel columns prepared in the second century by the famous Alexandrian scholar, Origen. It consisted of the Heb, a transliteration of the Heb, in Gk, char-acters, an amended Septuagint version and three other versions by the scholars Aquila, Symmachus, and Theodotion. The work has survived only in a few fragments (ed. by D. and F. Field in Origens Hexaplorum quae supersunt) but these are invaluable to critics and students of the OT. It contains, indeed, almost all that remains of the Gk. versions other than the Septnagint.

Hexateuch, name now generally used to denote the first six books of the O.T., which modern criticism shows must be regarded as a literary entity. The name is comed on analogy with Pestateuch, which title was early used by Origin and Tertulian for the books of Geneds, Exodus, Leviticus, Numbers, and Deuteronomy. During the first eighteen centuries of the Christian era, the tradition of the Mosaic authorship of the Peutateuch was almost universally received, but such a tradition was bound to vanish before the first appearance of the light of criticism. In ανδρα μοι | είνεπε | Μολόα πολ | ύπροτω | thurd person; and in Deut. xxxiv. 10, it is sind that 'there are one a prophet since m Israel like unto Moses,' while the account of Moses,' death in which this frequent. Spondess may occur in any or every foot, though a line composed entirely of spondees is rare in Gk., and in Lat. still rarer and more barbarous. Thus it is only in an early poet such as Ennius that such a line could occur as:

| Olli | rēspēn|dit rēx | Ālbāļī lön|gāl | One or two cæsuras (breaks in a foot) | footometric prophet since on the prophet himself. There are similar objections immediately apparent to the book which bears his name. A more detailed examination of the Pestatewch led to the discovery of a great number of repetitions, discrepancies, and contradictions, and these led to the further continuous contradictions. many places Moses is spoken of in the

clusion that no one of these books was the work of a single hand. The most notable of the repetitions is in the accounts of the Creation. The account given in Gon. ii. spiritually, and its pleading for reform. Its style is clearly marked, D was inserted immediately precedes it. The first step into JE, and then the combined narrative Creation. The account given in Gon. il. 4 f. differs irreconcilably from that which immediately precedes it. The first step in its solution was made by a Fr. scientist, in its solution was inade by a Fr. scientist, Jean Astruc, who, being guided by the fact that in the early narrative of the Creation the name used for God is Előhim, while in the second it is Yahweh, divided the book of Genesis into two main divs. or sources. But as criticism moved on to the rest of the Pentateuch, results became far less positive. The clear guidance of the Divine names was no longer to be had, and at first it seemed that the rest of the Pentateuch was a mere disorderly collec-Pentateuch was a mere disorderly collec-tion of fragments with little or nothing in common. This Fragment Hypothesis owes its origin to the Scotsman, Gedder, and was supported by Vater. W. M. De Wette in his Dissertatio Critica (1805) wette in his Dissertatio Critica (1805) irrst propounded the now generally accepted theory that Deuteronomy, instead of being the oldest of the Pentateuchal books, is, in reality, the latest, probably being no earlier than the reign of King Josiah. But, a new and more constructive school of criticism was arising wader the leadership of High Evald and constructive school of criticium was arising under the leadership of Bleek, Ewald, and Hitzig, to whom we owe the Supplement Hypothesis, and to this school, which rapidly superseded the older one, De Wette himself later turned. Here the connection between the Elohist of Genesis and parts of the later books was first clearly seen and this led to the conclusion that to seen, and this led to the conclusion that to the Elohist writer was due the Grund-schrift or foundation which the Yahwist had used as the basis of the final redaction. This view was attacked by Hupfeld in 1853. Hupfeld distinguished two Elo-histic sources which he assumed were quite separate both from each other and the Yahwist source. Noldeke showed in detail how the Elohist source was the Grundschrift of all the Hexateuchal books except Deuteronomy. These views, how-ever, have all given way before the now generally received Graf-Wellhausen Hypogenerally received Graf-Wellhausen Hypothesis, which finds in the H. four main strata. These are known as: (1) P, the Priestly Document, or book of the four covenants (Wellhausen's Q), the work of the so-called older Elohist, which forms the framework; (2) E, the (second) Elohistic document; (3) J, the Yahwist source, and (4) D, the Deuteronomist The chief feature of Graf's hypothesis is the alteration in the position of P. This had hitherto been considered the oldest of the documents, but Graf placed it attor D, and later critics have endorsed his view. It is now realised that the legal and ritual religion which he seeks to codify ritual religion which he seeks to colify streets and a mrkt. sq., and is famous for came after and not before the prophetic the anct. abbey church of St. Andrew, and lyrical Yahwistic conceptions. J is the earliest of the four, but J and E have been wrought so skiffully into a single connected narrative, that it is almost impossible to consider them separately. The tains a fine perpendicular roodscreen of result of their union is known as JE. It is impossible here to show the clear distinction between the E and J portions. D hall and the manor office, two castellated either is or contains the book of the law towers of the fourteenth century, are also

was litted into the framework provided was itteed into the framework provided by P. This last work, the priestly code, differs widely in spirit from the earlier works. It is historical and legislative, dealing with ceremonial regulations and the ordering of the feasts. It formed the framework in which the other three documents were written with the other three documents. framework in which the other three docu-ments were united. Dr. C. A. Simpson in a recent 'critical analysis of the pre-deuteronomic narrative' of the H. ex-amines certain hypotheses advanced by Eduard Moyer, who himself started from positions laid down by Wellhausen. The essential points are: first, the critical analysis should begin not with the book of Genesis but with the accounts of the of Genesis but with the accounts of the canaan; second, that the original tradi-tion of the exodus described a journey from the sea to Kadesh, which became the centre of the Israelites' wilderness life; and that this original tradition had nie; and that this original tradition had nothing to say about a visit to Sinai or about the law-giving there. Meyer believed that by source analysis he could discover the remains of this primitive accountembedded in the H. Dr. Simpson's investigations have satisfied him of the essential correctness of Meyer's view, but he holds that this earliest document was a much simpler narrative than Meyer had a nuch simpler narrative than Moyer had realised and that while Mcyer was right in thinking that it contained no record of an Israelite mass-journey to Sinai, it may well have once 'told of a pligninage made thither by Moses.' We have in the H. what is in effect the sum-total of the available evidence for the hist. of Israel in this period. If, as in this detailed study, we use our hypothetical reconstruction of the hist. to isolate the primitive traditions, and the primitive traditions to establish our reconstructions of the hist., there is a risk of arguing in circles. If, however, the results of this analysis agree with those given by the independent application of linguistic tests, its soundness will be strengthened. See independent application of linguistic tests, its soundness will be strengthened. See books on the various separate books of the H.; also S. R. Driver, Literature of the Old Testument (6th ed.), 1897; C. F. Dillman, Kurzes Exegetishes Handbuch, 6th ed.), 1892; and C. A. Simpson, The Early Traditions of Israel, 1918; and works by authors mentioned in the text. Hexham, mrkt. tn. of Northumberland, England, situated on the S. bank of the Tune, about 21 m. by rail W. of Newcastle. It is an old th. with narrow streets and a mrkt. sq., and is famous for the anct. abbey church of St. Andrew,

dam, where, as a rule, he lived, although he did visit other countries. His pictures are characterised by their warn colouring and their breadth of treatment, combined at the same time with a minute attention to detail. One of his best pictures is a view of Amsterdam to hall.

view of Amstordam th. hall.

Haydrich, Reinhard (1904-12), Ger.
administrator, b. in Halle; served in the Ger. navy, becoming a favourite pupil of Adm. Canaris, head of the naval intelligence dept. From this he passed into Adn. Canaris, head of the navas meaningence dept. From this he passed into the service of the Nazi party, becoming a member in 1931. Under Himmler's (q.v.) protection his career in the Nazi hierarchy was a swift one, and he soon became an Obergruppenfuhrer of the S.S., with the rank of a general of police. A tier. candidate for the chairmanship of the International Police Commission head his position in the period inwediately the International Police Commission be used his position in the period immediately preceding the Second World War for the purpose of at deping the Ger. espionage service abroad. After the Ger. espionage of Bohemia and Moravia he succeeded you Neuruth as Reich protector in Czechoslovakia (March, 1939). He hastened to shew that his reputation for cruelty was well merited. He distinguished himself by clothing his instructions for the bestial torture of all opponents of the regime in pseudo-scientific formulæ and playing the part of the theoretician who rights in pseudo-article to indice and playing the part of the theoretician who had supplied the doctrine for Nazi practice. In the summer of 1941 he was sent to Norway to assist Quisling to win the Norwagians over to collaboration with the Gers., and, by means of a number of executions and the suppression of what remained of freedom of speech and press, he believed he had placed the security of the Ger, regime in Norway on a firm foundation. Back in Prague he resumed his reign of terror. Between Sept. 28—Nov. 29, 1941, 114 Czech citizens were shot, 55 hanged and 60 others executed in various ways. Ultimately he was shot, 55 hanged and 60 others executed in various ways. Ultimately he was assassinated early in 1942, hundreds of Czechs being murdered by the Gerauthorities in retaliation. It was subsequently ascertained that 3 (Zech parachutists killed H. They volunteered for a suicide mission to rid their country of the 'Protector of Bohemia and Moravia', whe had created a mayors consists. who had started a murder campaign against Czech intellectuals. They were members of the Czech Brigade in England members of the Czech Hrigade in England and were flown to Bohonnia in a Brit. plane. They escaped after ambushing H. and hid in the crypt of a small church, but were betrayed by a Church worker whose nerve broke under torture.

Heytin, or Heytin Peter (1600-62), Eng. writer and divine, b. at Burford in Oxfordshire. He graduated at Oxford and

of interest. At a short distance S. of the Influence of Land became In. Hee the battlefield where the Lancastrians suffered defeat in 1464, and near by are the remains of Dilston Castle where the last earl of Perwentwater was beheaded in 1716. Pop. 10,300.

Havoic Acid, see CAPROIC ACID.
Heyden, Jan van der (1637-1712), Dutch artist, b. at Gorkum. His pictures were principally those of the exteriors of buildings, many of them parts of Amsterdam, where, as a rule, he lived, although the influence of Land became than laptain to Charles I., 1629. He was commonwealth, but at the Restoration was made subdeau of Westminster. His brokes a umber more than fifty, chiefly works number more than fifty, chiefly works number dont outcomed to the High Church party, and wrote Ecclesia windicata: or the Church of buildings, many of them parts of Amsterdam, where, as a rule, he lived, although the influence of Land became than laptain to Charles I., 1629. He was coprived of all eccles. offices during the commonwealth, but at the Restoration was made subdeau of Westminster. His brokesial and controverstal. He belonged to the High Church party, and wrote Ecclesia windicata: or the Church of t (1849).

(1849).

Heyn, Piet (1578-1629), Dutch admiral, b. at Delfshaven. He was taken prisoner by the Spaniards, and afterwards gained victories over them in 1624, and in Brazil in 1626. In 1628 he was successful in capturing the Sp. fleet carrying silver valued at a considerable amount. He met his death in a fight against the pirates of lumbirs.

of Dunkirk.

of Dunkirk.

Heyne, Christian Gottlob (1729–1812), Ger. classical scholar, b. at Chemnitz in Upper Saxony. Although very poor, he was a student at Leipzig Univ., and in 1753 obtained a post in the Britil Library, Dreeden. His ed. of Tibullus, which appeared in 1755, secured him the support of Ruhnken of Leyden, and although he suffered many vicissitudes during the Seven Years war, the latter was instrumental in obtaining for him, in 1763, an appointment as prof. at Göttingen. His other works include eds. of the Enchiration of Epictetus; Virgil, 1767; Homer, Pludar, and Apollodorus, as well as many reviews of books. See life by Ludwig Heeren, 1813.

Heyse, Paul (1830–1914), Ger. author; b. in Berlin; son of a prof. of philology, aducated: Berlin; Bonn. In 1854 he was one of the authors invited by Maximilian of Bayaria to take up his abode in

milian of Bavaria to take up his abode in Munich. He excelled particularly as a writer of short stories, all of which are true pictures of life enhanced by humour. true pictures of life enhanced by humour, by judicious power of rendering detail, and by a graceful style. He wrote some novels and a number of peems. Among his works are: Thekla (1858), a poem; he Kinder der Wedt (1873); Das Buch der Preundschaft (1883), a collection of stories; Maria von Magdala (1899), and her Heilige (1902), both of which are dramas. See G. Kemmerich, Heyse als lumanae-heitifell. 1928

trainas. See G. Reinnerich, Heyse as tomanschriftsteller, 1928.

Heysham, th. and port in the co. of Lancashire, England. It is situated about i m. S.W. of Lancaster, and has since 1904 been used by the London Midland Region rallway in connection with steamboat services to the Isle of Man and Ireland. Pan 7,000. Pop. 7000.

Heyst, watering place in the prov. of W. Flanders, Belgium. It thes about 9 m. N.E. of Bruges, with which it is connected by a steam tramway and by rail. The tn. is attractive and possesses a picturesque harbour. During the First World War the sandbanks of H. held an important

chems. It has also brass and iron foundries, and coal mines. Pop. 25,000, Haywood, John (c. 1497-c. 1580), Eng. author, b. probably in London. He seems to have been introduced at court by Sir Thomas More, and to have been a favourite in the time of Henry VIII., Edward VI. and Mary, on account of his ready wit and skill in music. When Elizabeth ascended the throne, however, he retired to Malines. He is chiefly remembered as the writer of interludes, which differed from those of interludes, which differed from those of his predecessors in having real persons substituted for qualities personified, thus forming a link with the modern drama. He also excelled as a writer of epigrams. Among his works are: A Mery Play between the Pardoner and the Frere, the Curate and Neybour Pratie (1533). The Play of the Wether (1533). The Four Ps., (15451). See P. W. Pollard, A Critical Essay, 1903; T. S. Graves, On the Reputation of John Heyrood, 1923; R. W. Bolwell, The Life and Works of John Heyrood, 1922.

Heywood, Thomas (c. 1775—c. 1850)

Heywood, Thomas (c. 1775-c. 1650), Eng. dramatist, was a native of Lincolnshire, and a student at Cambridge. In 1596 he had begun his career as a playwright, and in 1598 was an actor in Henslowe's company. He was a prolific writer, for seventeen years before his death he claims to have written about His dramas deal with ordinary 200 plays. His dramas deal with ordinary domestic life and with adventure, and in domestic life and with adventure, and in addition to these his works comprise pageants, elegies, and poems. Among his writings are "A Woman killed unth Kindness (1603), The Fair Maid of the West (1631), The English Traveller (1633), while among his other writings are: Trotal English (1638), while among his other writings are: Trotal English (1638), while among his other writings are: Trotal Compressions (1600), and the following the states. while among his other writings are: Troid Britanica (1609) and An Apology for Actors (1612). See J. A. Symonds in an Introduction to Thomas Heywood, 1903; P. Aronstein, Thomas Heywood, 1913; A. M. Clark, Thomas Heywood as a Critic, 1922; L. B. Wright, Heywood and the Popularising of History, 1928

Hezekiah (Heb. Hizkujāhā, 'Jehovah hath strengthened'), king of Judah, the son and successor of Ahaz, with whose reign his own provides a most favourable contrast. He was young when he as-

reign his own provides a nost favourable contrast. He was young when he ascended the throno (c. 715 or c. 720 B.C.), and the early part of his reign was doubtless spent under a regency. The king was personally intimate with the great prophet Isaiah, and it may well have been to his influence that Hezekiah's reforming zeal was due. But the reign is memorable for great deeds without, as well as for reform within. The Assyrian overlordship was rejected, and in the second of the two expeditions sent to reinstate it. Israel won a

iron 25, 1854, finished March 28, 1855, and 000, pub. Nov. 1856) has long held its place as the classic of Algonkin legend. The scene of the poem is among the Ojibways on Lake Superior between the Pictured Rocks and the Grand Sable. Perhaps the best account of the legendary H. is that to be found in H. Schoolcraft's Algic Researches (1839), the author having married a half-breed wife. The Iroquois form of the H. tradition is to be found in the same author's History, Condition and Prospects of the Indian Tribes of the United States (1851-57). In these we learn that H. was supposed to have been sent among the N. Amer. Indians to clear their rivs.,

the N. Amer. Indians to clear their rivs., forests and fishing grounds, and to teach them the arts of peace; and that he was variously known as Michabou, Chiabo, Manabozo, Tarenyawagou, and Hiawatha. Hibbert Lectures are a course of lectures first begun in 1878. They were instituted by the tiustees of a Jamaica merchant, Robert Hibbert (1770-1849), who loft money for the founding of scholarships, cartioularly for Unitarius. Until the particularly for Unitarians. Until the year 187' the money was used solely for this purpose, but in that year the trustees decided to begin the lectures for the pur-pose of discussing, and if possible settling.

pose of discussing, and if possible settling, doubtful points of religion, quite apart from any sect. The first series was given by Prof. Max Muller, and since then the lectures have included Renouf, Renan, Kuenen, Beard, Reville, Pficiderer, Sayoe, and Hatch. The Hibbert Journal, financed by the Trust, was founded in 1902. Hibbing, th. in St. Louis co., Minnesota, U.S.A., situated 65 m. N.W. of Duluth. It is in the centre of the great Mesabi iron oro deposits. One of the mines is said to be the largest in the U.S.A., and has produced as much as 4,700,000 tons in one year. The chief industries are iron mining and lumbering. Pop. 16,300.

16,300. Hibernation (Lat. hibernum, winter), term applied to the dormant condition of certain animals during the cold weather. The same process is to be seen in warm lats in the summer, and is then called astivation (q v.), from the Lat. estvum, summer. The cause of the practice of H. is probably the failure of the food supply. Among the hibernating animals are the bat, the bear, the badger the dormouse, the marmot, the hedgehog, many reptiles, and terrestrial molluses. The animals and terrestrial molluses lesiah, and it may well have been to his influence that Hezekiah's reforming zeal was due. But the reign is memorable for great deeds without, as well as for reform within. The Assyrian overlordship was rejected, and in the second of the two expeditions sent to reinstate it, Israel won a conspicuous success.

Hiawatha, legendary chief who ft. about 1450, belonging to a tribe of the N. Amer. Indians. He is said to have formed the League of Six Nations, known as Iroquois, and to have been sent on earth to teach men the arts, argiculture, medicine, and mavigation. He departed to the land of Ponemah (Hereafter) on the appearance of the white man. Longfellow's famous poem The Song of Hiawatha (begun June) take precautions against being exposed to

that hibernating animals can be in a poisonous atmosphere for a long time with no ill effects; (3) the cessation of all activities connected with alimentation and excretion.

Hibernia, also Ierne, Iverna, or Juverna, old classical name for Ircland used by the

Roms.

Hibiscus, genus of malvaceous plants, consisting of 150 tropical and sub-tropical species, most of which are herbaceous in habit. They abound in the hot parts of Asia, America, and Africa, while a few are to be found in Europe, and many are valued for their mucilage and the tenacity of the fibre of their bark. II. esculentus is a species which is cultivated on account of its unripe fruit, the abundance of nucleage which it contains rendering it a useful article of diet. H. Rosa-snensis is well known as an ornamental plant.

Hiscough, or Hiscoup, abnormal form of respiration in which an inspiration is checked by the sudden closure of the glotds. The inspiration is due to a spasmodic contraction of the diaphragm, and this may be caused by an abnormal stimulus of any part of the phrenic norve; it is, therefore, usually an involuntary roflex following irritation of the mucous membrane of the stomach. The characteristic sound is caused by the passage of the inward current of air through the on the closure of the glottis, Temporary attacks may usually be cured by a fraight of cold water, but in certain complaints the accompanying H. may last for days. Bismuth or potassium bromide is generally administered in such cases.

Hichens, Robert Smythe, Eng. novelist and journalist, b. 1864, at Speldhurst, Kent; eldest son of Canon F. H. Hichens. Educated at Clifton College and at the London School of Journalism. Very popular novelist and successful playwright. His first novel, The Green Carnation (1891), His first novol, The Green Carnation (1891), was a satire on the mannersms of Oscar Wildo, then at the height of his fame. He subsequently pub. The Call of the Blood (1906), Bella Donna (1909), The Dweller on the Threshold (1911), The Way of Ambotion (1913), In the Wilderness (1917), Mrs. Marden (1919), Decembe Love (1923), Doctor Artz (1920), The Bracelet (1930), My Desert Friend (1931), The Friest Ludy Brendom (1931), The Paradine Case (1933), The Afterglow (1935), Secret Information (1938), The Million (1910), Incognito (1947), Too Much Love of Living (1948), and an autobiography, Yesterday (1903), and The Garden of Allah (1905). Hickes, George (1642–1715), Eng. divine and philologist, b. at Newsham, near Thirsk, Yorkshiro. He received many preforments et the Deginning of his career.

Thirsk, Yorkshire. He received many preferments at the beginning of his career, but at the Revolution, on refusing to take an oath of allegiance to William of Orange, was deprived of all his benefices. In 1691 he was consecrated suffragan bishop of Thetford by a nonjuring prelate. His fame rests on Thesaurus Grammatico-Oriticus et Archælogicus Linguarum Veterum Septentrionalium

biographical notice in J. Nichols, Literary Anecdotes, 1812.

Hickory, native tree of N. America, belonging to the genus Carya. The word is contracted from the native Virginian pohickery. The husk which covers the shell of the H. nut separates with four valves, while the nut itself has four, or even more, blunt angles. The male flowers are borne in catkins and the leaves flowers are borne in catkins, and the leaves flowers are borne in catkins, and the leaves are pinnate with serrate margins. The tree is fine and graceful with beautiful leaves. The wood is very valuable for fuel purposes. The best known species are: C. alba or shell-bark II., which produces very fine nuts; C. olivæjormis, which produces the popular pecan nuts; C. porcina, which has pig-nuts; and C. amara, with very bitter nuts which are units nutsetable. quite uncatable.

Hickory, th. of Catawba co., N. Carolina, U.S.A., on the S. and the Carolina and N.W. railroads. It manufe, flour, lumber, carriages, and foundry products.

Pop. 13,100.

Hicks, Sir (Edward) Seymour (1871-1919), Eng. actor-manager, b. at St. Heller, persey, son of an army officer. First appearance at Grand Theatre, Islington, 187; in In the Ranks. Chief light comedian at the Galety Theatre from 1894. He married the actress Ellaline Terries (b. 1872) in 1992. H. was author Terriss b. 1872) in 1902. H. was author of numerous plays, including Bluebell in Fairpland (1901), The Catch of the Senson (1901), and The Man in Dress Clothes (1922). He was Knighted in 1935. Pub. Turniy-four Years of an Actor's Life (1910), Between Ourselres (1930), Acting: 1 Book for Amateurs (1931), and The Vintage Years (1943).

Hicks, William (1830-83), Brit. soldier. He entered the army in 1849, and served with distinction through the Indian mutiny. He took part in the Abyssinian

mutiny. He took part in the Abyssinian war (1867-88), and retired with the rank of colonel in 1880. In 1882 he entered the Khedive's army, in which he was known as Hicks Pasha. As chief of the staff he drilled the army into good order, and drove the dervishes out of the country between Sonnea will Ventrue. between Sennar and Khartoum. Although he objected that his troops were unfit to accomplish the task, he was despatched to recapture El Obeid, which had been taken by the Mahdi. At the Battle of Kashgil hy the Mahdi. At the Battle of Kashgil on Nov. 1, between H. and the personally led forces of the Mahd', the majority of his men were slaughtered, and H.'s head was cut off. See J. Colborne, With Hicks Pasha in the Soudan, 1884.
Hicks-Beach, Sir Michael Edward, see ST. ALDWYN, EARL.
Hidago, state of Mexico, bounded on the S. by Flaxcula and Mexico, Querétare on the W., San Luls Potosi on the N., and Vera Cruz and Pueblo, on the E.

on the W., San Luis Potosi on the N., and Vora Cruz and Pueblo, on the E. The N. and N.E. part is mountainous and rugged, being travorsed by spurs of the Sierra Madre range, while in the S. and W. the country is fertile. Mining is carried on to a large extent, the silver and gold mines especially being world famous. Iron is worked at Encarnación and Apulco; other minerais mined are quicksilver. conver. Linguarum minerals mined are quicksilver, copper, (1705). See lead, and zinc. The orange and sugar

cane are cultivated, also the staple cereals. The cap, is Pachuca. Area 8057 sq. m. Pop. 771,800.

Hidalgo (from Mjo de algo, son of somebody, or possibly *Halicus*), title of the lower nobility. They had the right to use the title don, but when constitutional gov. was instituted their privileges were taken

Hidago del Parral, city of Chihuahua, Mexico, situated about 120 m. S.E. of the tn. of Chihuahua. In the vicinty are gold and silver mines. Pop. 16,000.

Hides, see LEATHER.

Hiempsal, name of two princes of Numidia: (1) Son of Micipsa, was nur-dered by Jugurtha, who had been given by Micipsa a share in the rule of the kingdom. (2) Probably grandson of Masmissa, and ruler of Numidia after the Jugurthine He was afterwards driven from his kingdom by the followers of Manus, but in 81 B.c. the kingdom was restored to him by Pompey.

Hierapolis: (1) 'The Holy City,' so called by reason of its hot springs and cave, Plutonium, mentioned by Strabo, on account of which it was held sacred. Paul founded a Christian church here and it was the bp. of the philosopher, Epictetus. It was also a seat of worship of the tetus. It was also a seat of worship of the goddess Cybele, and a centre of Phrygian nationality. See Sir W. Ramsay, Cities and Bishopries of Phrygia, 1895. (2) An anct. city of Syria (Gk. Bambye, Arabic Mumby) on the high road from Antioch to Iraq. At one time an important centre of the cotton and silk trade, its decay dates from the Mongol invasion. Romani d Diogenes captured it in 1688, and it was stormed by Saladin in 1175. It was a sent of worship of Astarte, whose temple was ravaged by Crassus in 53 B.C.

Herarchy (Lat. hierarchia, ik. icoodia from icos, sacred, and odds, leader), coverning body of the Church, consisting of the bishops and lower orders of clergy.

Hieratic, see HIEROGLYPHIC AND HIER-ATIC WRITING.

Hieres, see HYERES. Hierocles, name of sev. Gks., the chief of whom are: (1) (ft. c. A.D. 430). A Neoplatonist writer of Alexandria. He studied under the Neoplatonist Plutarch at Athers, and for sev. years taught at Alexandria. He later removed to Contantinople, where his religious views caused such offence that he was cast into prison. To him is attributed a commentary on Pythagoras's Carmina Aurea (ed. F. W. Mullach, Fragmenta philosophorum (1860), and Φιλογιλως, a collection of over 250 jests (αστια) (ed. E. Eberhard, 1869). (2) Stole, the (ed. E. Eberhard, 1869). (2) Stole, the author of Elements of Ethers ('110ury oroixeiwors), which is sometimes attributed to the above. See Prachter, Hurokles der Stocker, 1901. (3) (fl. c. A.D. 300). Proconsul of Bithynia and Alexandria, supposed to be the instigator of the per-secutions of the Christians (303), and the

author of Loya chahydic spor row xportarous.

Hieroglyphie, Hieratic, and Domotio
Writings. Hieroglyphic writing (Gk. hierogluphid grammata, from, hieros, holy,
sacred, gluphe, 'carving,' grammata,

'letters'), was the term applied by the Gks., as mentioned by ('lement of Alexandria (c. A.D. 200) in Strom. v., 4, to the pictorial symbols carved on Egyptian obelisks, sarcophagi, temples, and other obelisks, sarcopaegi, temples, and other monuments, or drawn on paintings, and which constituted one of the most important systems of writing of the anct, world. The term is also applied, although improperly, to other symbolical systems of writing, like those used on Hittie (q.v.), Mayan (q.v.) and Aztec (q.v.) monuments. The secondary meaning of the ments. The secondary meaning of the term 'hieroglyphic' for any 'unintellig-ible 'characters or, in general, as denoting something mysterious or emblematic, is easily accounted for by the fact that the Egyptian increglyphics for centuries dened all attempts on the part of antiquarians and scholars to decipher them.

The origin and the early hist, of hiero-glyphic writing are still uncertain. It is almost universally accepted that they were parallel in many respects with those of other so-celled 'ideographic' systems of other so-celled 'ideographic systems of writing (see WRITING). According to this common theory, the Egyptian hieroglyphics started with crude pictures with crude pictures objects such as 'flower's delineating objects such as 'flower,' 'sun,' 'horn,' 'eye.' Later, this method of communication becomes too slow and cumbersome, and more or less figurative objects are chosen to express compendonjects are chosen to express compendiously a whole train of ideas by their essential relation-hip with that whole of which they form a salient part. e.g. flying arrows to indicate a 'battle.' Thus, putography (q.v.) becomes ideography (q.v.); the representative signs are a more or less exact pictorial image of the object including the metaphorical or analogical expression of the idea intended, e.g. the sun is represented by a circle, the moon by the crescent. The transition from figurative imagery to symbols representing also abstract ideas, is a comparatively casson, and it becomes clear that there may be no limit to eclectic ingenuity. For example, an eye with a sceptre beneath it denotes the king or kingly power; a hawk's head surmounted by a disc, the sun. Next come combinations of figurative imagery and symbols representing abstract ideas. Characters used in this way are generally called, although not quite correctly, 'ideographs' (q.v.); quite correctly, 'ideographs' (q.v.); they are, to be more exact, word-signs. As soon, however, as the need of continuous discourse arises, it becomes evident that a number of the vital elements of speech, such as prepositions, inflexions, pronouns, or personal names, could not be represented by this means. Hence, the picture-symbols come also to be used to represent the phonetic values of words without any regard to their meaning as without any regard to their meaning as pictures, and the system becomes a kind of 'rebus-writing.' The range of expression of hieroglyphic was, therefore very wide. This was already recognised by the famous decipherer of the Egyptian hieroglyphics, Jour François Champollion (1790–1832), who concluded 'that there was no Egyptian writing altogether pic-torial or representative, that the anct. Egyptians did not employ a mode of

In order to remove ambiguities, there are introduced determinatives, that is signs, which defined the meaning of a sword by denoting the class to which it or multi consonantial phonograms, which belongs 'mountains,' 'islands, 'women,' is they combined with the determinatives

'to see,' 'gods,' 'negation,' and so forth These determinatives were ideographs or plicated script, and maintain d it for over plicated script, and maintain d it for over three and a half thousand vents, i.e. from word, but were not pronounced, because, '3000 B.c. to about the sixth century word, but we're not pronounced, because, as mentioned, they only fulfilled the function of determining the meaning of the word they followed. For instance, the symbol representing 'a man with a long beard' wis the determinative for 'gods,' august persons,'and 'kings'; 'a man with raised hands' determined 'adoration,' invocation 'and 'prayer', 'the prone figure of a man' determined the ideas of 'death,' massacie,' ememies,' and so forth. Thus, in general the employment of hicroglyphic characters was threefold, (1) word-signs, acters was threefold, (1) word-signs, however, from left to left sometimes, (2) phonograms and phonetic complements; (3) determinatives. As to the phonograms, it must be pointed out, that they usually consisted of the bare root of the words, but, as the Egyptian within the constant of the sometimes are the beginning of the lines that the words, but, as the Egyptian within the sometimes are the beginning of the lines the sometimes. the words, but, as the Egyptian writing (like the Semitic alphabets) was purely

a D, to which the latest nicroglyphic in-cuptions belong like the Mayan or Aztec cripts, but unlike the Chinese or cunciwere highly pictographic, and minitained their pictorial character right to the end of the employment of this script. Besides, while the symbols of Aztec script, for instance, were crude pictures, Egyptian bicroglyphs on the whole were artistic drawings. The direction of writing was

The signs muc the beginning of the lines. Some inscriptions are written vertically. Heratur (from Uk hierartikos, 'sacred, priestly') or 'priestly' withing, was a simple modification of the hierarglyphic priestly in the pr consonantal, and there was practically no simple modification of the hieroglyphic need for three-consonantal phonograms, system, differing from it only in the exgenerally speaking the phonograms were ternal form of the signs. At the time of

and making copies on papyrus or Egyptian religious texts and literary compositions; and the term 'hieratic' was particularly suitable as opposed to the demotic writing (see below), which then was the script of everyday life. In earlier times hieratic writing was the only Egyptian cursive script employed both for sacred and professe autoroges while the hieroslyphia and making copies on payvrus or Egyptian pictures, that has survived (although only religious texts and literary compositions; in a schematic form) in the hieratic and the term 'hieratic' was particularly suitable as opposed to the demotic writing disappeared. Besides, whole esception, which then was the script of were fused by ligatures into single demotic everyday life. In earlier times hieratic signs. On the other hand, as a system of writing was the only Egyptian cursive script employed both for sacred and profame purposes, while the hieroglyphic it was neither syllabic nor alphabetic, but

Clement of Alexandria, from whom the scribes as a cursive simplification of hierarchic is taken, this script was atic writing. Practically all the chief mainly employed by priests for writing characteristics of the hieroglyphics, or and making copies on papyrus of Egyptian pictures, that had survived (although only

EARLIEST HIEROGLYPHIC CONSONANTAL SIGNS

in one way or another from about 3000

writing was the Egyptian monumental consisted essentially of word signs, phonoscript. The hieraric script was employed grams and determinatives (see above). It in one way or another from about 3000 s.c. to the third century A.d. The direction of writing, originally vertical, later became horizontal from right to left. A fine example of hieratic writing is to be seen in the Brit. Museum in the Great Harris Papyrus A page of this papyrus is reproduced in the illustration on p 125.

Demotic writing (from Gk démotika of grammala, as mentioned in Herodotus, II, 36, or démoid, in Diodorus, from démos, 'people'), that is 'the people's' writing, or 'popular, vulgar 'characters, was also called 'enchorlal '(on the Rosetta Stone, see below), from Gk. enchôra, enchôrus, of the country,' or 'native' writing, or 'epistolary characters' (grammala epistolographika, in Clement of Alexandria, strone, v., 4). It was a conventional system of signs constructed by the was written horizontally, from right to lett Demotio writing was employed from about the seventh century B.c. to

teenth to cighteenth centuries were unsuccessful, although Warburton conjectured the existence of the 'alphabetic' characters, De Guignes conjectured that some of the signs were determinatives, and the Dan. scholar G. Zoega 'guessed' that sev. of the incroglyphics must represent sounds, and actually used the term phonetic in this context in his work on obelisks pub. at Rome in 1797; he also recognised that the oval rings, known as cartouches contained royal names. At the beginning of the nineteenth century, real progress was made by Swedish and Eng. scholars in decipherment of demotic and later of hieroglyphic writing. Dr. Thomas Young, of Eurmanuel College, Cambridge, pub. various discoveries in the Supplement to the Encyc. Brit., 1819. His was the first real attempt to determine the syllabic or appliabetic values represented by heroglyphic signs, and his work soluted by more agirs, and his was a streamely important, because it gave one of the clues to Champollion's (see below) celebrated system of phonetic values as opposed to then generally accepted theory that hieroglyphic and hieratic characters were not phonetic. He set himself the problem of determining what groups of demotic characters corresponded to certain Ck. words, and his identification in the hieroglyphic script of sev. names of gods and persons also provided a basis of Champollion's decipherment. However, the Fr. scholar Jean François Champollion may be considered as a real 'father' of modern decipherment; its key was provided by the colebrated Rosetta Stone (now in the Brit. Museum, B.M. 960, No. 24). It was discovered in 1799 by the Fr. captain M. Boussard, among the rulns of Fort St. Julien. near the Rosetta branch of the Nile, during Napoleon's attempted conquest of Egypt. It was secured for England by Lord Hutchinson under the 16th article of the capitulation of Alexandria. The discovery of this monument of black basalt excited the liveliest interest among archeologists, orientalists and especially Egyptologists. The stone contains an inscription in three scripts : hieroglyphic (upper part 14 lines), demotic hleroglyphic (upper part 14 lines), demotic (middle part, 32 lines) and Gk. (lower part, 54 lines). The Rosetta Stone is a priestly decroe drawn up in 197-196 B.c. in honour of Ptolemy V. (205-181 B.c.). The fact that a large part of the hiero-glyphic version is broken off, the beginning of the first fifteen lines of the demotic version wanting, and the end of the Gk. mutilated, rendered the key a very diffi-cult one to apply. Starting from the

three above and three below; 7 by four above and three below; 8 by four above and four below; 8 by four above and four below; 9 by three lines of three strokes each. 10 was represented by a sign having the form of a roversed U (A); 100 by a kind of spiral; 1000 by a sign representing the lotus flower; 10,000 by a kind of long, vertical, crooked stroke; 100,000 by a frog; 1,000,000 by a man with upraised arms; all the other numbers were represented by repeating the above signs.

The attempted decipherments of the Egyptian scripts by the sarants of the six teenth to eighteenth centuries were intending his views, he applied his 'al-phabet' to the reading of groups of hieroglyphics which represent common names, verbs, and other parts of speech, and to the establishing of his theory that the characters or groups of characters which

characters or groups of characters which in the bloroglyphic texts express genders, numbers, persons, tenses, etc., are only the phonetic signs of single letters.

Champollion's masterly discretation on bicroglyphic writing pub. in 1822, bis Lettre à M. Dacier concerning l'alphabet des hiéroglyphes phonétiques employés par les Fapupienss, must be considered of paramount value for the hist, of deciphermens, although for more accurate information although for more accurate information on the subject reference should be made to more elaborate modern treatises. Much to more elaborate modern treatises. Much scientific scepticism persisted until the results of Champollion's successful decipherment were confirmed by another important inscription known as the Decree of Canopus, found in 1866 by the ominent Ger. Egyptologist R. Lepsius. The subsequent work of Eng., Ger., Fr., Amer. and other scholars resulted in the fact that at the present day much that is fact that at the present day much that is tolerably certain can be postulated of the language and the scripts of anct. Egypt, and an entire civilisation extending over

three and a half millennia has been revealed.

The bibliography of the subject is en-The bibliography of the subject is encornous. Following are a few major studies, of recent date, all of them containing rich bibliographies: The Brit. Museum Guide to Egyptian Collections, London, 1909: E. Hieron, or Hiero I. (d. 466 B.c.), tyrant of Syracuse, the successor of his brother Gelon. He defeated the Etruscan fleet near Cume. On three occasions he won the crown at the Olympic games, and was a patron of Pindar, Abshylus. Simonides, and Epicharmus whom he installed at his court.

Hieron, or Hiero II. (c. 308-216 B.C.), tyrant of Syracuse, a descendant of Gelon. After his victory over the Mamertines (270 B.c.) he was unanimously elected king by all the states of Sicily. In the first Punc war he sided with the Carthaginians, but in 263 became a friend and ally of Rome, to whom he remained faithful

till his death.

Hieronymites ('Brethren of Goodwill,' Gregorians'), hermit order of Hieronymus (or St. Jeromo), an offspring of the Franciscans, founded by Thomas of Siona (fourteenth century). The community settled in Spain and later estab, branches

in Portugal, Italy, the Tyrol, and Bavaria.
Hierro, or Ferro, one of the Canary Is.,
occupying the most S.W. position of the
group. In the attempt to flud a meridian circle which should intersect only seas which divide new world from old the Meridian of Ferro was fixed upon. But the Fr. found that the is. was 20° 30′ W. the Fr. found that the 1s, was 20° 30° W. of Paris, so reckoned the geographical zero as 20° W. Hence the 'Meridian of Ferro' is really about 30° E. of the 1s. The chief th. of the 1s, is Valverde. Area about 106 sq. m. Pop. about 6000.

Higden, Ranulf (d. c. 1361), Eng. chronicler, was a monk of St. Werburgh's monustery Chester and whose creat work

monastery, Chester, and whose great work was a general hist, entitled Polychronicon. This work dealt with events down to his own time, and was printed by Caxton in 1482. It is now ed., with trans. for the Rolls Series (1865-86).

Higgins, Edward, see under SALVATION

Higginson, Thomas Wentworth (1823-1911), Amer. man of letter, b. at Cambridge, Massechusetts. Graduating from Harvard (1841), he subsequently studied theology, and became paster of a Unitarian church. He was an enthusiastic tarian church. He was an enthusiastic supporter of the anti-lavery agriation. During the Civil war he was captain of the 1st S. Carolina Volunteers, a fixed negro regiment. He wrote Army Lafe in a Black Regiment (1870), lives of Margaret Fuller Ossoli (1884), Longiclow (1902), and Whitter (1902), and Part of a Man's Life (1905). See his Collected Works (1905), 1900 (7 vols.), 1900.

Higheste, suburb of N. London, in the co. of Middlesex, about 11 m. N.W. of St. Paul's. It is noteworthy as having been rains. It is notiverthy as naving been the place where Bacon and Coleridge d., and also for its cemetery containing the remains of Lyndhurst, Faraday, and George Eliot, among other celebrities. Whitington's stone is at the foot of H. Hill, and is said to indicate the place at

Hill, and is said to indicate the place at which he turned again after hearing Bow Bells. Pop. 22,000.

Highland Cattle, see under Cattle.

Highland Dress, bost illustration which the Brit. Isles offer of a costume truly national. The 'garb of old Gaul' consisted of the 'Feilebreacan' or 'belted plaul.' A piece of tartan cloth, 4 yds. long and 2 yds. broad, was drawn in at the waist by a belt, which secured the careful folds of the lower part or skirt. The plaid, that is the unper portion, was The plaid, that is the upper portion, was usually fastened with a handsome brooch or buckle over the left shoulder, so that the right arm was quite free for use. This simple at thre was admirably adapted to the wild, free life of a Highlander. For, if he were overtaken by night or storm he might wrap his warm plaid round both his shoulders, whilst his loose nether garment was no hindrance, whether ho wished to sente heights or wade across streams. The turtas (from Fr. tiretaine, a linsey-woolsey cloth) was a device with High Church, that section of the Anglican Church which attaches supreme instruction of the administration of word coloured background for signifying the and sacrament by clerky duly ordained, wearer's clau or dist. Members of the

same sept or clan wore tartans whose main characteristics were the same, and whose variations had a local meaning. whose variations had a local meaning. Broadly-speaking, tartans are red and green: the tartan of the Macleods, Graomes, and Forbes was green, whilst the Camerons, Stewarts, and Macgregors all wore red. In time the 'Felicbeog' or 'filibeg' superseded the 'Felicbreacan.' The lower part of the latter became the 'kilt,' which was carofully sewn and tucked, whilst the body part was separate and the shoulder-plaid became merely an ornament. The kilt came merely an ornament. The kilt stopped short of the knees, and over it in front was hung the 'sporran' or 'spleuchan,' that is a goat's skin purse. The Highland 'bonnet' was a cloth cap adorned with heather, or in the case of a chief with eagle's plumes. Through his belt a Highlander would thrust his dirk, knife, pistols, and fork, whilst on horseback he were his 'truis,' or 'trews,' that is close-fitting tartan breeches and stockings made in one piece. The gentry were distinguished by silver ornaments and lace embroideries, but these are seen now only embroideries, but these are seen now only in ceremonial dress at balls, gatherings of the clan associations, and the like. The kilt is worn little for everyday dress now, but has a certain popularity for walking and climbing. It is worn by the bandsmen of Highland regiments and the Scots Guards, but is optional wear (with trews

Guards, but is optional wear (with trews or trousers) or on er and men.

Highland Light Infantry (City of Glasgow Regiment). Formerly the 71st and 71th regiments, which were linked in 1881. The 71st was raised in 1777 as the 73rd, but was renumbered 71st in 1786. Lord MacLeod's Highlanders, originally the 73rd regiment of foot but later the 71st, who ultimately became the first battalion of the Glasgow Light Infantry, had, despite their early influe of Glasgow recruits, no nominal connection with Glasgow. That began after the embodiment of a second battalien raised at Dumbarton in 1804, who were disbanded in 1815, six months after Waterloo. For a few months after 1808, at the instance of Lt. Gen. Sir John Craddock, the 71st were Gen. Sir John Craddock, the 71st were granted the title of the Royal Glasgow 71st Regiment; but in the Peninsula was they became the Highland Light Intantry, though the bonds with Glasgow were not ranted the title of the Royal Glasgow 71st Regiment; but in the Peninsula war they became the Highland Light Infantry, though the bonds with Glasgow were not weakened, the regimental records showing that of the 1671 Scottish recruits be tween 1806–1818 the greater number were listed as belonging to Lamarkshire and Ren-rewshire. Later, in 1923, royal approval was given for the adoption of the title City of Glasgow Regiment. This regiment served with distinction in India in the Carnatic and Mysore. It then saw service at the cape of Good Hope and in the Peninsular war, especially in the Tath was raised in 1787 for service in India. Like the 71st, itserved with much distinction in that country, particularly at Assaye under Str Arthur Wellesley. It served again under him through the Peninsular were the E.E. 7

Peninsular war. From 1818 to 1845 it was in Cauada and the W. Indies, then went to the Cape, and lost many men in the wreck of the Birkenhead. After the Kaffir war it went again to India. The H.L.I. saw service in the 1882 Egyptian Expedition, and fought at Tel-el-Kebir. Back to India in 1881, it served later on the N.W. Frontier during the 187-98 campaign. It fought at the Modder R. during the S. African war (1899-1902). During the First World War it raised twenty-six battalions, which served in France, Flanders, Gallipoli, Egypt, Falestine, Mesopotamia, and Archangel. In the Second World War the H.L.I. took part in the battles on the Western Front both in 1940 and 1944-45. both in 1940 and 1944–45.

Highland Park, industrial suburb of Highland Fark, Industrial suburt of Detroit, Michigan, U.S.A. with automobile manufs. Its pop. increased from 100 in 1940.
Highland Pony, see under Horse.

riigniand Terrier, see SCOTTISH TERRIER.
Highlands are to be distinguished in
formation alike from tablelands and ints.
Cenerally speaking, H. may be said to
exist in the E. of the Old World, in the E.
of Australia, and in the E. of N. America.
They occur in broad expension measure of Australia, and in the E. of N. America. They occur in broad, expansive masses, unlike high ints. which are much more localised. Their structure, moreover, is peculiar. Both valleys and watersheds or divides radiate, and the riv. systems are like great branching trees; the distribution, as in mountainous countries, of parallel ranges separating valleys is enly rarely visible—the Appalachians are an exception; as a rule the valleys branch like fingers in the inner H., thus collecting true, streams, whilst they broaden and trib. streams, whilst they breaden and deepen as they pass outward. H. are formed by the denudation or washing out valleys, as, for example, the H. of Scotland, and by slow crustal movements,

Scotland, and by slow crustal movements, and sometimes by volcanic activities.

'The H.' means specifically that part of Scotland which stretches N.W. of a line drawn between Helensburgh and Stonehaven and the term is used in contradistinction to the Lowlands, of Scotland.

plains and valleys, they were more favourable places for prayer. The prac-tice of worship on these spots became frequent among the Jews, and was with difficulty abolished in spite of the warnings

of the Biblical prophets.

High Point, tn. in Guilford co., N. Carolina, U.S.A., is 34 m. N.E. of Salisbury. It has a thriving trade, and manufs. bricks, cotton, machinery, and tobacco. It has also furniture factories, silk and cotton mills, carries on a large agric. trade and is a wholesale centre. It

agric. trade and is a wholesale centre. Its served by three railways. Pop. 39,400.

High Priest, head of the Jewish priesthood. In the early days of the Jewish roligion there is no trace of this office, which does not appear until the campaign against the local sanctuaries had concentrated worship at Jerusalem. The true promin nee of the H. P. dates from the Exile, after the return from which he becomes the head of a theorratic state. The
regulations for the H. P. are given (see
HEXATEUGH) in Leviticus with great
detail, where his ancestry is traced from
Aaron and his son Eleazar. The vestments of the H. P. were extremely magnificent, and were worn in the exercise of his duties except on the Day of Atonement, when he alone, clad in white linen, entered the Holy of Holies to sprinkle the blood of sacrifice.

High River, tn. of Alberta, Canada, on the Highwood R., 40 m. S. of Calgary, on a branch of the C.P.R. Dairy farming

a branch of the C.P.R. Dairy farming and ranching are the chief occupations. About 20 m. distant are the Turner Valley cliffelds. Pop. 1800.
High School, term used in the U.S.A. for those schools which superseded about for toose schools which superseded about 1850 what were called academies, the difference being that high schools were maintained (as a general rule) at public, not private, expense. In some states their maintenance is part of the state constitution. A H. S. may be regarded as one supported by public funds, usually free, open to both sexes, and where pupils are prepared for technical schools and univs. There are, however, public and private H. Ss.; the term has much the same meaning in Canada, but in England has no definite significance. The Canadian public H. S. is that type of secondary school which in most of the prov. has since 1870 (the period of the origin of the free schools), come to be looked upon as the orthodox institution. Though a separate institution, it is an integral part of the educational chain from the kindergarten to the univ. It made its appear free, open to both sexes, and where pupils garten to the univ. It made its appearance in Ontario in 1871 as a democratic publicly-controlled, co-educational estab., offering a classical curriculum in preparation for a univ. or, alternatively, an Eng. curriculum for pupils intended for some immediate vocation. The Prince of Prince of immediate vocation. The Prince of Wales College, founded in Prince Edward Is. in 1860, the only secondary estab. in that Prov., has some of the features of the public H. S. County academies, the precursors of the H. S. in Nova Scotia were made free in 1864. The grammar schools, the H. Ss. of New Brunswick, were prought, under the control of the were brought under the control of the pard (1702-24).

local authority in 1884; in 1870, in Quebeo, the Protestant Board of Montreal assumed control of the existing H. S. for boys and estab. one for girls in 1875; in the eightles collegiate depts., which later became separate institutions, began to be estab. in Manitoba; in Saskatchewan H. Ss. replaced union schools (i.e. schools H. Ss. replaced estab. In manicona; in suspending wan H. St. replaced union schools (i.e. schools arising out of the movement in 1850 in Ontario, where grammar school boards and common school boards were permitted to unite and form schools for giving demonstration and demonstration to addition to cratic secondary education in addition to elementary education) in 1907; and in Brit. Columbia a free H. S. was estab. in Victoria in 1876.

High Seas, term of international law, denoting the whole extent of sea which is not under the sovereignty of any state. Every country adjacent to the sea owns 'territorial waters' restricted to the area within three m. of its shores. The H. S. are free to all nations, subject to certain laws made for the common welfare.

High Sheriff, co. or city officer vested with wide judicial and executive authority Their duties are defined by the Sheriffs Act, 1887, and include attendance on judges during Assizes, the functions of returning officers during parl. elections, and the preparation of lists of jurors. City sheriffs are appointed annually on Nov 9.

High Steward of England, one of the Great Olivers of State under the Eng. crown. The original duty of the H.S. seems to have been to place the dishes on the lord's table at solomn feasts. would appear that under the Norman would appear that under the Norman kings the office was vested in the Beaumont earls of Leacester, and passed by marriage from them to Simon de Montfort. After the latter's death in 1265 it was granted by Henry III. to his younger son Edmund, earl of Lancaster, for tyle. Edward II. configmed it to him in fee, and thereafter it descended with the earlicin and durdon of Lancaster. Un the and dukedom of Lancaster. accession of Henry IV. the office was merged in the Crown, and has since been created pro hac vice. The court of the created pro hac vice. The court of the H.S. formerly decided upon claims to do services at the coronations of the sovereign; but this duty is now performed by the Court of Claims newly appointed on each accession. A H.S. was also created to preside over the House of Lords on the trial of a peer. But after the trial and acquittal of Lord de Clifford in 1935 on a charge arising out of a motor couldn't a charge arising out of a motor accident it was suggested that this archaic mode of trial be abolished. Privilege of peerage in relation to criminal proceedings was abolished by the Criminal Justice Act, 1948. There is a H.S. attached to both univs. of Oxford and Cambridge, whose duty it is to protect the rights of the univ. courts

High Treason, see TREASON.

Highwaymen, mounted robbers who infested the high-roads of England during the seventeenth and eighteenth centuries. The most celebrated H, in hist. are: Dick Turpin (1705-39), Swift Nick Levison (hanged at York, 1684), and Jack ShepHighway. Common Law as to Highways.—A highway, which in common law (q.v.) is a term embracing carriage roads, horse or bridle roads, mere footroads, horse or bridle roads, mere looppaths, or any other public way, may be comprohensively defined as a way through or over lands of any ownership which is open to the public generally by virtue of an Act of Parliament, a proscriptive right, or by express or implied dedication. The commonest mode by which a public right of way is created is by dedication, which may take the shape of a formal invitation may take the shape of a formal invitation by the owner in fee simple (see ESTATE) of the land in question to the public to use a new or existing road, but which more often than not is merely implied from the owner's conduct. Generally speaking, uninterrupted, user for a substantial period of time acquiesced in by the owner creates a presumption of dedication which can only be rebutted by special directions. creates a presumption of dedication when can only be rebutted by special circum-stances. Uninterrupted user for twenty-one years gives the public an absolute right of way by prescription. Dedication may confer only a limited right, whether in respect of seasons, manner, or extent. A limitation in point of duration is void, for a dedication is either in perpetuity or for a dedication is either in perpetuity or not a dedication at all. It is to be noted that the H. Acts include in the statutory definition of H. heridges (not being co. bridges, or bridges repairable by the inhabs, at k wo of a hundred), towing paths, and navigable rivs., but not railways. Indeed every way which is open to the public is a H., and in this connection it is immaterial on whom is cast the burden of repair and maintenance. A street as defined by the Public Health Act, 1875, is usually, but not necessarily, a H.; a street under the Act being defined as 'any highway and any public bridge (not being a co. bridge), and any road, (not being a co. bridge), and any road, lane, footway, square, court, alley, or passage, whether a thoroughfare or not.' A H. is also usually a thoroughfare, but may, of course, be a cut-de-sac. The public right over a H. is merely that of passing along it. There is no right to use it as a place for public meetings or assemblaces, and there are say, recorded cases. blages, and there are sev. recorded cases showing that one's mere presence on a H. for ulterior purposes may well be illegal and actionable. For example, in the case of a man who repeatedly, and for the purpose of annoying, passed and repassed the plaintiff's window while the latter and his family were duning; and again in the classic case of Harrison v. Duke of Rutland, where it was held that a man had no right to go on to a H. merely for the purpose of using it to interfere with another man's right of shooting by preventing the grouse from flying towards the butts occupied by the shooters. A public right of way is, as the very term implies, restricted to the surface of the land over which it goes, and the mibsoil for ulterior purposes may well be illegal

to the owner of the soil; but in the case of most Hs. such rights are not of any practical value. A mere occupation road laid out through an estate purely for the use and convenience of the inhabs. is not thereby dedicated to the public; such private right may, however, co-exist with a public right of way, and though in general the former would be merged in the latter right, it may well be inherently a larger, and therefore independently subsisting right. A H. cannot at common law cease to be such by abandonment or non-user, for 'once a highway always a highway.' But by Act of Parliament, a H. may be destroyed, and such a course, e.g. in the case of Hs. running along dangerous cliffs, might well be advisable. Statute Law as to Highways.—Under the H. Act, 1835, as amended by the Local to the owner of the soil; but in the case Gov. Acts, 1888 and 1894, two justices have power to grant a certificate to 'stop' or 'divert' a H. if both the dist. and parcouncils (if any) concur in the proposal to stop or divert. The usual reason for stop or divert. The usual reason for diversion is that some proposed new way is more advantageous, and the only reason for stopping up a H. altogether is that the H. is no longer required. An appeal against the certificate of the justices lies to quarter sessions at the instance of any person aggrieved, who must give the dist, council fourteen days notice of appeal, and state the grounds of nust give the dist, council fourteen days; notice of appeal, and state the grounds of bis appeal. The matter will then in due course be tried before a jury. The duty of repairing and maintaining a H. is theoretically still upon the inhabs, of the per. in which it is situated, and an indictment for nuisance lies against such inhabs, at the instance of any one aggrieved if a at the instance of any one aggrieved if a H. is allowed to fall into disrepair. Nothing in the Local Gov. Act, 1929, with respect to main roads or co. roads affects the liability of any person or body of persons to maintain or repair a H. The Local Gov. Act, 1888, however, prac-tically absolved inhabs. from all liability, so far as main roads were concerned, by instituting the co. council the H. authority for such roads. The allocation of responability for maintenance of Ha. has been considerably modified by the Local Gov. Act, 1929 (see 'm/ra'). By a curious rule of law a H. authority is not liable to be proceeded against on indictment for a for misfeasance. The distinction is mainly academic, for a complaint of non-repair to the co. council is equally effective if the cost of repair of a H. is increased by extraordinary weight or traffic, the road authority may, under section 23 of the H. and Locomotives (Amendment) Act, 1878, as amended by the Locomotives Act, 1898, recover the expenses certified by their surveyor to have been incurred by reason surveyor to nave been incurred by reason of such traffic from the persons by, or in consequence of, whose order such weight or traffic has been conducted. It is entirely a question of fact in each case what constitutes extraordinary traffic, e.g. military manacuves, the erection of a mansion of factory in a remote rural dist. excessive weight of a single waron drawn implies, restricted to the surface of the land over which it goes, and the subsoil remains in the freeholder, or, if different freeholders' lands lie on either side of the th., then, generally speaking, the subsoil up to an imaginary line running down the middle of the road belongs to each adjoin ing landowner. Strictly speaking, the excessive weight of a single wagon drawn residuary rights in the surface also belong by a locomotive, may each constitute or

but apparently the true test for deter-mining whether traffic is extraordinary depends on what is ordinary traffic on the particular road, not on what other and even similar roads in the neighbourhood have borne without injury. To obstruct have borne without injury. To obstruct a H. is a criminal offence, and any member of the public may remove the obstruction. The owner of any animals which stray upon a H. (not running over common or waste land) is liable for damage occasioned thereby to adjoining property. By the Road Transport Lighting Act, 1927, Road Transport Lighting Act, 1927, every vehicle on any road was required, during the hours of darkness, to carry two lamps, each showing to the front a white light and one lamp showing to the rear a red light, and all the lights must be visible from a reasonable distance. There were special provisions as to bucycles, tricycles, and invalid carriages; bicycles not propelled by mechanical power were not required to carry a lamp showing a red light to the rear if an efficient red reflector is shown instead; and consults in the ight to the rear if an encient red renector is shown instead; and, generally, in these special cases, a single front white light was sufficient. But on the introduction of the black out, in Great Britain at the beginning of the Second World War a beginning of the second world war will we rear light was made obligatory for bicycles, etc. and the regulation has not been withdrawn. As regards horse drawn vehicles, the separate red light is not necessary if the front lamps serve the same purpose and provided no part of the vehicle or its load extends more than six feet behind such lamps. 'Darkness' in this context, means, as respects summer time, the time between one hour after sunset and one hour before sunrise, and, as respects the remainder of the year, the time between half-an-hour after sunset and half-an-hour before sunrise.

and haif-an-hour before surrise.

Maintenance of highways.—Important changes in the law of Hs., particularly in relation to the responsibility for maintenance and improvement, were made by the Local Gov. Act. 1929; but these changes do not extend to the administrative co. of London. Under this Act roads are divided into 'county roads' and 'ordinary bighways,' and into 'classified' and 'unclassified' roads, and these distinctions are made for the purpose of fixing the responsibility for maintenance. An the responsibility for maintenance. ordinary H. may become a co road by an order of the co. council, or by an order an order of the co. council, or by an order of the minister of transport made on appeal by a dist. council from the co. council's refusal or failure to make an order. Briefly, all Hs. in rural dists. and main or classified roads in urb. dists. are co. roads; and neither the maintenance and repair of a co. road by an urb. dist. council nor the delegation of functions in respect of a co. road to a dist. council will result in the road ceasing to be a co. road. A road in the Act of 1929 means a road classified by the minister of transport for the purpose of the Act. Since 1936. for the purpose of the Act. Since 1936, council may act as agents of the co. however, there has been introduced a third category of H.—the 'trunk roads.' By place a road in repair or notify the dist. the Trunk Roads Act, 1936, the minister of transport became the authority for 'the land such notice may be given whenever

result in extraordinary traffic. It is not print roads in Great Britain which con-easy to reconcile the cases on the subject, stitute the national system of routes for through traffic. But no road within the co. of London or within any co bor. is included in the category of trunk roads. The roads which became trunk roads are The roads which became trunk roads are listed in the first schedule to the Act; the total mileage of trunk roads in Great Britan is now 4500, and the minister of transport is responsible for their maintenance and improvement. The minister may, however, by agreement with any co. council or co. bor. council or urb. dist. council delegate to these councils all or any of his functions with respect to the metro. of his functions with respect to the maintenance and repair and improvement of any trunk road; but such functions may not be delegated to a bor. or urb. dist council with respect to any road outside the bor. or dist.; nor, except with the con-scut of the co. council in which the road is sett of the co. council in which the road is situated, may the minister's functions be delegated to the co. council with respect to only road outside the co. Even where there is delegation, the council merely acts as agent for the minister and in accordance with prescribed conditions, particularly in relation to securing ministerial approval for works expenditure. It is for the co. for works expenditure. It is for the co. council or other appropriate local authority to exercise the statutory functions, in relation to trunk roads, prescribed by the Restriction of Ribbon Development Act, 1935, unless they have relinquished those functions in the manner provided by the Local Gov. Act, 1929 (section 32).

To the minister of transport the Act of 1929 transferred all powers and dribes of

1929 transferred all powers and duties of any gov. dept. in relation to (inter alia) roads, bridges, ferries, vehicles and traffic thereon, with certain exceptions; but the Board of Trado retains all its powers the Board of Trado retains all its powers and duties under any local, special, or private Act, and the minister of health retains all his powers and duties in regard to sanctioning Boans by local authorities, under the Housing Acts, and in respect of the confirmation of by-laws. But the minister of transport has succeeded to the powers of the Road Hoard under the lovelengent, and Road Improvement. powers of the Road Road Improvement Dovelopment and Road Improvement Funds Act, 1919. By the Local Gov. Act, 1929, the rural dist. councils have censed to be the highway authorities, and the co. councils have taken their place; but the rural dist. council retains 'functions, which include powers and duties under the Local Gov. Act, 1894, as to rights of way, and encroachments on road-side wastes. The rural dist. council may also have certain functions of the co-council delegated to them as to mainte-nance and repair. The words 'County Council' in the Act of 1929 do not include co. bor., and for ordinary Hs. within a bor the bor. council is the H. authority. Where an urb. dist. has a pop. of more than 20,000 the dist. council may claim to exer-20,000 the dist, counsil may claim to exercise the functions of maintenance and repair of any co. foad, not including bridges, within their dist. The dist. council may act as agents of the co. council. The co. council may themselves place a road in repair or notify the dist. council to do so within a reasonable time, and such notice may be given whenever. the co. council are satisfied on the report of their surveyor that repair is required.

Road Traffic Acts.—The ever-increasing use of motor vehicles on H. has led to the passing of many Acts to regulate such traffic. The Road Traffic Act, 1930, consolidated the law by repealing some thirty earlier Acts, and made numerous amendearner Acos, and made numerous annua-ments and new provisions to keep abreast of the rapid development and universal use of motor vehicles. Motor vohicles used for the carriage of goods are dealt with under the Road and Rail Traffic Act. The minister of transport has wide powers of making regulations under the Road Traffic Acts. The ministry has compiled a Highway Code as authorised by statute. It is issued with driving licences, and copies may be obtained from the Stationery Office. It is intended as a guide to persons using the road, and may be revised from time to time. Failure to observe the code layer to frame in Itself. observe the code is not an offence in itself, but it may be relied on as tending to establish or negative the liability of a party to any legal proceedings. Under the Act of 1934 the minister of transport may establish crossings for foot passengers or make regulations as to the procedence of vehicles and foot passengers and, generally, as to traffic movement at or near a crossing and erect traffic signs in connection with the crossings and may call upon local authorities to submit schemes for providing such crossings. This Act also provides a general speed limit of 30 m.p.h. in 'built-up areas.' Speed limits for classes of motor vehicles other than ordinary passenger motor cars are prescribed in the same Act. The minimum ages for drivers of motors are: for motor-cycle, 16 years; for private car, 17 years; for vehicle weighing 2½ tons unladen (or over), 21 years. No person may use, or permit to be used, a motor vehicle unless covered by a policy of insurance in respect of third-party risk. Under the Act of 1934 it is the duty of insurers to satisfy claims in respect of third-party risks notwithstanding provisions in the policy entitling them to avoid liability, unless the policy was obtained by misrepresentation. Full provision is made in the Act of 1930, for the regulation of public service vehicles. The Speed limits for classes of motor vehicles regulation of public service vehicles. The use of certain roads and bridges by goodscarrying motor vehicles is also controlled by the Road and Roil Traffic Act, 1933. Every motor vehicle, excepting motor-cycles, must be fitted with a reflecting mirror.

mirror.

the beautiful bronze doors executed by Bishop Bernward, was hadly damaged, and its cloisters partly destroyed in the Second World War. It holds the sarcophagus of St. Godehard, and the tomb of St. Epiphanius. There are also the Romanesque church of St. Godehard, built in the tweifth century, and the church of St. Michael (burnt out), founded in the eleventh century, (burnt out) Rathaus, and the Wedekindhaus (1598), and the St. Michael Monastery, now a lunatic asylum. The guild-house of the the beautiful bronze doors executed by and the St. Michael Monastery, now a lunatic asylum. The gulld-house of the butchers (1529), a fine example of a wooden building was destroyed by bombing. The chief productions are sugar, tobacco, stoves, and machinery. H. was the seat of a bishopric from 822, and was one of the original members of the Hanseatic League. A unique collection of Rom. silver plate of the time of Augustus was found on the Galgenhery. E. of the

pub. in 1753, and his Dramatic Works in 1760. See H. Ludwig, The Life and Works of Aaron Hill, 1911; and A. Dobson Rosalba's Journal and Other Papers, 1915. Hill, Ambrose Powell (1825-65), Amer. Confederate general; b. in Oulpeper oc., Va.; son of Maj. Thomas H. Graduated, U.S. Military Academy, 1847. Fought at Williamsburg, Richmond, and second battle of Bull Run. Received surrender at Harper's Ferry, Sept. 17, 1862. Commanded: Div., Fredericksburg, Dec. 13, 1862; Reserve, Chancellorsville, May 2-4, 1863 (wounded); one of three corps into which Lee's army divided May 10, 1863. Engaged at Gettysburg, Bristow Station, Weldon Rallroad. Near Petersburg April 2, 1865, shot from his horse and killed. Clement (1877-1945), Australian

Hill, Clement (1877-1945), Australian cricketer. Considered by many qualified judges of the game to have been the best left-handed batsman ever known in the hist. of cricket. On all wickets and against any bowling combination, 'Clem' Hill controlled match after match in which he took part. Showed great promise as early as 1894-95 when he scored 150 (not out) and 56 for S. Australia against A. E. Stoddart's team. Came to England with G. H. S. Trott's team in 1896, being one G. H. S. Trott's team in 1896, being one of the mainstays of a famous eleven and surpassed in scoring ability only by Sid Gregory and J. Darling. Against Stoddart's second team in Australia in 1897–98 he scored 829 runs in 12 innings, his record being better than that of either A. C. Maclaren or K. S. Itanjitsinhji. Scored 200 for S. Australia in that season, but his greatest innings was in the fourth Scored 200 for S. Australia in that season, but his greatest innings was in the fourth test match, at Melbourne, when he made 188 runs out of a total of 323, against the bowling of J. T. Hearne and J. Briggs. When the Australians visited England in 1899 he headed the batting averages, his aggregate including a score of 135 at Lords. In 1901-92 against A. C. Maclaron's team in Australia he averaged 52 in ten innings in Test matches. He was also leading scorer of J. Darling's team in England in 1902, but on return to Australia was at length outrivalled by Victor Trumper. In 1907, however, against A. O. Jones's team he played a great innings of 160 at Adelaidie. Possibly his surest quality was an ability to master his surest quality was an ability to master any ball bowled on the leg stump; he was

tobacco, stoves, and machinery. H. was the seat of a bishopric from \$22, and was one of the original members of the Hanseatic League. A unique collection of Rom. silver plate of the time of Augustus was found on the Galgenberg, E. of the tm., in 1868. Pop. 62,500.

Hill, Aaron (1685-1750), Eng. writer, b. in London. On leaving Westminster School he travelled in Turkey, on which he pub. A Full and Just Account of the Present State of the Ottoman Empire (1709). His contributions to the drama include: Elfrid or the Frit Inconstant (produced at Drury Lane in 1709), The Tragedy of Zara (1735), and Merope (1749). He was included in Pope's Duncial, and retored in The Progress of Wit, being a Caveat for the use of an Eminent Writer (1730). His Works, including poems and letter were

master of his old school, and, like him. proved averse from exercising any kind of coercion on his pupils. A contributor to the Saturday Review (1869-84), he pub. after his retirement from teaching (1877), after his retirement from teaching (1877), a series of scholarly eds. of Johnsonian literature, including Bosvell's Life of Johnson (1887), and Dr. Johnson, his Friends and Critics (1878). His ed. of Johnson's Lives of the English Poets was pub. in 1905, with a memoir by H. S. Scott, and a bibliography.

Hill, James Jerome (1838-1916), Amer. raliway president, b. near Guelph, Ontario. He graduated at Yale Univ. and then worked in raliway offices in St. Paul, Minnesota. In 1870 he formed the

Paul, Minnesota. In 1870 he formed the Red R. Transportation Co., between Saint Paul and Winnipeg, and was the founder of a syndicate which built what is now the Canadian Pacific Railroad. He president of the Great Northern Railway, president of the Great Northern Railway, which he helped to build, from 1895 to 1907, and made of it one of the greatest railway systems in the U.S.A. It ran a steamship line to China and Japan. In his later years he was recognised as one of the leading railway authorities in the U.S.A

Hill, Sir George Francis (1867-1918). Eng. numismatist, antiquary and historian b. at Berhampur, India, son of Samuel John H., a missionary. Educated at John H., a missionary. Educated at Blackheath school for sons of missionaries (later Eltham Conege), Univ. College School and Univ. College, London, thence as an exhibitioner at Merton College, Oxford, of which he became an honorary fellow in 1931. Anct. hist, was his main subject, and he became a pupil of Prot. subject, and he became a pupil of Prof. Percy Gardiner, from whom he acquired his interest in numismatics. In 1893 he was appointed to the dept. of Coins and Medals, Brit. Museum. In 1897 appeared his first vol. in the great Gk. catalogue there, five others following in the next 25 years, covering the Middle East. These catalogues set a new standard for numismatics in their marshalling of numismatics in their marshalling evidence, discussion of problems involved, and accuracy of description. Editor of the Journal of Hellenk Studies and of the Numismatic Chronicle for many years. His study of It hist, and art resulted in learned works on Pisnello and the Corpus of Italian Medals before Cellini (1930). His appointment as director and principal librarian of the Brit. Museum (1931–36) was marked by the acquisition from the Soviet Gov. of the Codex Sinaiticus (q.v.) and of the Eumorfopoulos collection of Oriental antiquities, the latter shared with the Victoria and Albert Museum. He spent his retirement in writing a hist. of evidence, discussion of problems involved, spent his retirement in writing a hist, of Cyprus (1940-48) carrying the story of the is, down to 1571 with much detail on the Lusignan dynasty. K.C.B., 1933. Vice-President of the Society of Antiquaries and a member of the Royal Com-

mission on Historical Monuments. Hill, Sir John (c. 1716–75), Eng. author,

pub. a trans. of Theophrastus's History of Stones (1746), and wrote many botanical works, including The Vegetable System (26 vols., 1759-75).

Hill, Octavia (1838-1912), Eng. social reformer, was educated at home. Encouraged by Ruskin, she bought three cottages in Marylebone (1864), and was so successful in increasing the self-respect and improving the material welfare of her tenants that the Countess Ducle gave into her charge a property in Drury Lane. her charge a property in Drury Laue. Latterly, she was at the head of a staff of assistants who, between them, collected the rents of 6000 dwellings and tenements in the metropolis. Land (1878).

Hill, Rowland (1744-1833), Eng. preacher, the sixth son of Sir Rowland H., first haronet, b. at his father's seat, Hawkstone Park, Shropshire. Educated at Shrowshury and Eton, and whilst still young received deep religious impressions from his eldest brother Richard. Entered St. John's College. Cambridge. in 1764 St. John's College, Cambridge, in 1764, and whilst there visited the sick and preached wherever he could. In 1769 he graduated P.A. with honours, and endeavoured to obtain orders. Ordained June 1773 to the curacy of Kingston. Somersetabilite, but refused priests orders on account of his unconventional style. He continued to preach to immense congregations. In 1783 Surrey Chapel was built for him, which remained the ordinary scene of his labours till the end of his life, and under its pulpit he was buried. H. was deeply interested in Sunday-schools, and there were thirteen attached to Surrey ('hapel with over 3000 scholars. He took a prominent part in all philanthropic and religious movements, and his earnest, eloquent, and eccentric preaching attracted large congregations. See life by Rev. Edwin Sidney (4th ed.), 1861

Hill, Rowland, first Viscount (1772–1842), Brit. general, nephew of the preacher Rowland Hill, was b. at Preed Hall, near Hawkstone. He commanded the 90th Regiment in Abercromby's Egyptian expedition (1801), and served throughout the Peninsular war as Sir Arthur Wellesley's ablest coadjutor. He cantured the forts of Almera, for which captured the forts of Almarez, for which he was created baron (1814). He disne was created baron (1514). He distinguished himself by his brigade charge at Waterloo, and succeeded Wellington in 128 as commander-in-chief. See life by Rev. E. Sidney (1815).

Hill, Sir Rowland (1795–1879), originated the commander that the commander that

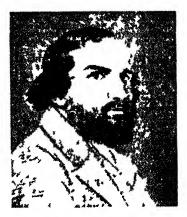

nator of the penny postal system, b. at kidderminster. As a boy he was interested in mathematics, and later in life became engaged in mechanical inventions. lis ideas on a uniform rate of postage, regardless of distance, were pub. in pamphlet form, Post Office Reform (1837). In 1839 he was attached to the Treasury, and his schemes were realised in the following year. It was dismissed from office when the Conservatives came into b. at Peterborough. He set up an apothe-cary's shop in St. Martin's Lane, London, office when the Conservatives came into became editor of the British Magazine (1746-50), and contributed to the London Whigs was appointed secretary to the Advertiser and Literary Gasette. He also Postmaster-General (1846). In the same

Near H, in 1920 some 300 men of the Manchester Regiment were massacred by Arabs in for his fine interpretation of Bach and Beethoven

Hill Figures, see WHITF HORSE

Hill Figures, see White Horse Hill-forts are, as their name implies fortifications exceted on the top of a steep chiff or mountainous crag. The summits of hills like is and fens, were positiarly adapted to serve as the last refuge of a native race in a country invided by a stronger people. So H are found of great antiquity, constructed by uncivilised peoples, as 1) Wilson says, the simple circular H, whether we have the mere people as 1 wheren we have the mere rudhentary efforts of a people in the mfancy of the arts. To this category belong the rude earthworks found on the top of many peaks in the But Isles Scotland is especially rich in H, many of which are of a somewhat more advanced type. I wo or three concentric circular ramparts defend the summit of the hill, so that as the invading party storned one line of defence the defenders might retire Liadually into their innermost stronghold The H which is at the summit of White Caterthun in Forfarshire may be described in some detail as being type at of many others. The hill in question is 976 ft high. The first resistance to an attacking force is offered by a double entrenchment 200 ft below the summit the formation of the cliff then procludes further advance save on one side. The end of this path by 200 ft the width of the walls in which are found chambers as in the light cishels (q i) is 26 ft Among other H
in the Brit Isles may be mentioned Arbory
1 rt in Lanarkshire Dun Muray in Dun Muiray in Angylishire, and Dun Arigus in the Aran ledes In many cases of course a H was the residence and head marters of a wirrior chief or a robber baron, as in the medieval ages In this class come the H of the wild tribesinen of Afghanistan and the VW frontier of India For the vitri fication of the stones of H, see under VIRUFIED IORIS See Dr. D. Christison, I arly Fortification in Scotland, 1818, F | Burrow, Ancient Larthworks and Camps 1924

Royal Academy, which to-day possesses royal Academy, which to-day possesses, his masterpiece, a representation of 'Christ crowned with Thorns' (1823). His other pictures include' Rebocea and Abraham's Servant' (1829), and 'Edith finding the Body of Harold' (1834),

Hilversum, tn. in the prov. of N. Holland, 18 m. S.E. of Amsterdam. It manufs, horse-blankets and carpets. It is a popular summer resort, and its neighbourhood is attractive. It has a large wireless station. Pop. 84,200. Himalaya Mountains, in Central Asia, most elevated highland system in the world. The word Himalaya is Sanekrit, and means, 'Abode of Snow,' the same Aryan root being preserved in the Ck. xilpa, snow, and the Lat. kirns, winter. The il. M. siretch from the seventy-second to the ninety-sixth meridian E of Greento the ninety-sixth meridian E of Greento the ninety-sixth meridian E of Green-wich, and, with a breadth varying from 180 to 220 m. form a broad, sweeping bar-rier between Tibet and the Indian penin-sula from the W. confines of Kashmir to the E. limits of Assam. Undoubtedly they belong structurally to the great plateau of Central Asia, of which they may be regarded as forming the S. scarp. On the Indian side the slopes of the main ridge are precipitous right down to the marshy 'Tarni' or 'Tariyani.' This is a bolt of grassy lands, about 12 m. wide, traversed by many sluggish streams, along whose banks are treacherous morasses covered banks are treacherous morasses covered with tall reeds: It fringes the Pakistan, Indian, and Nepal frontiers for almost 500 m. from W. to E. Towards Central Asia the fall of the H. M. is gentle. Broadly speaking, their direction W. of Mt. Everest, the highest known peak on the globe (29,141 ft.), is N.W. and S.E., but from this height to the boundaries of China the lie is almost due E. It is a Othina the lie is almost due E. It is a mistake to regard the H. M. as a single unbroken chain; they are rather a series of ridges roughly parallel, whose symmetry is confused by a multitude of substitute of subs sidiury spurs, which strike out from them in all directions.

What is sometimes called the Indian watershed separates into two classes the rivs. which pass out to the Indian Ocean : those which cut a direct way through the mts. on to the plains of India, and those which after being gathered on the top of the tableland reach the sea by two streams which set out at distant points towards opposite limits of the chain. But the great divide, sometimes referred to as the Turkish watershed, is the ridge of the N. rango, which is the natural clearage line between the rivs. which disappear somewhere in the level stretches of Mon-golia and Turkestan and those which eventually join the Ladian Ocean. The Indian watershed is remarkable for its beight, which averages about 18,000 ft. between the Brahmaputra and the Indus. The valleys traversing the highlands from the watershed to the Indian plains are gigantic gorges and offer small encouragement to human habitation. Yet some ment to human habitation. Yet some few, with an elevation of from 6600 to 7000 ft., are fast becoming favourite situations for summer retreats of Europeans eager to escape the sweltering heats of Bengal. Other valleys reach right up into the line of highest summits without rising to a higher elevation than 3000 ft., and thus harbour tropical heat and vegetation that the foot covergence heat and vegetation that the foot covergence has the first the foot of recovergence highly the second s tation at the foot of snow-capped heights. For the mest part the valleys slope gradu-

WEDGE PEAK

One of the peaks of the Kangchenjunga group which rises 8000 ft. above the Kangchenjunga gizcier.

crossed longitudinally by sev. valleys which confine the Indus and other rivs. for bundreds of miles before giving them an opening southward. The Central Himalayas contain the highest summits in the layas contain the highest summits in the world, and comprise the regions of Hundes, Garhwal, and Kumaon, which were scientifically surveyed in 1892. They are sometimes called the Nepal Highlands and extend from the source of the Indus to the Tista—an affluent of the Jumna The highest group of mts. in the world is in the Karakorum, not in the H. M. Other outstanding crests besides Everest are Kangsheniungs (Kunghaniungs (1989) 51. chenjunga (Kunchinjunga) (28,225 ft, the third highest mt. in the world), on the Sikkim frontier, N. of Darjeeling, and Dhawla-giri (26,286 ft.) in the W. Some conception may be conveyed of the stupendous scale upon which these mts. are built, if the peaks which lie between the seventy-eighth and the eighty-first meridians— a distance under 150 m. in length—or rether their main groups, are enum-

ally till within 20 m. or so of the line of greatest elevation, and afterwards often shoot upward from 5000 to 10,000 ft within a very small distance.

It is convenient to divide the H. into three sections. The W. begins from that point where the Indus turns southward between Glight and Kashmir, a point which is marked by Mt. Nanga-Parbat (26,629 ft.). This section, which also contains Nanda-Devi (25,661 ft.), is not conspicuous in well-marked ranges, but it is the fight of the plains of the plains of the plains, there rises a sandy, waterless ridge, known as the Bhabar, whose average elevation is some 4500 ft. This tract is densely forested and absorbs all the streams which flow down from the outer highlands, but as it unfrom the outer highlands, but as it undulates down to the Tarai the waters are collected together and once more reappear above the surface. The easternmost section covers a great part of Sikkim, Bhutan, tion covers a great part of Sikkim, Bhutan, and N. Assam. Its lottlest peak is Chumolhari (23.933 ft.), but 16,000 ft. probably represents the mean altitude. There is still a wide field open to ambitious surveyors in this part of the mts., for the lower reaches of the Saupo have nover been traced, and little is known of the E. uplands.

There are naturally great variations of climate at different heights and in different regions of the H. M. A comparison be-tween langes in the W. and E. shows that the latter enjoy a warmer and more equable but also a wetter climate. More-over, the forest tracts are more widely dispersed in the E., and the area of lands dispersed in the E., and the area of lands under cultivation is probably less. Both the meteorological conditions and the scenery in the W are similar to those of S. Europe, provided, that is, that the Himalayan altitude be over 5000 ft. The snow line is much higher on the Tibetan than on the Indian side, because the latter has the greater showfall. On the S. ex-posures of the Himalayas there are perposures of the himble and there are perpetual shows to within some 15,500 ft. of the scalevel, whilst at the top of the N. tableland of Thet the show line is actually as high as 20,000 ft. Precipitation is naturally greatest on the slopes of the outermost spurs, and by the time the limits of Tibet are reached, beyond the line of highest peaks. It is so small as allimits of Tibet are reached, beyond the line of highest peaks, it is so small as almost to clude measurement. Bain falls between May and Oct., and the season is known as the S.W. monsoon, which is accompanied by moisture-laden winds from the S.W. As regards tem., both the ann. and diurnal range diminish with increase in elevation, whilst the variation of temp according to altitude is greatest in summer. The rivs. hardly ever freeze, probably because they are too rapid. Glaciers descend much lower on the outer than on the Tibetan slopes. On the valleys of the latter they come down to within than on the Tibetan slopes On the val-leys of the latter they come down to within 15,000 ft of the sea-level, but on the S. faces 11,500 ft. is a normal limit. In different parts Alpine, European, and trop-ical flora abound; the Sal, Toon, Sissoo, and Deodar supply the only timber of com-mercial value; cereals, fruit, and tea are grown with success up to a height of 7000 ft.

The H. M. afford the supreme illustra-tion of the sublimity and incomparable grandeur of mt. scenery. The reader has only to remember that the mean elevation omy to reinter that the mean elevation is some 18,000 ft., and that at least forty heights exceed 24,000 ft., to grant the truth of the assertion that the great mt. solitudes of the Himalayas, . . . the apparently endless succession of range after parently endless succession of range after range, of ascent and descent, of valley and mt. top, of riv., torrent, and brook, of prediptous rock and grassy slope, of forest and cultivated land, cannot fall to produce impressions of wonder and awe of produce impressions of wonder and awe of such intensity as can be conjured up by no other range in any quarter of the globe. (F. S. Smytho, The Kangrhenjunga Adventure, 1930). Numerous expeditions have been organised for exploring the peaks of the II., apart from sev. to Mt. Everest (q.r.). As secently as 1936 a small Anglo-Amer. expedition, organised by Prof. Graham Brown reached the summit of Nanda Boyl in the Gharwal II., after incredible difficulties (Aug. 29, 1936). mit of Nanda lovi in the Gharwal II., after incredible difficulties (Aug. 29, 1936). This was the greatest feat of Himalayan mountaineering ever accomplished. The two members who reached the summit were N. E. Odell and H. W. Tilman, both Englishmen. Two disasters overtook Ger. attempts to climb Nanga Parhat in 1936 and 1937. In the first many Ger. and native lives were lost in a storm between the higher armys bud hear property. 1930 and 1937. In the first flady ocrand native lives were lost in a storm before the higher camps had been properly estab.; the second under Dr. Karl Wen was frustrated by an ice avalance (June 5, 1937), in which all but one of a party of eight and their six Nepalese porters were overwhelmed. See S. C. Burrari and H. H. Hayden, Sketch of the Geography and Geology of the Himalayan Mountains, 1907-08; W. Whistler, In the High Himalayas, 1921; A. Albers, Itmalayan Whispers, 1926; F. S. Smythe, The Kangchenjunga Adventure, 1930, Kamel Compured, 1932, and Camp Six, 1937; E. E. Shipton, Nanda Devi, 1936; H. W. Himera.

Himmel, Friedrich Heinrich (1765–1814), (ter. composer, profited much by the patronage of Frederick Wm. II., who besides giving him a three years' musical education and sending him to Italy for two years of further study, gave him, on two years of further study, gave nim, on Reichardt's dismissal, the court-capell-meistership of Berlin. II.'s Travercantale was especially written for the king-tuneral in 1797, and his opera Alessandr, was the result of a commission from the Czar. But his finest operatic work was Franchon, das Levermächen (1801), for which Rotzebue wrote the libretto. Despite their melodic charm, his songs and missioners sonates are rearly porturned. planoforte sonatas are rarely performed.

Himmler, Heinrich (1900-1945), Ger. Nazi leader, chief of the Gestapo, b. at Munich of a middle-class family and educated at the High School of Landshut, Bavaria. At seventeen he joined a Bavarian infantry regiment as a cadet. Leaving the army in 1919 he studied at the Munich Technical College and, later, was employed at a nitrate works; then in 1928 he turned to poultry farming. He was an early member of the Nazi Party of Strassor (see HITLER) and in 1929 Hitler was an early member of the Nazi Parcy of Strassor (see Hitler) and in 1929 Hitler appointed him leader of the S.S., which was then the Black Guard or Hitler's bodyguard. He began early to study systematically the records of the Party chiefs and of their subordinates, and so accumulated a great mass of information about individuals which eventually gave about individuals which eventually gave the Gestapo so much power for blackmail. Hitler gave him a free hand in the development of the Black Guard as a strong carefully selected semi-military corps. When litter decided on the purge of 1934 (see HITLER), H. and his force were the instruments of assassination. It was, perhaps, H.'s greatest political feat that he succeeded until the Second World War was well advanced in disquising the real was well advanced in disguising the real purpose of his organisation. The S.S. had already assumed the functions of the police and was controlling the home front as a whole when he acknowledged the fact in 1935. But he remained silent in the face of demands from the Army Command that the S.S. should not interfere in Army affairs, built up a completely inde-pendent force—the Waffen S.S. equipped with the most modern weapon—and insinuated his agents into the Wehrmacht with the most modern weapont—and maintated his agents into the Wehrmacht it-elf, spreading his tentacles throughout all branches of (ier. life, liesides organising the Gestapo in Germany and beyond the frontiers he estab. a Fifth ('olumn (a.v.) wherever the opportunity offered. After the attempt on Hitler's life in 1944 (see Hitler) he was the open mester of Germany. He took command of the home army, suppressed the elements of revolt and organised the lovies of the Volkssturm. When the final Russian offensive approached Berlin in 1945 he headed a section of the defences, and it was he who in the last days of the Reich cap. made overtures for capitulation. The fearful chapter of Germany's reign of terror was primarly his work though it must not be supposed that he did not find numerous and fanatic coadjutors; but his was the baneful master mind behind the horrors that took place in Germany the horrors that took place in Germany and in the conquered ters. He was the cold and ruthless instigator of reprisals against civilians and of similar crimes. He typified the most extreme element in the forces of Nazi revolution, and caused it to become the predominating force in Ger. politics. Yet in appearance he betrayed nothing of his true character, being small in stature, insignificant looking and shy in manner. It cannot be assumed that his actions were governed solely by blood lust. His motives were deeper. He organised a vast machine of political oppression, and instigated the mass murders in the terrible concentration

camps (q.v. and see also BUCHENWALD, BELSEN) of men and women—Gers., Russians, Poles, Czechs—for the ake of what he would have called 'posterity' what he would have camen posterny—
not for a Germany victorious in the war
but for a Germany 'reborn' through the
extermination of all who might stand in
the way. This rebirth of the nation was
to be achieved through his instrument—
a body of Gers, selected for their supposed a body of Gers, succeed for their supported racial characteristics (See Aryan Para-Graph) and educated by him in the belief that the 'regeneration' of the individual according to National Socialist principles was an essential factor in the enduring dominion of the world; and military condominion of the world; and military conquest by Germany was, in his view, no nore than a condition precedent to the foundation of a new ruling class exclusively Ger. and privileged to be the embodiment of the 'Herrenvolk.' His part in the end of Narism is obscure. With Hitler dead he made his clumsy move for contribution. With Hitler dead he made his clumsy move for espitulation, trying vanly to play off the W. Allies against Hussla. He did not ask that his own life should be spared; that he knew was forfeit. He was captured, after the Ger. surrender, at Bremeryorde near Bremen trying to get away with some other Gers with the aid of false identity papers and more or less disguised. His captors, Bit security police, took him and his companious to an internment camp for interlogation, and internment camp for interrogation, and one of the latter disclosed his identity. He was then removed to Brit. Second Army headquarters, but in Luneburg while being medically examined before being handed over to the appropriate authorities as a war criminal he succeeded in taking cyanide of potassium from a phial concealed in his mouth, dying almost at once.

Hinckley, mrkt. tn., 13 m. S.W. of Lelcester, England. It is an anct. tn. on Watling Street, and has mineral springs. The chief trade is in boots, shoes, hoslery, and coarse pottery. Pop.

shoes, hostery, and coasts of the stateman and Brit. Colonial governor; b. in Cork, Ireland; youngest son of Thomas Dix H., LL.D., Presbyterian minister. Received classical education at Fermoy and Belfast. Clerk to a Belfast, firm of slipowners, emigrated in 1831, opened warehouse in Torouto. A Liberal, he estab. the Leanuner, 1833. Liberal, he estab. the Lxanuner, 1833. Elected to first parliament of 1 pper and Lower Canada 1841, inspector of public accounts, (or receiver general) 1812-43 in account. Or receiver general) 1812-43 in the Baldwin-Lafontaine Gov. Defeated in election of 1844, estab. the Filot, Montreal. Again inspector-general, 1818-1851. Joint Premier with A. N. Morin, 1851-54. Governor of: Barbados, 1853-1862; Brit Gulana, 1862-69. C. B., 1862; K. C. M.G., 1869. Itelurned to Canada; minister of finance, 1869-73. Suffered through failure of a bank of which he was president. Ed. Journal of Commerce, Montreal. Made sev. official visits to Washington and London. His gov. rendered important services in the matter of railway building and in negotiating the of railway building and in negotiating the lieutenant in the 18th Infantry Regiment. reciprocity agreement with the United His mother was the daughter of Surgeon-

States in 1854. In the struggling colony, as was Canada a century or more ago, money for the promotion of railways was not easily obtained from the imperial gov. whether to bring the maritime provs. to the lakes or for opening up the W. before the Amer. could get there for their own commercial benefit. Hence the methods of H. as a railway promoter were coarse, but he was a first-rate business administrator in politics, though, being a man of crude sensibilities, he hardly emerges in Canadian hist, as a very interesting figure. The most instructive period of H.'s political life is before 1851, when he was occupying himself in building up the Reform party as the instrument through which responsible gov. was to be secured. On his return to Canada in 1869 he was at on in roturn to Canadian in 1700 ne was aconce pressed into service by Sir John Macdonald as finance minister—a tribute to his recognised ability. But he had by then lost touch with Canadian affairs and resigned in 1873, and it was an years after that the he hereman president of the file. that that he became president of the ill-fated City Bank of Montreal. H. pub. Reminiscences of his public life in 1884. In 1907 Stephen Leacock pub. the life of II., in the 'Makers of Canada' series. R. S. Longley's Sir Francis Hincks (1943) is not so much a biography as a ' study of Canadian politics, railways, and finance in the nineteenth century.'

canada politics, talways, and maner in the nineteenth century."

Hinomar (c. 806-882), archishop of Rheims from \$15; was educated in the abbey of 5t. Denis, and held the abbacies of Compiègne and 5t. Germain before he attained to his archibishopric. He was a bitter opponent of Gottschalk, the refractory monk and champlou of predestination and exposed his herestern a series of theological polenics. At metropolitan, he had excommunicated his suiragan bishop, Rothad; by eventually reinstating the offender, he undoubtedly encouraged papal autocracy. Yet in the matter of the sovereight of Lorrame he boldly refused to countenance Pope Adrian's interference.

Hind, name given to the female of

Hind, name given to the female of Cereus claphus, the red-deer, a ruminant ungulate mamual belonging to the Cervides; hart is the correlative term for the

male.

Hindemith, Paul, Ger. musician, b. at Hanan, 1895. Studied at Frankfort. Viola-player and conductor in the Frank-fort Opera House orchestra From 1927, prof. of composition at the State High School of Music, Berlin. As a composer School of Music, Berlin. As a composer he is important and prollific in the modern Ger. school, and has written much chamber music, operas, song-cycles, including Die junge Mayd, and one-act operas, among them sanda Susanna and Cardillac.

Hindenburg, Paul Ludwig Hans von Beneckendorf und von, (1847-1934), Ger. soldier and President of the Ger. Republic, bat Posen. He came from the Beneckendorf stock, which took the name of Hindenburg in 1789. The majority of his immediate ancestors had been soldiers, and he claimed himself to be 'the son of a soldier.' His father at the time being a lieutenant in the 18th Infantry Regiment. Gen. Schwichart. In 1859 he entered the of chivalry among his officers, efficiency Cadets' Academy at Wahlstatt and in 1865, became a 2nd Lieut. In the 3rd ideal of service generally. He was particularly paign was the Austro-Prussian of 1866, in propie of Oldenburg, whose manners paign was the Austro-Prissian of 1866, in which he was wounded in the head. He was a deeply religious man, simple and direct, and his conduct during his first spell of active service gave evidence of these qualities. He gained the Order of the Red Kagle (4th Class) with swords for his services. On the outbreak of the

PRESIDENT VON HINDENBURG

Franco-Prussian war of 1870-71 he was adjutant of the 1st Battalion of his regiment. He showed his feurlessness in this campaign by carrying out his duties with an utter disregard of the shot and shell flying about him. In 1873 he entered the Kriegsakadome, joined the General Staff in 1878, and was promoted captain. He in 1678, and was promoted captain. In was posted to the Headquarters Staff of the 2nd Army Corps at Stettin. Here he married the daughter of Gen. von Speining. He had three children—one son and two daughters. In 1881 he was transferred to the 1st 10v. at Königsberg. where he was fortunate to serve under the Vernois, to whom he owed much, and in 1886 he came under the influence of the great Moltke, to whom he was also in-debted. In 1889 he transferred to the war ministry, and took over a section of the common war dept. His former chiof

of chivalry among ins onlevers, embendy and discipline in the battalions, and a high ideal of service generally. He was particularly happy among the quiet, homely propie of Oldenburg, whose manners strongly appealed to him. In 1896 he was appointed Chief of Staff to the 8th Army Corps at Koblenz, to the command of the 4th Army Corps in 1905, and retired from the service in 1911. On the outbreak of the war of 1914, he was not immediately recalled to active service, but the retreat of the Eighth Army in E. Prussia demanded a new commander, and H.'s acquaintance with E. Prussia marked him out for appointment in preference to Ludendorff. Soon afterwards he won the victory of Tannenberg (q.v.) over Samsonoff and, turning against the army of Rennenkampf at the first battle of the Masurian Lakes, routed that general too. Masurian Lakes, routed that general too. He was then promoted to be commander of the Eighth and Ninth Army Group which Falkenhayn was leading against the Russians in Poland. The Ninth Army reached Warsaw but the Eighth was forced to withdraw to the Masurian Lakes again, to withdraw to the Masurian Lakes again, and it was only when he received the Tenth Army as reinforcements that H. again defeated the Russians at the Masurian Lakes. Already made a field marshal, his fame was now greater than that of von Mackensen, whose Austro-Ger. armies, in the middle of 1915, had driven the Russians out of both Galicia and Poland. In 1916, after the battle of the Somme, he was transferred to the W. Front, being given the supreme command the Somme, he was transferred to the W. Front, being given the supreme command of the Ger. Field Army, with Gen. Ludendorff as his First Quartermaster Gen. He organised the retreat to the famous Hindenburg (or first Siegfried) Line, while abandoning the offensive against Verdun. But he won no other great victory and, on Nov. 11, led his armies into Germany, a defeated communider, but with his spirit unbroken and having to his credit the successful planning of a great retreat, followed by an orderly demobilitation. By no means a brilliant strateriet. It was a sound general orderly demobilisation. By no means a brilliant strategist, II. was a sound general

brilliant strategist. H. was a sound general and steadfast in purpose
There seems little doubt that his victories were achieved largely with the advice of Gens. Ludenderfi and Hoffmann. After the Armstree, he retired to Neudeck. Despite the defeat of Germany, H. remained a legendary figure with the Gerneople, who had never forgotten their Russdan invaders. In 1925 he was elected President of the Ger. Republic in succession to Ehert. A monarchist at heart, it sion to Ebert. A monarchist at heart, it was believed that he might support the restoration of the monarchy; but he had a high conception of duty and of loyalty, and he followed a strictly constitutional groat Moltke, to whom he was also in and he followed a strictly constitutional debted. In 1889 he transferred to the course, until the economic crisis and the war ministry, and took over a section of the course, until the economic crisis and the var ministry, and took over a section of course, until the economic register at the time. Here he was engaged in drawing the field ongineering regulations and determined by means of emergency and ruled by means of emergency decrees; he became the object of bitter tails connected with heavy artillery. In 1893 he was appointed to command the refused to accept as Chanceller. In 1893 he was appointed to command the refused to accept as Chanceller. In the always endeavoured to outlivate a sense!

of thought and restraint. See life, 1936, by Major Hindenburg, his nephew.

Hindenburg Line, otherwise Siegiried Line, name given to the line of field fortifications taken up by the Ger. armies in their retreat or withdrawal following the battle of the Somme, 1916. The withdrawal was, to some extent, an acknowledgment of defeat on the Somme; but with characteristic resourcefulness, the Ger. High Command had prepared the field fortifications and works of this line so as to constitute it the most formidable detensive system theretofore evolved by the skill of military engineers. Its alternative name, Siegfried Line, was equally designed to inspire the Ger. soldiers to hold the system at all costs; and the fact that the Ger. High Command really believed the time to be impregnable is to be gathered from Orders of the Day, as e.g. No. 111, dated Sept. 18, 1918. Yet even in 1917 the Brit. forces began a drive on Nov. 20 towards Cambrai, which for a time threatened to plerce the H. L. and eyen to terminate the deadlock on the W. Front. (See also Bourlon Wood); CAMBRAI: FRANCE AND FLANDERS, FIRST WORLD WAR CAMPAIGN IN.) The H. L. was eventually smashed by the Brit. forces in Sept. 1918, following the successful piercing of the line at its strongest point, the Drocourt-Quéant (n.r.) Switch. Hinderwell, par. and fishing vil., N. Riding, Yorkshure, England, 9 m. N.W. of Whitby. There are iron mines. Pop. 2100.

Line, name given to the line of field fortifleetions taken up by the Gar armies in

The close sellance and interestion between The close alliance and interaction between Brahmanism (q.v.) and H. make it impossible for a strict line of demarcation to be drawn from a chronological or a sec-tarian point of view. H. may be said to date roughly from about the sixth century, when the local revolts of the latty against Brahmanic supremacy culminated Brannahu supremacy cummacut in Buddhism and Jainism. Until then the authoritative doctrine of pantheistic belief formulated by speculative theologians during the centuries succeeding the Vedic period had held sway; these revolts had the effect of rendering Branchism and the effect of rendering Bra revoits had the effect of rendering Brahmanism still more tolerant, although its erstwhile severely metaphysical and ritualistic rigour had previously been modified by the currents of Sivaite and Vishnuite thought. The doctrine of the Trinurti, or Trinity, was often put forward under the influence of Upanishad monism. Brahma the creative principle ward under the influence of Upanishad monism. Brahma, the creative principle of the universe; Vishnu, the conservative principle; and Siva, the destroying, but also the generative, principle, are represented as a Trintv of equal and identical deitics. Early Brahmanism and Buddhism co-existed down to about A.D. 800 when the latter disappeared from the peninsula, leaving a new Brahmanism, the product of the two philosophiles. This modern H., based on the Puranas (see Purana) gives less prominence to Brahma than to his associates. Vishnu and Siya. than to his associates, Vishnu and Siva. To the vast majority of Hindus some form of either Vishnu or Siva is the highest source of all existence, and the object of supreme adoration. The subdivs. of the Vishnuite sects range from the broadest pantheism to extreme sectarianism. cult of Siva affects the two extremes of society; he is favoured by many high-class Brahmans and metaphysical ascetics, and also by the lowest classes. The reason for this is that he is regarded not only as a mystic miracle-working deity, but as a blood-loving, awe-inspiring god. The Sakla movement, the worship of Siva's wife, under various names, as the cosmic energy of the universe, is closely allied to Siva-worship. The whole ground of lindu sectarianism is by no means covered by those broad outlines; many miscellaneous cults exist which are still included under the general term H. The pantheon of the latter finds room for hosts of minor deities, which are in the main accepted both by Vishnuites and Sivaites. Closely allied and interwoven with all the crosery anied and interwoven with all the sects of H. is the system of caste. The infinite variety of caste-divs., each with a social and religious organisation of its own, was evolved from its beginnings in the the Vedic age by the Brahmans. For details, see under India. Although H. has Hinduism, comprehensive term which is preserved numberless myths, and has inused to designate not only the social customs, but the religious beliefs of the majority of the peoples of India. The actual truths from nature and the universe. Its main planks, the doctrines of 'Karma' (works). 'Samsāra' (wandering, i.e. (works), 'Samaara' (wandering, i.e. metempsychosis), and 'Moksha' (release and absorption, or union, with the Infinite) may seem fantastic to the European mind; but the Hindu mind is essentially mystic and transcendental, regarding all finite phenomena as avaneagent and absorption, or union, with the Infinite) may seem fantastic to the European

Hindu Law is theoretically of divine origin, and cannot be changed by human igency. The books which lay down the liw, the Shestras, are of very anct. origin, and the state of society in the time in which they were written was quito unlike that of the present time. Consequently, they exact takes which no sequently they enact tules which no Hindu follows, and do not give any pronouncement on many things which need regulation. The chief agents in changing the operation and scope of the law are custom and different interpretations, as a laid days in comparative. laid down in commentaries. Legislation has not been employed, although the Brit. parliament and the Hindu legislatures Bouquet, Hinduium, 1919. See also Ary Samaj. Brahmanism, India, Siva, Wishinu, etc.
Hindu-Kush, name of a mt. chain of Central Asia which, for 200 m from its E extremity, forms the S. frontier of extremity, forms the S. frontier of Afghanistan. It is the great watershed between the Kabul and the Oxus basins,

were binding were the writers of com-mentaries, but the Indian courts will not mentaries, but the Indian courts will not accept the opinions of modern commentators, although their own rulings are binding. Thus different schools of H. L. have arisen, which may be divided into two main branches, that of Benarcs (including those of Bombay, Dravida, and Mithila, for W. India, S. India, and Nepal, respectively), and that of Bengal, or Gavinja. The most important books laying down the law are: the Laws of Manu the Smitri of Yaghavalkya, and the Smitri of Naruda. More important still are the commentaries which are not sacred: the Milasshara of Vijnancsurva, on the Smitri of Yahgaralkya, is the commentary which exercises the most influence, though in the valley of the Ganges the Dayabhaga of Jimularahana, in S. India the Smitri Chandraka, in W. India the Vigharahara Mayukha, and in Mithila the Vigharahara Mayukha, and in Mithila

Hindus, Maurice Gerschon (b. 1891), Russo-Amer. author; a native of a Russian vil., who became a distinguished Amer. man of letters. He migrated to the United States in 1905 and graduated from Colgate Univ. in 1915. He has frequently congate Only in 1915. He has requently revisited Russis and returned there after the Civil war to see the progress of the collectivist experiment in agriculture, with which, indeed, he was in sympathy. An account of what happened in the course of the collectivisation of the farms will be doubt in the terms. will be found in his two very remarkable novels Broken Earth (1926) and Red Bread novels Broken Earth (1926) and Ited Bread (1931), in which latter he describes the collectivisation of his old vil. (see also Kulak). His other novels include: Humanity Uprooted (1929), The Great Offensive (1933), Moscow Skies (1936), and Sons and Fathers (1940). His non-fictional studies of Russia include The Russian Peasant and Revolution (1920), IVe Shall Live Agan (1939), and Mother Russia (1943). Green Worlds (1938) is an autobiography of his youth.

Russia (1943). Green Worlds (1938) is an autobiography of his youth.
Hindustan, or Hindostan, means the 'country of the Hindus.' The Persians used to call the R. Sindhu 'llindu.' and that part of the dist. was therefore called H. The region denoted was gradually extended, until the whole tract of country between the Himalaya Mts. and the Vindhya Mts., W. of Bengal, was so designated. At one time H. was often used as a name for the whole of India, but is now seldom used either with such extended.

used as a name for the whole of India, but is now seldom used either with such extended or the old very restricted meaning. Hindustani Language and Literature. H. is the name given by the Eng. to Uriu, an Indian dialect; but H. proper includes the many Indian dialects in existence in Hindusten, such as E. Hindi, W. Hindi, and Hajasthani. Muhammed Husain Azad

maintains that Urdu is derived from Brit Basha, a variation of W. Hindi, but it is almost certainly a sister dialect, both being descended from Saur Senic Prakrit. II. or Urdu, meaning 'camp language,' originally derived this name from being the language spoken by the soldiers camped near Delhi, which was the centre of Moslem rule. It is now spoken in the neighbourhood of Delhi and Meerut. Modern High Hindi was developed from Urdu, but for the many words of Persian origin words of Sanakrit origin have been substituted, Sanakrit really being the substituted, Sanskrit really being the original language, and in consequence the literary languages of Urdu and High Hindl have become widely different. Urdu was originally a simple language, sufficient to the needs of the peasants. It did not become a literary language until the sixteenth century, and under the influthe sixteenth century, and under the influence of their Mohammedan conquerors the Urdu application in Persian literature. The Urdu alphabet is practically identical with that of Persian and Arabic, and is written in Arabic characters. Urdu writers borrowed both form and imagery from Persian poetry, while their prose is also largely imitative of Persian prose. During the time of of Persian prose. During the time of Akbar (1556-1605) It was compulsory that all gov. clerks should know Persian, and from this date the Urdu language became more standardised. From the sixtenth century onwards European languages, chiefly Portugueso and Eng., have also influenced Urdu. In Urdu provody there is no accent as in king., but only vowel quantity. Rhymo (qaju) and double rhyme (radi) are greatly used. There are fifteen standard metres, while the prin. kinds of verse are ghazal, an ode; of quanta, a purpose poem; qua, a fragment of quanta or ghazal, but differing from them in rhyme and often used for didactio poetry; ruba; a quatraly iorn; mamari, double-rhymed, used for bullads, epica, and romances; mustcad, a poem in which a few words are added to each line beyond the length of the metre; murabba, rhyming hemistichs in sets of four · mukhammus, rhyming hemistichs in sets of five; musaddus in sets of six and others such as musabla in sets of seven. Wasokht, burning backwards, is a love poem in which the poet complains of the heedlessness of his beloved, and larikh is a chronogrammatic poem, while fard is a single verse used as a quotation. The earliest form of Urdu literature is poetry, and Amir Khusra is the first known poets, writing in the thirteenth century. The two most celebrated of Urdu poets—Raf. Sauda, the satirist, and Mir Taqi, the narrative poet and someter—lived in Delhi in the eighteenth century. There are such as musabba in sets of seven. Wasokht, in the eighteenth century. There are three kinds of Urdu prose: ari, naked and unadorned; murajjas, cadenced, using unadorned; murajjas, cadenced, using metre without rhymes; and musajja, in which rnyme is used without metre. There are also three kings of nasr musajja or rhymed prose. Early Urdu prose is marred by the frequency of its Jingling rhythms, and it was not until the nineteenth century under the influence of Ghalib and Sir Syed Ahmed Khan that it became free of rhymes and the long, com-ulicated Persian constructions. Fictions, as distinct from romances, together with journalism did not come into existence until the end of the nineteenth century, and then under Eng. influence, while Urdu drama is still in its infancy.

Hine, Reginald Leslie (1883-1919), Eng. lawyer and historian of Hitchin, b. at Newnham, Hertfordshire. A scholar of great ability and skill, and a writer and locturer of charming and gracefully allusive style, who devoted his gifts chiefly to the community limited would style. the comparatively limited world of local tn. and co. hist. Hitchin was H.'s special study, to which he gave himself intensively for many years. Reyond it, he had many wide interests: in the co. of Hertford-shire, on whose hist, he was engaged when shire, on whose hist, he was engaged when he died by suicide, and in Eng. hist, and traditions in many directions. His writings include: Lyra Celtica (1912), Dreams (1913), The History of Hitchin (2 vols. 1927-29), Samuel Lucas, Life and Art Work (1928), A Mirror for the Society of Friends, Being the Story of the Hitchin Quakers (1929), Hitchin Worthes (1932), The Natural Instory of the Hitchin Region (1934), Confessions of an uncommon

Hinsley, Arthur (1865-1943), Eng.
cardinal, b. at Carlton, near Selby, Yorkshire. Educated at Ushaw and passed
to the Eng. College at Rome. Took a
doctorate at the Gregorian Univ. and
returned to Ushaw as a prof., 1893. In
1889 he became headmaster of St. Bede's
Grammar School. Bradford. Transferred Grammar School, Bradford. Transferred in 1904 to the archdiocese of Westiniuster In 1917 as parish priest of Sutton Park. he was chosen to be Rector of the Eng. Col-

lege in Rome. Created bishop of Schastopolis in partibus, 1926. In 1928 he was appointed to the post of 'Apostolic Visitor to the African Missions in Brit. Territory' and secured the co-operation of the Rom. Catholic missions in schemes of educational reform in all parts of Brit.
Africa, being created, in 1930, Apostolic
Delevate in Africa and titular archibishon
of Sardes. He will be runembered as one of the more significant of those men who have influenced Africa for good, especially as he represented the Pope in the Fr. colonies as well as the Brit. In 1934, after colonies as well as the irrt. In 1934, atter a serious illness, he was crosted a canon of St. Peter's, but at the age of sixty-nine, was chosen to succeed Cardinal Bourne in the See of Westminster. Went to Rome in connection with the canonisation of the Eug. martyrs Thomas More and John Fisher. At the end of 1937 he was raused to the seared college with the title raused to the sacred college with the title of santa Susanna. Held strong views on the subject of the persecution of the church in Russia, Mexico and Spain, and, later, turned his powerful oratory against later, turned his powerful oratory against New paganism. After the fall of France in 1940 he founded a new society, 'The Sword of the Spirit,' for mobilising ('atholics to promote, as a religious duty, the victory of the allied arms, and the reconstruction of Europe. Had an engaging personality, which made him beloved by all who came in contact with him. Hintestand Ger would expressing the

Hinterland, Ger. word expressing the country which lies at the back of colonies which, in an unexplored continent, naturally grow up near the coast. It is connected with a theory of colonial expansion. Most early settlers, like those in N. America and in Africa, assume rights are much wider area than that which they have so far developed or explored. Thus those Eng. colonists who had peopled a mere coastal strip arrogently claimed unsidiction over vast regions W. of the Ut. sissippi, and were not slow to show their resentment at what they regarded as the injustines appropriations of Fr. explorers along that riv.'s course. The theory about the 'hinterland' made a very strong appeal to the Ger. emigrants of Bismarck's day.

Hiouen-thsang, see Hwen Phaned. Hip-joint, ball and socket joint (enarth-ross), somewhat resembling that of the -houlder but with considerably less extent on movement. The pelvis socket (acotabu-lan) is considerably deeper than is the case in the glenoid cavity of the shoulder joint. The investing membranes and tissues are also much less lax than those of the upper limb, and in consemonce the whole is considerably stronger. 'ine capsule has three well-marked investing bands: (1) The ligament of Bigelow, which is mainly concerned in the maintenance of the creet position of the hidy, is particularly strong and seldom riptures, even in cases of the dislocation of the joint. It is in the form of an inverted Y, in which the upper part is attached to the illum and the limbs of the Y are fastened to two distinct portions of the head of the femur. The other ligaments connect the femur with the pubis

and the ischium respectively. The ligamentum teres or round ligament passes from a slight fossa in the spherodial head of the femur to the interior of the acc-tabulum. This ligament, on account of tabulum. This ligament, on account of its situation, has been the subject of much discussion. It is absent in some mammals. Gripping the head of the femur is the cotyloid ligament, which lies inside the capsule and deepens the margin of the socket; it is continued as the transverse ligament. The synovial cavity extends along the neck of the femur beyond the limits of the auricular carti-

 Capsular ligament.

Diseases.—The H. is peculiarly subject to many of the diseases which attack joints. Hip disease has been definitely associated with scrofula, and the symptoms of it usually appear before puberty. Failing satisfactory treatment the disease passes through well-marked stages, and anally dislocation may result from the breaking down of the surrounding tissues, which is frequently accompanied by a fungoid growth from the base of the acetabulum, which growth pushes the head of the femur from the socket; the whole may be rendered immovable (anchylosed), and although cases occur in which a permanent lateral displacement and shortening of the limb on the proof and shortening of the limb are the most serious consequents, yet more frequently the characteristic tubercular infection of the synovial membrane supervenes with dire results. Accidental dislocation is not frequent, largely due to the depth of the cavity and the general strungth of the joints. In adults such dislocation is often joints. In addite such discovering the order accompanied by a fracture of the lead of the femur; its rarity of occurrence is partly neutralised by the nuch greater difficulty which is experienced in reducing this dislocation. Congenital dislocation. this dislocation. Congenial association, which may be double, may be caused by the position of the child during intrauterine life. The dislocation may not be discovered until walking commences, when the peculiar rolling gait will hint at tt. X-ray examination is necessary in order to discover whether a hollow exists

in which the head of the femur may be placed, otherwise the treatment is much more difficult and may even demand much more difficult and may even demand the artificial construction of a socket. Rheumatoid arthritis often makes its appearance at the H. which, in certain cases, it renders totally inoperative. Hipparchus, see HARMODIUS. Hipparchus (c. 160–120 n.c.), founder of scientific astronomy, b. at Nicrea (in Bithynia), and lived in Rhodes and Alexandria. His greatest discovery was that of the precession of the conjunction

that of the precession of the equinoxes, but he also investigated the true periods of the revolution of the moon and of the of the revolution of the moon and of the solar year, and showed how places might be more accurately located on the globe with reference to the lat. and long, of stars. To H. also are traceable the beginnings of trigonometry, both plane and spherical. It is only recently that the true greatness of H. has been appreciated, as Ptolemy had for centuries the credit of his predecessor's observations.

See H. Berger, Die geographischen Frag-menie des Hipparchs, 1870. Hipparlon (Gk. im-apo., a pony), name of a genus of extinct fossil ungulate mammals belonging to the sub-order Perisso-dactyla and the family Equide, and found dacty la and the family Equidic, and found in the Upper Miocene and Pilocene strata of Europe, N. America, and Asia. This animal is usually regarded as one of the ancestors of the horse, though differing considerably in structure and size. The li has three toos, the outer digits not reaching the ground, the ulna being better developed than in the horse, and its last return less than the formal than the property of the strategy of the strategy of the size of size is rather less than that of a donkey.

Hipper, von (1863-1932), Ger. admiral. At the outbreak of the First World War he was in command of the 2nd squadron of ne was in command of the 2nd squadron of the Ger. High Sea Fleet. At the battle of the Dogger Bank (q.r.) in Jan 1915 he commanded the Ger raiding cruisor squad-rons. At the battle of Juliand (q.r.) in May 1916 he was in the Latzor as Chief of the Reconnaissance Force, an appointment of great responsibility, which he ably filled. Heaucreeded von Scheer as commander-inchief of the Ger. Fleet in Aug 1918, and it fell to him to make the arrangements with the Brit. naval authorities regarding the surrender of the Ger. Fleet. He re-ceived the freedom of Wilhelmshaven for his Jutland services. See life by H. von Waldeyer Hartz (trans. by F. A. Holt), 1933.

Hipperholme, par and tn., W. Riding, Yorkshire, England, 2 in. N.E. of Halifax.

Quarries and tanneries. Pop. 5300. Hippias of Elis, Gk. sophist, contemporary with Socrates, who taught in Athens and figures in the *Hippias Major* of Plato as a man puffed up with his own concent. In learning he was a pedant; in literature a dilettante who tried his hand at every form of composition. Once at the Olympic games he boasted he had

at the Olympic games he boasted he had made all his apparel and was master of every mechanical as well as liberal art.
Hippius, Zinaida Nicolayevna, (1869–1945), Russian authores: b. at Roley, Tula prov. Married, 1889, Dmitry Merezhkovsky (q.v.), and belongs to his 'symbolist' school of poetry—fashionable

in their youth. Works:—three vols. of poetry; five of short stories; novels (e.g. New People and The Devil's Doil); essays; La Révolution et la violence—la vrate force du Tsarisme (in collaboration with D. S. Merezhkovsky and D. Filosofov, 1907) one play, The Green Ring (Eng. trans., 1920); and My Journal under the Terror (i.e. in Leningrad after the fall of Tsarism — Fr. trans. 1921). Works :-- three vols. of -Fr. trans. 1921).

Hippocampus, name of a genus of teleostean fishes belonging to the family Syngnathide and commonly called sea-

horses.

Hippocras, or Vinum Hippocraticum. old aromatic medicinal wine, prepared from spices, such as cinnamon, ginger,

lemon peel and almonds mixed with white wine and sweetened with sugar or honey. Hippocratea, chief genus of the order Hippocrateaceee, and was named after Hippocrates, despite the fact that the species have no medical value. The species are twining shrubs indigenous to the tropics.

Hippocrates (c. 460-c. 357 B.C.), celebrated Gk. physician, a native of the is, of As a youth he is said to have studied the tablets in the temples of the gods, where each person had inscribed the allments from which he suffered and the means by which he had recovered. beginning of the Peloponnesian war he is said to have seven athens from a dreadful pestilence. Subsequently, on being invited to the court of Artaxerxes, he patriotically refused and said that he must servo his own country. He was given the civic privileges of Athens, and rewarded with the golden crown. He travelled widely throughout Greece, and died at Larissa in Thessaly. His two sons, Thessalus and Dracon, and his son-in-law, Polybus, all followed the same profession. He was a careful and observant thysician, and a strong believer in surgery. The presence of disease, he believed, was due to a wrong proportion in the body of the humours, which he classified as phlegm, blood, and black and yellow bile. The chief works attributed to him are: Aphorisms, Promostics, and About, Air, Water and Places. The best known edsare: Fossius (Geneva, folio, 1657); E. Littré (10 vols., 1839-61), with Fr. trans.; Ermerius, 1859-63 (with Lat. traus.), and the Eng. trans. of Adems. 1819. and He was a careful and observant physician, the Eng. truns. of Adams, 1849, and W. H. S. Jones, 1923. See also F. Jevons, History of Greek Legrature, 1886.

Hippoorene, see Hvilcon,

Hippodrome (Gk. iπποδρίμος from iππο,
horse, and δρόμος, racecourse), course
used by the anct. tike. for chariot or horse
racing. It was much wider than the Rom. circus, and was usually made on the slope circus, and was usually made on the slope of a hill. Its length varied from 650 to 750 ft., and it was about 450 ft. wide. In shape it was oblong with one semicircular end, and the right side was somewhat longer than the left. Homer gives a fine description of a chariot-race, and shows that the critical point of the race was to turn the goal as sharply as possible, with the nave of the near wheel almost grazing it and to de this early. it, and to do this safely.

Hippodrome, London, place of amuse-ment which was opened at the beginning ment which was opened at the beginning of 1900. It affords a good entertainment, which is a combination of that given at a music hall, circus, and hippodrome. A feature of past performances was an aquatic display, for which the building is specially adapted. The arena can be filled with water to a depth of \$ ft., and has a capacity of about 98,000 gallons. In recent years only review have been In recent years only revues have been produced.

Hippogriff, or Hippogryph, fabulous animal, unknown to anct writers, represented in comparatively modern literature as a winged horse with the head of a griffin, and described as the horse of the Muses. It was used by Arlosto in his Orlando Funoso, and by many writers of

the Renaissance.

the Kensiasance.

Hippolyte, in anct. Gk. legend, the queen of the Amacons. She was the daughter of Ares and Otrora, and the sister of Antiope and Melanippe. She headed a troop of Amazons in pursuit of Antiope, but was defeated and fied to Megara, where she died of shame and grief According to another version. Megora, where she died of shame and grief. According to another version, after her defeat she became the wife of Theseus. Still another tradition recounts the still another tradition recounts. that Theseus slew her in order to become possessed of her girdle, the gift of Area.

presented of ner girdle, the gift of Area, Hippolytus, in anct. mythology, the son of Theseus, by Hippolyte or Antiope. His step-mother, Phædra, fell in love with him, and, on his refusing to gratify her desires, complained to Theseus that he had made attempts on her honour. His father thereupon cursed him and besought Possidary and to being alout his destruction. l'oseidon's aid to bring about his destruc-tion. While H. was riding in his chariot by the sea-shore, Posledon sent from the water a sea-bull which frightened the borses, so that the charlot was overturned and H.'s body dragged along the ground till he died. According to Virgil, Artomis persuaded Æsculapius to restore him to life, and placed him under the care of Egerla in the grove of Arica in Latium. He is the hero of Euripides' play of that

namo. Hippolytus (c. A.D. 160-236), an early Christian writer, supposed to have been Christian writer, supposed to have been bern in the East and to have become a disciple of Ireneus. Very little is known about his life. He became a presbyter of the church at Rome in the time of Bishop Zephyrinus (193-217). Ye disagreed with the succeeding bishop, Calixtus I., with the result that there was a schism, when apparently H. became the head of a separate church and styled himself Bishop of Rome. In 235, during the nersecutions of Rome. In 235, during the persecutions of Maximinus, the Thracian, he was exiled to Sardinia, where he died in the following to Sardinia, where he died in the following year. Origen ascribed to bim the Philosophumena, with which has been identified a fourteenth century MS., found in 1842 and published in 1851. His works have been collected by Fabricius (1716–18) and Lagarde (1858). See studies by C. O. J. Bunson, 1852; C. Wordsworth, 1852; J. Dollinger, 1853; H. Achells, 1897; A. d'Ales, 1906; and A. Donini, 1925.

rent the goods to be me the property
of the hirer if he pays the whole of the
metalments By the terms of some agreements the so called 'hirer is bound to
pay for and purchase the furniture, which is therefore his property ab unitu, subject to the obligation to pay on easy terms. But usually Hs are so drawn as to reserve the property in the goods in the vendor until all the instalments have been paid, the hiror, properly so called, being under no obligation to purchase. The disadvantage to the hiror in this latter form of II. is that if he does not keep up his instalments, or exercise his option to purchase, the vendor is entitled to selze the goods and keep the whole of the pavments already made to him. Most firms who sell goods on 'easy terms' have printed forms of Hs., and it is essential theroughly to master the details of the agreement before signing it, so as to avoid hability in the event of inability to keep up instalments. Abuses of the system long excited complaints, and in 1938 an Act was passed giving the birer protection. from unreasonable demands and conditions, and allowing for the termination of an agreement by roturn of the goods hired after a specified number of instalments has been paid. The Hiro Purchase Act, 1938, applies to all Hs. and credit-sile agreements under which the hiro-purchase price or total price, as the case may be, does not exceed (a) for a motor vehicle or railway wagon, £50; (b) in the case of livestock, £500; (c) in any other case, £100. Before any agreement is entered tioo. Before any agreement is entered into, the owner must state in writing (otherwise than in the note or menio of agreement) a price (the 'cash price') at which the goods may be purchased by the horizontal buyer for cash; but this reprospective buyer for cash; but this requirement is an lantly compiled with if the liner has already mapected the goods and also if they were labelled with the price or he has selected the goods from a proced and also if they were labelled with the price or he has selected the goods from a priced catalogue. An owner cannot enforce a H. or any contract of guarantee iciating to it or any right to recover the goods from the hirer, and no security given by the hirer or by a guarantor for him will be enforceable against the hirer or guarantor unless the requirement as to stating the price has been complied with; and also unless a note or menio of the agreement is made and signed by the hirer and by all other parties to the agreement; and the note or memo must contain a statement of the hire-purchase price and of the cash-price and of the amount of each of the instalments and of the date on which each instalment is payable, and it must contain a list of the goods to which the agreement relates sufficient to identify them. A copy of the note or memo must be delivered or sent to the hirer within seven days of the making of the agreement. The Court, however, has a discretionary power to dispense with some of these requirements if the hier has not been projudiced by the failure of the owner to comply with them. There are analogous provisious on the statutory requirements relating to credit-side agreements where the total purchase price exceeds 25. A third ran, at any time before the final payment under a II. falls due, determine the agreement by notice in writing to any porson entitled or authorised to receive the sums payable under the agreement. He will be liable, without prejudice to any liability which has accrued before the termination, to pay the amount, if any, by which one-half of the hire-purchase of a thriving commerce, though with price exceeds the total of the sums paid comply with them. There are analogous

and the sums due in respect of the hirepurchase price immediately before the termination, or such less amount as may be specified in the agreement. Where the hirer, having determined the agreement, wrongfully retains possession of the goods, then, in any action by the owner to recover them, the Court may order the goods to be delivered to him without giving the hirer an option to pay without giving the inter an option to pay the value of the goods. Knowingly selling or pledging goods not completely paid for under a fl. which does not vest the property in the hirer ab initio may render the hirer liable to prosecution for latteny as a ballee. A H. under which the goods remain the property of the vender till full payment is not a bill of sile within the meaning of the Bills of sale Acts and therefore the goods not being within the hirer's 'apparent being within the hirer's 'apparent possession,' may not be selzed in execution possession, may not be selzed in execution (q.e.) by the hirer's creditors, and they cannot, generally speaking, be distrained upon for rent owing in respect of the premises in which they may happen to be. The hience to selze frequently inserted in such H. As, merely combles the vendor to retake what is his own property in the cvent of non-payment. The goods of a bankmunt trader delivered under a true bankrupt trader delivered under a true H or hire-purchase agreement vest in his trustee in bankruptev and form part of the assets available for his creditors generally, unless there is a well-recognised custom in the bankrupt's trade to hire goods of the kind comprised in the H. A if r quires a 6d. stamp, and it under seal (see DEED), a 10s. stamp.

Hirolito (b. 1901), Emperor of Japan, puring the title Dai Vippon Telkoku Jenno, or Imperial Son of Heaven of Great Japan. Descended from a dynasty that is believed to go back to the middle of the seventh century B.C. Educated partly in England; succeeded his father vehibito in 1926. Married Princoss Agrako in 1924. Akilhto, lis eldest son, a Crown Prince. Held the Brit, honours is from Frince. Head the Brit. Bonours & G., G.D., and G.C.V.O. After the defeat and surrender of Japan in the Second World War, a new draft con-stitution (Aug. 1946) profoundly changed the status of the Jap. Emperor. The constitution rests on the foundations of the state not, as theretofore, upon divine mandate, but upon the will of the elec-torito: and it restricts the functions of the Emperor, who becomes a symbol of the State

This is, of quake. These, even when virtually woods and crags is famous for the great under the explosion, usually suffered no Light, Miyajima, which rises from the ploturesque bay opposite. This is. of woods and crags is famous for the great woods and crags is famous for the great temple of the goddess Bentin (begun in 587), which is accounted one of the three wonders of Japan, and was yearly thronged by a multitude of pligrius. The name of this ill-starred city, however, will go down to hist, as that of the first victim of the terrible atomic bomb. On Aug. 6, 1945, shortly after 8 A.M., an Amer. Super-Fortress flying at 30,000 ft. dropped a single atomic bomb over the city and the bomb exploded over the city centre. The city centre, once the Cold Tn., was dominated by a number of reinforced concrete buildings owned by banks, insurance companies, department stores, newspapers, and similar mercantile enterprises. Beyond the Old Tn. lay an industrial zone developed during the early part of this century, and consisting of many small wooden workshops set among dense Jap. houses. A few larger plants devoted to engineering and silk manufacture lay on the S. and W. outskirts of the city. The city was a prosperous trading community having some contacts with the outside world, and its centre was spadously planned, with tine streets and temples. Like other Jap. cities. It was temples. Like other Jap. cities, H. was growing rapidly before the war; its census pop. rose from 270,000 in 1970 to 315,000 in 1940. It remained at this figure for the greater part of the war, but began to fall in 1914, and at the time of the attack it was below 245,000. This fall was the result of evacuation, in the main compulsory and accompanied by the systematic destruction of houses to form fire breaksa programme to which impetus had been a programme to which impetus had been given by the great incendiary raids on Tokyo and other Jap. cities in the second week of March 1945, and the process was only partly completed in H. when the atomic bomb fell. The result of the explosion of the bomb was catastrophic and it was soon followed by the dropping of a second atomic bomb on Nagasaki and the conding of the programme and the conding of the programme. ending of the war, towards which the two bombs largely contributed. In H. the bomb exploded above a level expanse of bomb exploded above a level expanse or more than 10 sq. m. of wooden houses, destroying over 4 sq. m. first by blast and then by fire. The strong reinforced concrete buildings which dominated the centre of the city usually resisted the blast, but were burnt out. The modern industrial zone outside the city, at 1 i m. and more from the centre of damage, was beyond the range of severe blast. It is beyond the range of severe blast. It is officially estimated that approximately 80,000 persons were killed. The severity of the disaster (as also at Nagusaki) was increased by a panic flight of pop., in which even fire and rescue services were abandoned and which brought carnward. which even fire and rescue services were abandoned, and which brought communal life virtually to a standstill. The mere clearance of debris and the cremation of the dead trapped in it had to wait a month for the return of the pop. Most striking of the blast affects was the distortion of all types of building as a whole, leaving them leaning as if after a high wind rather than an explosion. Many of the reinforced

serious atructural damage except some depression of the flat roof, sometimes to saucer shape. As might have been expected from a bomb exploded at such a height, the effect on underground services was insignificant. Similarly, roads and railway tracks were unaffected. Bridge-were displaced but usually by very small amounts. For a fraction of a second there was an intense flash from the bomb, the radiated heat from which seerched objects flercely and to great distances. Among the resulting effects were the roughening of polished granite and other stones, the raising of bubbles on roof tiles, the red-dening of concrete, the darkening of asphalt road surfaces which retained the shadows' of passers-by at the instant of the explosion, and the scoreling of painted and unpainted timbers, of fabrics, and of the human skiu. Pregnant women who survived within 1000 yards of the centre of damage had miscarriages; those who survived up to 11 m. from the centre had survived up to 1t in. From the centre had miscarriages or premature infants who soon died. Even substantial buildings were penetrated by the gamma rays from the explosion and gave no protection. The ray had the effect of passing through the skin without seeming at its; to affect it. It is thought that the gamma rays caused the death of nearly everyone who was fully exposed to them up to a distance of half a m. from the centre of danger. Pople who were directly under the explosion in the open had their exposed skin burnt so severely that it was immediately churred dark brown or black: those people died within mms. or at most Both in H. and in Nagasaki, burns on exposed skin wore very severe up to about 1500 yds, from the centre of damage. Buildings and walls gave complete protection from flashbura. There was strong evidence that heat radiation was a cause of hires in unscreened buildings, probably up to a distance of a m. from the centre of damage. A number of the centre of damage A number of reinforced concrete buildings with shuttered windows escaped fire, apparently because the heat radiation, travelling at the speed of light, arrived and died away the speed of light, arrived and died away before the blast, travelling only at a few thousand ft. a see. blew out the shutters to expose the interior. See The Lifted of the Atomic Bombs at Himoshima and Nagasaki: Report of the British Mission to Japan, H.M.S. O., 1946, and J. Hershey, Hiroshima, 1946. By 1948 H. was to some extent rebuilt. Plans exist, on paper, for making the city a permanent centre of culture and peace. There are to be wide roads, pages and tree-lined boulevarts: making the city a permanent centre of culture and peace. There are to be wide roads, parks and tree-lined boulevards; hotels in the W. style are to be built for foreign tourists, and it is hoped also to build a casino on one of the nearby is. Whether these schemes will ever come to anything is in some doubt, for there is a great lack of building materials and there are virtually no funds, and up to late 1945 the Jap. Gov. had granted only 60 million yen for the work of reconstruction. The

immediate tasks then were road repairing, waterworks construction, and school rebuilding.

Hirozhige (Ando Tokitaro) (1797–1858). ap. landscape painter. True name Jap. landscape painter. True name Ando Tokitaro, he adopted the name of H. conformably to convention in recognition of his being a pupil of Toyohiro. H. was one of the chief members of the Uktoyo-ye or Popular School of Painting in Japan or Popular School of Painting in Japan (see also Hokusai) a school which was especially occupied in making colour prints. H. and his pupils (two of whom adopted the name of H.) applied the process of colour block printing for land-scapes with a skill and harmony of effect that have only been equalled in Japan by Hokusai and certainly by no W. artist. Most of the subjects of H. and his pupils were taken from the vicinity of Yedo or were scenes on the old highway between Tokaido and Kioto.

Hirpine, one of the hardy tribes be-longing to the country of Sammium, E. of Naples, Italy. In 4 s.c. they joined the Samnite alliance; their chief tn. was

and foundries; basket making is carried
on. Here on Sept. 2-3, 1911, the VII
Corps of Gen. Hodges's First Amer. Army crossed the Belgian border in a rapid ad-

wance of 40 m. in 2 days. Pop. 10,100. Hirtius, Aulus (c. 90-43 s.c.), Rom. historian, was a friend of Cicero and Casur, and the reputed author of the eighth book of the Gallic wars. The narratives of both the Alexandrian and Sp. campaigns are also usually attributed to him. The colleague of Pansa in the consulate of 13, he was slain in the battle of Mutina, though it was Antony his enoug, who met defeat.

His Majesty's Theatre, Haymarket, was designed originally by Sir John Vanbrugh, and was opened as 'the Queen's in 1705. In 1789 it was burnt down, and a second theatre erected which lasted from a second theatre erected which lasted from 1791 to 1867, when it, too, was utterly large and its varieties; bone or osseous ing, which became known as the 'Italian Opera House,' that Madame Hachel appeared in 1841, and here Jenny Lind made her debut. The third theatre dates from 1872 to 1892. It was put to various irevival meetings, and it was also the scene of promenade concerts, Wagner's operas performed by the Carl Rosa Com-

pany, and Fr. plays with Sarah Bernhardt in the cast. Coquelin aint here played Cyrano de Bergerac in Rostand's play of that name. The fourth theatre was opened in 1897 with Sir Herbert Beerbohm Tree as proprietor and manager. Under his direction many representations of Shakespeare's plays were staged; while excellent performances of other dramatic works were given, including Stephen Phillips, Herod and Ulysses, and the Japanese play, The Darling of the liods. Joseph and His Brethren appeared in 1913, David Copperfield, and Shaw's Pygmalion with Mrs. Patrick Campbell and Tree, in 1914. The most remarkable run was made both during and after the run was made both during and after the 1914-18 war by Chu-Chin-Chow (1916-1921), with Lily Brayton and Oscar Asche In the leading parts Other Eastern plays, such as Cairo, East of Suez, and Hassan, each ran for nearly a year. Beau Ceste and Mozart with Sacha Guitry and Yvonno Printemps as leading performers, were notable theatrical events of 1929. Another long theatrical run was recorded by Noel Coward's operette Bitter Sweet, 1929-1931. Later successes are The Good Com-panions (1931); Conversation Fiece (1934), with Yvonne Printemps; Balalaika (1937), the Lilac Domino (1944) and Brigadoon (1919).

Hispaniola, see HAITI.

Sandy the the most neft, but in rainy years profor the most part, but in rainy years produces good crops of barley, rice, etc. chuning and cotton-weaving are carried on in Hansi and Sisra, besides H. Founded n 1356 by the Emperor Feroz Shah. Pop (dist.) 820,000 (tn.) 25,000.

Hissar, Aflorim Kara, see AFIUM KARA HISSAR.

Histology, that branch of microscopic anatomy which deals with the intimate structure of the textures. A differentiation of functions in the higher animals has led to the development of a large number or organs, each composed of various tis-ques and textures. The result of minute dissociations and microscopic analyses proves that the actual number of elementary tissues, which are distinct in origin and structure, is small, though transition forms are encountered. The general forms are encountered. The general enumeration is as follows: epithelium, or epithelial tissue; connective tissue (many varieties, including adipose tissue); carti-lage and its varieties; bone or osseous

Examples of these are: blood | and lymphatic vessels; lymphatic and secreting glands; serous, synovial, and mucous membranes; and interument— all of which are described in detail elsewhere.

Histon, vil. in Cambridgeshire, England, 4 m. from Cambridge. Noted for jam making. Pop. 1600.

Historical Manuscripts Commission, The, Historical Manuscripts Commission, The, royal commission which began to sit in 1809. Sir Thomas Duffus Hardy (1804–1878) was influential in obtaining its appointment, as he felt keenly the desirability of some systematic investigation into the collections of valuable MSS, which at present are dispersed up and down the country in the libraries of colleges, corporations, and private Individuals. Under the auspices of this commission many records and appendices colleges, corporations, and private nun-ridusis. Under the auspices of this con-mission many records and appendices have been issued, twelve of which deal with the sixteenth-century MSS. in the possession of Lord Salisbury at Hatfield House. This research is valuable in giving to students what, would otherwise lie hidden for all time or, as has often happened, find a foreign purchaser. Similar bodies have been founded abroad since the appointment of the H.M.C.

Complementary to the work of this Commission is that of the Brit. Records Association, which is especially concerned with the principles to be followed in deciding whether to keep or destroy modern records. A very large proportion of the historical documents preserved in this country are or have been records or archives, i.e., documents accumulated in the course of organised business, social activity, or domestic affairs, by a natural process of growth, or in other words not consciously collected, and it is this natural process of growth that gives such docu-ments their value as evidence of contem-porary facts. It is said that survivals of accumulations of this kind are more numerous in England than in any other country. Such are, e.g., co. sessions record, and the like. It is obvious that through ignorance there is some danger of the destruction or disacasions persal of these records or archives, a danger supplemented by their increasing value in the sale room. The generally accepted classification of Eng. archives divides them into public, central and local; semi-public; private; and eccles. The control of these archives has, however, never been centralised in England as it has in most of the greater European countries. The Public Record Office brought together, or arranged to bring together, under one authority the archives of nearly all divs. and depts, of central gov.; but it estab, no relation between this authority and the local, private and this authority and the local, private and eccles, custodians or owners. Nor, generally speaking, has any Act estab, any inter-relations between these other authorities and individuals. The State has in fact intervened sporadically in regard to all the above classified externite of The present Royal Commission on Historical Monuments was set up in 1908 and has been at work ever since; but in its first report (1910) it directed attention to the necessity for an executive authority, and this was set up by logislation in 1913 in the shape of an inspectorate forming part of the Office of Works. See Proceedings of the British Records Association.

Historiographer, writer of history. The title has sometimes been given as a mark of honour by European courts to various learned historians. Thus Racine was H. to Louis XV. Voltaire to Louis XV. The post of King's H. in Scotland was revived in the eighteenth century and still

exists.

History, term briefly defined as the story of the past. The meaning of the Gk. word igroun, from which it is derived, is that which we come to know as the result of an enquiry.' H is not therefore to be limited to a simple record of what is known or believed to have occurred. H, is more properly concerned to examine, analyse, and explain past events, parti-cularly in human affairs, and in the words of R. G. Collingwood 'to tell man what man is by telling him what man has done.'
The oral traditions of primitive peoples which are obscured by mists of legend and of miracle are not so much H. as the sources of H. The written records of more advanced peoples may similarly be but the materials of H. The anot. Egyptians, the Assyrians, and the Chinese possessed catensive records, but they were not er analysed or explained or assimilated into u connected narrative; records they remain. connected narrative; records they remain, it is with the Gks, of the fifth contury n.c. that H. begins. They developed a reasoned approach to the past, combined with an ability to analyse the causes, examine the effects, and from the result build up an account of past events. Herodotus gave his work the title of 'a histfuy,' meaning an investigation or enquiry. It is the use of this word and its insulation to the literature of the words. tion or enquiry. It is the use of this word and its implications that makes Herodotus the father of H. He not only recounted the conflict between Greece and Persia but set out his interpretation of that conflict as a struggle between oriental autocracy and hellenistic constitutionalism. Similarly, Thucydides in his history of the Pelopon-nesian war not only described the course of the war but gave an account of the underlying causes.

lying causes.

Since therefore H. is concerned to analyse and explain as well as to describe the events of the past, it is impossible for it not to be coloured by the personality and mind of the historian. Again, only the carliest historians could attempt to record and discuss all the events of which they had knowledge. A later historian must necessarily select those events which he regards as memorable, and the selection which he makes must be a matter of personal judgment. The most clear-sighted historian will make allowance for his personal projudices in thes and individuals. The state has in the most clear-signed instorian with make fact intervened sporadically in regard to allowance for his personal projudices in all the above classified categories of archives, but such intervention in other the first to admit that H. cannot be ensents, has been wider and more definite. Values which the historian applies to his

study of the past is determined by the general social, philosophical, religious, and economic ideas of his age, either because he is in accord with the predominant thought of his time or because he is in revolt against it. Thus, the history of the Jewish people in the books of the O.T. became primarily an account of the way of God with the world, while to the Marxist historian the stery of the growth of human thought and behaviour is primarily the story of the influence and effect upon man of his economic environment. H. needs to be, as indeed it is, re-written from time to time and past events revalued in the light of fresh developments and new ideas. In addition, advances in other branches of knowledge bring to the historian new means of discovering the facts of the past and suggest to him new methods of handling his sources. The modern historian of anct. Britain has, for instance, been assisted in his knowledge of his subject by the field-work of the archaeologists and, more recently still, by the development of acrial photography, radiography, and pollen-analysis which have brought to light new facts about anct. settlements. In the nincteenth century the progress of the physical sciences and the development of the scientific method prompted the instorian to use new and more critical methods of handling and classifying his in rial. Lastly, mention may be made of the influence on the historian of the general educational and social standards of the civilication in which he lives. He is influenced in the writes. In a society in which all classes are literate, the historian is likely to be influenced in the presentation of his material by the wide range of his potontial readers.

For the modern European world the Gk. and Rom. historians stand as the great originals. Herodotus and Thueydides, Livy and Tacitus regated H. as both a science and an art. In writing down the results of their studies they accepted literary and artistic standards, but they were at pains to collect the facts and submit them to analysis. To the Gks. in particular H. had a definite value in that it led to the formation of right opinion which in their view was as necessary for the conduct of life as scientific knowledge. At the same time they did not develop in their historical thinking any conception of an ultimate goal of human society. They were conscious of continual change in human life but not of any agelong tradition moulding it.

of continual change in human life but not of any agelong tradition moulding it. The theory of H. which they doveloped was consequently one of recurring cycles. With the rise of Christianity as the dominating theory of life the theory of H. and the writing of it changed. By the fifth century A.D. the W. Empire was oversun by the barbarlans, and Rome itself had been sacked. Much of pagan literature and learning was lost, and what was still known was regarded with hostility. Human history came to be seen as a series of events essentially condi-

tioned by divine intervention and revelation which could ultimately guide mankind to a definite and desirable goal. This interpretation of H, was first outlined in St. Augustino's City of God, and from the lifth to the lifteenth century it continued to be generally accepted. It gave a unity to H, since it presented all significant events as the effect of a single cause—the Will of God. Since the city of God' would ultimately friumph and might mdeed come suddenly upon the world, what happened to the world meanwhile was of minor importance. Mainly because so few others were literate, monks were the chief (though not the only) historians of the Dark and Early Middle Ages, and the bulk of their works consisted of chronological notes (e.g. the Anglo-Saron Chronicle, and the works of the Venerable Bede and Matthew Paris) while o few educated observers like Floissart left descriptions of local contemporaty events.

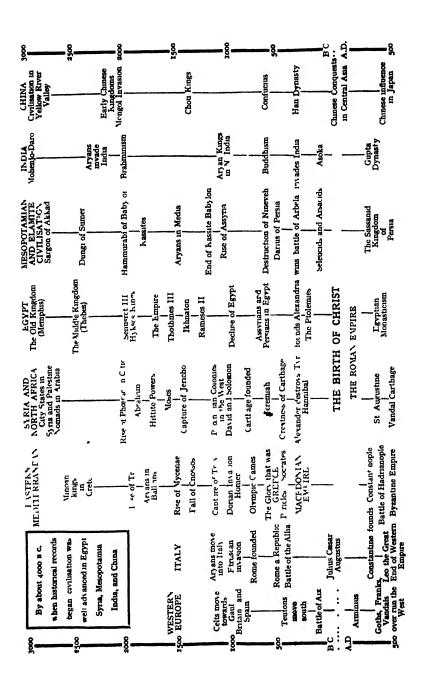

ary events.
With the Renaissance there was a return to the humanistic view of H. based on that of the ancts. Again it became a function of the historian to study and interpret human actions and human thought. H. after the Greeco-Rom. model again became concerned with material values and with instruction in the art of politics and practical life. Machiavelli set hunself to understand human actions, to study political history, and to explain to the Its, why things had happened as they did. From Italy the new approach to learning spread to other countries. It, historians, often at the invitation of the rulers of the new nationalist states states which were in part the result of the revival of the later Rom, conception of revival of the later Rom, conception of sovereignty (absolute military monarchy or 'Casarianism'—Monnusen)—introduced the new idea of H. to European courts. Polydore Vergii of Urbano was commissioned by Henry VII. to write the history of England, a task which was completed in 1533 and presented to Honry VIII. At the same time, the discovery of America and the formulation of the of America and the formulation of the basic principles of experimental scientific method played a part in encouraging an interest in H. While less and less could be taken for granted in a world which had telt the impact of the new discoveries, the beaunings of science suggested new criti-cal methods of approaching the past. Thus Wm. Camden in his work on the topography and archeology of Britain re-constructed the past from data in much the same manner as the natural scientists of the time were using data as the basis of

their scientific theories.

The reaction away from the medieval view of the nature and history of man was virtually complete in the eighteenth century.

Humo and Voltaire established the belief that human life had been in the main a matter of blind and irrational forces but

yet was capable of being converted into by the growing importance of H. as a something rational. To them the Middle subject of univ. study, and the historical Ages were a period of barbarism. They consequently had little interest in any but professional or 'professorial' historians the modern period and for this many but professional or 'professorial' historians the modern period and for this reason did ittle to improve the methods of historical research. Hume's *History of England* is slight and sketchy in its account of any period earlier than the Tudors, and Voltaire expressed the view that there was no reliable historical knowledge of events wallow than the sixtorith century. carlier than the sixteenth century. To (libbon also the motive force of H. lay in human irrationality, and in The Decline and Fallof the Roman Empire he wrote the story of what he himself described as the triumph of religion and barbarism. In the latter half of the eighteenth century, however, greater emphasis was laid upon the idea that mankind was capable of a rational life, and a more scientific study was made of the advance of H. from barbarism towards reason and enlightcument. Turgot drew a distinction between natural phenomena, which remain the same for ever, and human society, where knowledge is acquired and experience transmitted. In this view the H. of mankind, despite periods of disturbance, is one of continual advancement. Condurcet also set out to show 'the successive changes in human society, the influence which each instant exerts on the succeeding instant, and thus in the successive modifications, the advance of the human species towards truth

and happiness.'
The Fr. Revolution broke rudely upon the idea of progress. As a reaction from the excesses of the Revolution a new interest was taken in the Middle Ages; there was a sense of glamour in far-off times by contrast with the doubt and disturbance of the present. This historical interest was linked with the Romantic movement in literature in which it found its chief expression. It showed itself in historical scholarship, however, mainly in the work of the Ger. historians of the time, among them Momrusen, men who lirst directed their attention to the study of classical texts and anct. inscriptions but classical texts and anct inscriptions but later extended their range to include the Middle Ages. In Germany the impulse to study medieval H. came from outside academic circles and was due in part to political motives: the medieval empire had been the archetype of Ger. unity and what Germany had once achieved she might, it was argued, achieve again. The critical methods of the Ger. historians in the examination and analysis of their sources and the solid basis of their scholarship had a great influence on the work of historians in other countries. In England up to the middle of the eighteenth century H. had been mainly regarded as a specialised branch of literature, and the greatest names of that time, for instance Macaulay and Carlyle, were those of men who were writers and men of affairs as much as they writers and men or amints as much as they were historians. By the eighteen-seventies, however, Eng. historians were following the method adopted by the Gers. and were becoming increasingly adentific in their assessment of historical evidence. This tendency was furthered

writers of the time were more akin to the professional or 'professorial' historians of the twentieth century than to their predecessors. Stubbs, for instance wrote for scholars and students, and Mathand's work on the history of law and institutions in kingland, despite the brilliance and lucidity of his style, is mainly a technical study which is not always easy for the layman to follow. At this period a number of societies were founded for the editing and pub. of anct. legal and the editing and pub. of anct. legal and historical documents. In 1887 Maltland founded the Selden Society for the pub. of anct. legal records and himself ed. sey. of its pubs. As the sources of H. came to be more and more explored and knowledge was amassed, research tended to concen-trate on various detailed aspects with the trate on various detailed aspects with the background of which only the expert could be familiar. H. was in fact in danger of becoming a purely technical subject, and the wider function of the historian in interpreting the past to the present tended to be forgotten. Already, however, a note of revolt against the conception of H. as being concerned only with politics and constitutions had been sounded by Carlylo: 'the thing I want to see,' he wrote, 'is not Red-Book lists and Court Calendars and Parliamentary Regiswhat men did, thought, suffered, enjoyed
... The very title of John Richard
Green's Short History of the English
People is, again, indicative of a wider,
more human approach to H. His work was the result of an awakening social con-science. Arnold Toynbee's Lectures on the Industrial Revolution reflect a similar impulse and were written under the in-fluence of a new and wider conception of social justice. The induces of Karl of social justice. The influence of Marx tended is the same direction. To Marx, H. was basically a story of the struggle between social classes created by the methods of production in use at any given time. In his view the economic structure of society is the real basis on which rested the legal and political superstructure. Relatively few historians have accepted the Marxian thesis that economic history is the clue to all H., but the influence of Marx stimulated an interest in the economic and social approach to H.

In recent years historians, while shed-ding nothing of the tradition of sound scholarship and careful research inherited from the later nineteenth century, have combined these qualities with a deter-mination to examine the wider aspects of H. Among many modern scholars, Prof. G. M. Trevelyan may be quoted as one who holds the view that H. is both a science and an art, that while the discovery of historical facts should be scientific in method the exposition of them for the reader should partake of the nature of art, 'the art of written words, commonly called literature.' Try relyan too is among those who have embodied their learning in general works of interest to the nonspecialist reader as well as to the specialist. H. becomes an aid in the philosophical interpretation of human life, and in this connection mention must be made and in of the great comparative study of civil-isations which has been undertaken by Prof. Arnold Toynbee in his Study of History.

Here has associations with famous men. Here at Church House, once a school, Eugene Aram was a master. George Chapman dramatist, poet, and translator of Homer was born at Tilchouse Street. In the Baptist ('hurch in the same street is a Baptist Church in the same street is a chair John Bunyan gave the minister in his day. Sir Henry Hawkins (late Lord Brampton), who as a criminal judge has had few equals, was born at The Grange in 1817. Sir Henry Bessemer, inventor of the steel process which bears his name, was born in 1813 at Charlton nearby. Pop. 14,000. See R. Hine, The History of Hillehin, 1927-29, and Hitchin Worthics, 1920. 1932.

Hitler, Adolf (1889–1945), Ger. dictator, b. at Braunau-am-Inn, Austria, his parents being of Bavarian and, perhaps, Bohemian, peasant origin. His father was a Customs officer in the Austrian service, who till late in life was known as Schicklgruber

Hausname and a Schreibname and the change from one to the other is evidence of the sale or cession of property rights to a new owner) and who married three times, Adolf being the only son of his third wife. Adolf went to the best school available and was intended for the civil service, but the boy was interested only in drawing and architecture. His father dying, however, in 1902, left no resources for Adolf's continued education, and for the continued and the continued by the continued of the continued by the continued of the continued by the continued of the some years he lived a life of hardship.

E.N.A.

ADOLF HITLER

With his mother he went to Vienna hoping to become an architect, but had to earn his living as assistant to a house-painter and by selling indifferent sketches. After few years' miscrable existence in Vienna he left in 1912 to settle in Munich. These years of penury and even mendicancy were formative of both his philosophy of hie and of his character. Vague Nordic open a mingled in his mind with ideas of the clevating influence of war and with less mational dreams of Ger. national unity; and in the attempt, later, to realise these dreams he proved himself the successor of Bismarck. He completed Bismarck's work because, having himself a singularly forceful and sensitive personality, he was exposed to and responded to all the influences that were moulding Germany's character and destinios in the first three decades of this century. In the particular of this extreme observation between (Austrian peasants have two names, a period of his extreme obscurity between

1904-12 he imbibed the pan-Germanism |

1904-12 he imbibed the pan-Germanism of Georg von Schoenerer, who indeed inspired H.'s strange views in Mein Kampf, and he studied the tenets of Karl Marx and Engels only to reject them. Even thus early he conceived a violent antipathy to the Slav influence in the Dual Monarchy and an equally violent anti-Semitism.

When the First World War opened he first volunteered for service with the Austrian forces but was rejected for physical unfitness. He then joined a Bavarian reserve regiment. He fought in the trenches, acted as despatch rider, reached the rank of gefreiter or lance-corporal, won the Iron Cross, was wounded in the Somme Battle, 1918, and was badly gassed in 1918. He lay blinded and helpless in hospital through the months of the revolution and the Armistice. It would have needed a man of much greater equipoise not to be carried away by the legend of Germany's 'stab in the back,' and he convinced himself that Germany had been defeated through the treacherous and enfeebling influence of the Marxist socialists. Back in Bayaria while attendand enfeebling influence of the Marxist socialists. Back in Bavaria while attending and, later, conducting, courses designed to keep ex-servicemen away from Bolshevism, he came under the influence of Gottfried Feder, the intellectual father of the Nazi movement. It was at this time that he began his political career. He became the seventh member of an insignificant political group in Munich, the 'Germau Workers' Party,' and, equipped with a few definite ideas and a equipped with a few definite ideas and a clear insight into the value of the arts of propaganda, he soon distinguished himself by his gift of popular oratory. Through his friends, Capt. Roehm, a staff officer of Munich, and Gen. von Epp, he maintained close contacts with the Recchsmanusined close contacts with the learns, webs, which were to stand him in good stead. In 1921 he ousted Droxler, the founder, and himself became leader of the party, which now styled itself the National Socialist German Workers' Party, its programme being H 's nationalist and anti-Marxist creed. Differing from Rochm as to the function of the newly-created Sturm Abbellung troops (Brownshirts') H. organised a special detachment to be his own political execustaffel (S.S.) or Blackshirts formally estab. in 1926 in imitation of Mussolini's organization Through Roehin H secured the tact approval of the local high command, togother with financial resources. sample (1.5.5.) or Discission of Mussolini's organization Through Roehin H secured the tacit approval of the local high command, togother with financial resources. Thus encouraged he made his first attempt, in alliance with Roehin, Ludendorff and Goering, to selve power, in the notorious mitsch in Munich of Nov. 9. the challenge and again dissolved the 1923, the intention being to make Ludendorff Dictator. Two days later he was arrested and with others, including Ludendorff, tried for treason. The Reichswehr intervened behind the scenes Schleicher, who was also manocuvring for to stifle the military connection with the reactionaries, but H. was sentenced to five years' imprisonment and incarcerated in the fortress of Landsberg im Lech. Here he worked on the final draft of Mein Rampf (g.v.) with the aid of his friend Rampf (g.v.) with the sid of his friend Rampf (g.v.) with the sid of his friend Rampf (g.v.) with the aid of his friend Rampf (g.v.) with the sid of his friend Rampf (g.v.) with

who has not read this strange rambling one-thousand page autobiography, philone-thousand page autobiography, philosophy and programme, with its prolixity and hombast, its candour, its peasant shrewdness, its fanaticism. Meanwhile his party disintegrated. Released under an amnesty in 1925 he set to work immediately to rebuild the party organization, though for some time Strasser, creator of the Nazi party in N. Germany, was more influential than H. in the party ranks, whose strength in the Reichstag was only twelve. H., however, gradually recovered the ground he had lost since the abortive pulsch. By 1930 he was the undisputed head of a considerable party. Funds were increasingly flowing in from Funds were increasingly flowing in from the big industrialists, who saw in National Socialism (q.v.) their best safeguard against Communism. 'Nationalism' gradually superseded 'Socialism' in the party programme, though its language was

when the world economic crisis came in 1930 H.'s party exploited the disillusioned and discontented masses as well illusioned and discontented masses as well indeed as the more solid elements, who saw their standard of living threatened by the crisis: and in the next election, after Brining (q.r.) had dissolved the recalcitrant Reichstag, H.'s party won 107 seats. Shortly after this he stood against you Hindenburg in the presidential election and in the first ballot he barely suggested in pregretaling respectively. succeeded in preventing von Hindenburg from securing the necessary absolute majority. Beaten in the second ballot H. majorby. Braten in the second ballot Hawas, nevertheless, now a political power to be reckoned with. In a rapidly deterior-ting political situation Chancellor Bruning felt compelled to govern by decree and, though liberal in outlook, his regime paved the way to dictatorship. But in May 1932, he fell, after securing the re-election of you Hundenburg as president and dissolving. H.'s. Brown Army. But though H regarded himself as heir to the chancellorship, he was now baulked by the covert resistance of the old Right wing the covert resistance of the old Hight wing rigine, with its backing of industrialists and Junkers. When you Papen became Chancellor, H. remain d aloof. You Papen dissolved the Reichstag but the Nazi party doubled its strength and they and the Communists seemed to be sweep-ing the country. H. was now at the head of the biggest single party. When, how-

Thus in January, 1933, began the period of the Third Reich. By the end of that year the one-man Party had become the one-Party State. In the elections it was only by the support of the other Right parties that the Nazis had won a majority vote. Terrorism and brutality, however, eath. H. in an unassallable position. parties that the vote. The rorism and brutality, nowever, estab. H. In an unassallable position. Opponents disappeared by assassination or into concentration camps (see Buchev-wald). The conservatives were should be also be a state enough the was astute enough. WALD). The conservatives were should-ered aside, though H. was astute enough not to offend any powerful interest. When some of his followers, wearled of Socialistsome of his followers, wearled of Socialist-and Jow-baiting, murmured against the dropping of the 'Socialist' and Radicai elements of the Party programme, II. suddenly struck down any and all of the leaders, Nazis or reactionaries, likely to give trouble, the chief victims being Strasser, Rochm, and Schleicher and his wife. This was the infamous 'purge' of June 30, 1934, in which a hundred National Socialists were murdered. All power now passed to the National Socialist executive, which, for all practical burexecutive, which, for all practical purposes, meant H. himself. The true reason for this purge may never be precisely known, but it is generally believed that Roohm aimed at getting the Reichswehr embodied in his Sturm Abbeilung organization, which H of course resisted Soon afterwards Hindenburg died and H. was declared his successor; but he abjured the time of Reichspräsident in favour of Fuehrer and Kanzler. Thus the mendicant adventurer of Munich now

became the master of Germany. Sure of his position in Germany by ruthless terrorism. II now began his long campaign to re-tore Ger. power in Europe, heralding his advent to power by a series of increasingly grave breaches of treaty obligations and by flouting European opinion. The first need was to rearm Germany which was done secretly at first Germany which was done secretly at Inst. and then ever more flagrantly. But before launching his attack on the Verseilles Treaty he awaited the plebiscite on the Saar in Ian 1935. The result, partly influenced by terrorism, was an overwhelming majority for retrocession to Germany. In March he denounced the military clauses of the Treaty and Intro. definity. In Maior is accounted with a military clauses of the Treaty and introduced conscription for the Reichswehr A year later he boldly risked marching his forces into the demilitarised Rhineland zone, at the same time denouncing the treaty of Locarno (q.v.), which, he claimed, had been abrogated by the Franco-Soviet Alliance. This, coupled with conscrip-tion, transformed the military situation, for at one blow it deprived the W. Powers Alliance. This, coupled with conscription, transformed the military situation, for at one blow it deprived the W. Powers of their strongest weapon, freedom of entry into Germany. Thenceforward II. could hope to resist an attack on his W. front with one arm while the other was free to threaten the E. In July, when the civil war in Spain broke out, II. seized the opportunity to test his army and air force on the side of Franco. And once again the democracies hold off and weakened, while Germany waxed in strength and II. in defiant confidence, comformably with dootrines contemptuously expounded in Mein Kampf. H. now pursued his tech-

nique of deliberately lying so as to luli future victims into a sense of false security while hatching his aggressive schemes. Yet in all candour he himself had averred that the bigger the lie the better the chance of its being believed. The remilitarisation of the Rhineland was followed by two years of the most active Ger. military preparations coupled with an economic reorientation aiming at autarky. Events abroad in 1936-37, such as the League's ignominious fallure to check Mussolini's Abyssinian adventure, increased the nervous tension in Europe, and went far to strengthen H.'s position. Mussolini was drawn into the orbit of H.'s machinations and intrigues, and their collaboration found expression, in Sept. 1937, in the Rome-Berlin Avis (see Axis) a diplomatic coup whereby H. gained an while hatching his aggressive schemes. a diplomatic coup whereby H. gained an allv at the expense of the Powers of the Versalles *Piktat* whose moral influence had well nigh vanished in a weiter of appeasement.
The end of 1937 saw Germany's course

set for an expansionist foreign policy which for two years won spectacular successes. Austria was seized without a successes. Austria was seized without a fight, a country which even Bismarck had shrunk from touching. H. had acquired Austria by the simple process of manipulating an abrupt crisis in Austro-Ger. relations and then sending the Ger. army across the frontier and forcibly incorporating Austria in the Reich. Mussolini despite his apprehensions was too covered to make a counterecting move owed to make a counteracting move.
But the great test of this policy came with
the campaign for the liberation of the
Sudetenland; for this was an attack on
a sovereign State bound by Treaty with
the W. Powers and by ethnic ties with Russia (see further under CZECHOSLO-VAKIA). But H. had gauged to a nicety the underlying realities of the immediate political situation. Enough for him that the cove, in the W. were not then prepared to fight. Then followed the humillating part of Munich (q.r.) and H. now seemed pact of Munich (q.r.) and H. now seemed in the eyes of the average Ger., not only to be the preserver of peace but a consummate statesman, outrivalling all his predecessors in extending the Reich frontiers. As doubt each successive seizure enhanced the feeling of resentment in the W. as much as it enhanced H's prestige in the Reich. Yet his occupation of Prague was his first had blunder owing to its effect on Bitt. foreign policy and on Mr. Chamberlum. It in fact led to the Brit. guarantee to Poland and all that that was to inuly to Poland and all that that was to imply

expansion S.-E. and made himself the In his New Year address in 1940 he demost powerful dictator in Europe since clared that he was fighting for a 'New Napoleon I. In the talks with Mr. Order' (q.r.) in Europe, and in March he Chamberlain at Berchtesgaden and Godesberg he had reiterated his stock phrase to the invasion of Norway and Denmark used after the rape of Austria—that he and the overrunning of the Low Countries had no more territorial claims to make. Yet soon afterwards he was invading and overrunning, not merely the Ger. in-habited regions of Bohemia, but the whole of Czechoslovakia, and then himself went to Prague to proclaim yet another blood-less victory, while at the same time he announced his annexation of Memel in violation of the Versailles Treaty. Poland was the next victim marked out

for H's hatred and aggression. He was now claiming the retrocession of Danzig and demanding the Polish corridor (q.r.) and in response to Poland's appeal, Britain and France at once guaranteed Polish independence. II. was shaken by this development, more particularly when the two W. Powers began negotiations with Moscow. For if he now proclipitated with Moscow. For if he now procipitated war it would be to rouse the haunting spectre of a war on two fronts. But rather than abandon his cherished designs on Danzig and the corridor he preferred to swallow all that he had previously said in condemnation of the Bolshevist regime and proposed the non-aggression pact with Russia to which Stalin agreed on August 23. With the removal of any probability of Soviet assistance to the W. Powers the way was clear for H.'s blitchrieg on Poland. He went himself to superintend the slaughter and strutted among the ruins of Warsaw,

which were destooned for the occasion.

The first weeks of the Second World War, involving the callous conquest of Poland, illustrated H.'s cynical fiction of a defensive war against 'encirclement' or, in his own phrase, a state of neither or, in his own pirrase, a state of neither war nor peace, a convenient fiction which left him with the initiative both on the battlefield and in the sphere of diplomacy. Had they but taken literally the crude assumptions in Mein Kampf his cuonies would sooner have understood the full implications of his methods, his policy of attack from within or of corrupting a nation from within and of repeating the process with one nation after another, while his opponents continued to rely on the false security of an outmoded diplomacy. After the immolation of Poland, H., speaking in the Reichstag on Oct. 6, in a remarkable rhetorical outburst, made his lest offer to the Albert Duty of the Albert of the A lest offer to the Allies. But as a pica for peace it suffered from the new univer-sal realization that his word could in no circum tances be trusted. A month later be spoke at Munich in the Burgerbrau beer he spoke at Munich in the Burgerbräu heer cellar on the anniversary of the 1923 pulseh, announcing that he had ordered Goering to prepare for a five years' war. He left the beer cellar somewhat abruptly and soon afterwards there was an explosion in which a number of persons were killed. Though it was averred by Ger. propagandists that the attempt was engineered by foreign agents, it was generally believed that H. had departed early in the knowledge that it would occur. early in the knowledge that it would occur.

and France.

The disastrous events of spring and summer, 1940, culminating in the disgraceful armistice with Pétain (q.v.) only confirmed the average Ger. belief in H.'s genius. Following these conquests the natural littleness of H. revenlingly asserted liself in the resurrection of the armistice coach of Complègne of 1918 for the armistice of 1940. But although the Hitzkrien had won remarkable successes it had krien had won remarkable successes it had fulled, owing to the obtuseness of the incomprehensible Brit.. to bring victory. After the Battle of Britain (n,r.) had been in progress for some time H. hegan to realise that Britain could not be conquered from the air and, having met Vinssolini at the Brenner and again in Florence to concert furfier measures against her had learnet Februs, in Speak. against her, he also met France, in Spain, probably with the object of inducing him to co-operate in the blockade of Britain. H.'s thoughts, indeed, turned increasingly on U-boat warfare. In his New Year's proclamation to the Reichswehr in 1941, proclamation to the receivement in 1941, he promised victory over Britain that year and the destruction of every nation which 'ate of democracy.' He continued to repose confidence in submarine warfaro and sought to fix on Mr. Churchill's shoulders the responsibility for unrestricted or indiscriminate bombing. In the arring of 1941 he attacked Vurselayle the spring of 1941 he attacked Yugoslavia and Greece and went to join his advancing armies there, while continuing to belabour Britain with his bombers and striking under water at her seaborne supplies. H knew that only successful invasion could bring Britain to her knees. But both II. bring Britain to her known. In the and his military experts feared to make the effort, and as an alternative II. in 1941 planned to attack the empire at its Achilles-heel in the Middle E. This plan, 1941 planned to attack the empire at its Achilles-heel in the Middle E. This plan, however, depended for its success on the neutrality of Russia and, not being sure of this, H. and his advisers decided to combine the attack on Egypt with an invasion of Russia itself. Just previously (June 3, 1941) he again met Mussidini at the Brenner, ostensibly to set in motion a European peace. Three weeks later he doffed the mask and, breathing anathema on the Soviet gov. as the 'Jewish-Bolshevist clique,' launched breathing anathenia on the Soviet gov. as the 'Jewish-Belshevist clique,' launched his legions against the hated Slavs of Russia.—a piece of bluff and treachery which he had revelved for many years, having in fact imparted his scheme to Dr. Rauschnig in 1934. This fatal decision revealed the essential weakness underlying all H.'s pellpotitik, and it is probable that he took it against the opposition of other Nazi leaders and against the advice of many members of the Ger. General Staff. But in June 1941 he had taken the plunge for good or ill. Thenerforward he strove to divide Russia from the W. Allies by harping eternally on Germany's anti-Bolhovik crusade (see also Anti-Comintern Pact) and even also ANTI-COMINTERN PACT) and even

The Ger. campaigns in the Balkans and the Mediterranean were brilliant in conception and execution but Brit. intervention in Greece and Brit. resistance in Crete and Libva delayed H.'s time-table. probably fatally, and, as the summer of 1941 were on it was becoming obvious that Ger. optimism had outrun itself. For some time H was silent, but on Oct. 4, at a meeting of the Winter Help Campaign, he announced a 'gigantic operation' which would bring about the defeat of Russia. Then a lew days later, he boasted that he had smashed her. The final desperate assault on the Caucasus falled disastrously, and at last the voice of the critics in Germany was heard. But, as always in these military crises, it was un known whether H. had imposed his will on the Ger. Goneral Staff or whether the generals, appreciating the disastrous effects of the retreat in Russia on Ger military and civilian morale, asserted therealy was content of the retreat in Russia on Ger The Ger. campaigns in the Balkans and military and cavilan morale, asserted themselves against H. But on Dec. 21 following the ominous failure of the following the ominous failure of the Reichswehr before Moscow, H. abruptly announced the dismissal of the commander-in-chief. Brauchitsch, and his own assumption of direct control of all military operations. Against further disaster he staked the legend of his own intuitive talent—a decision no doubt hastened by the entry of the United States into the war and the fact that four-fiths of the world was now ranged against Germany. For the circumstances of the Amer, intervention disposed of the of the Amer, intervention disposed of the

sent Hess to England on the amazing mission of winning over Britain to a the Volga at Stalingrad while Rommel crusade which, had it by any conceivable mischance succeeded, would have out muniched Munich. It is, of course, possible that Hess flew over on his own initiative, but this is improbable except on the extreme supposition that Hess, alone of the leading Nazis, was utterly opposed to the Russian variue and hoped somehow, to thwart it through British action.

The Ger. campaigns in the Balkaus and of Stalingrad was even more reverberating.

For, not long before, H. had exuited over
the expansion of Ger. lebensraum at the
expense of other European nations, and,
on Oct. 1 at the Sportspalast, with charteristic returning to the provided the capture of Stalingrad. His strenuous attempts to make good his pledge cost (fernany tremendous losses in life and material in a defeat which will loom large material in a defeat which will loom large in the chronicles of war for all time. From that time H. spoke less of Ger. victory than of the inability of the Allies to defeat Germany and in his New Year Order of the Day for 1943 his tone Indicated a more chastened Fuebrer. For Germany's in-dustrial potential was now being severely damaged by air attack, and the Soviet damaged by air attack, and the Soviet armies were pressing ever more massively on the E. Front. On Feb. 25, instead of speaking, H. issued another proclamation, this time to celebrate the anniversary of the Nazi Party's foundation. His silence set rumour abroad and a month later he feit bound to break his long reticence, His address, however, was a lifeless reticration of raw clicht's utbrod in a perfunctory hurried mumble.

But new crises soon faced him. In July 1943 his brother dictator, Mussolin,

July 1943 hts brother dictator. Mussolini, fell from power a few days after he had met H. to demand more help in the defence of Italy. H. tred to palliate the capitulation of Italy, which soon followed, by stressing Italian sabotage and weakness of will to fight and by claiming that he had for some time foreseen this result. I'wo months later, in Munich, at a party gathering he seemed to regain something of his old confidence. In emphatic tones he declared that the hour of retaliation had come and that everyth by was possible of the Amer. Intervention disposed of the last chance of a compromise peace even if the generals overthrew H. and sought peace as a military dictatorship. Whence the very natural desire of the generals to escape responsibility for the ultimate collapse which they knew they were powerless to avert.

It's New Year message for 1942 showed a marked decline in buoyanes. It's New Year message for 1942 showed a marked decline in buoyanes. It's need, it is all, he said, 'pray to God that the year will bring a decision'—a strange invocation in the light of the Nazi 'creed.' But there were rumours of disaffection among the Ger, generals and among the radicals in the Party, and H then appointed Bormann to secure coperation between the Party and the State. At this time he was making the greatest efforts to strengthen the home front and to augment the vast numbers of foreign slave-workers driven into the spring offensive. The Ger, armies had heen driven ont of Russia matter the Auglo-Amer. landing in Normandy to supply the Reichswehr for the spring offensive. The Ger, armies had heen driven ont of Russia at remnants of a Ger. 'opposition,' led by certain generals of the Reichswehr, H. could hope for further success in the allies still far from their total war-effort, H. could hope for further success in the sided and, in fact, in the earlier half of two elements of the Left, attempted a seven ele

coup d'état which had obviously been long prepared. The signal was to be the assassination of H., but the bomb which essessmenton or H., but the bottle which was placed in his headquarters by a staff officer named von Stauffenberg failed in its purpose. H.'s staff were all killed or wounded. H. is said to have sustained injury to an eardrum besides possibly other injuries. The fact that he had escaped death was not known to the constitutions who proceeded to execute their spirators, who proceeded to execute their plan, but with disastrous results to them-selves, for they were quickly rounded up and executed after trial before a 'People's and executed after trial before a 'People's Court.' The revolt, however, had shaken the Nazi regime to its core. On the night of July 20 H. broadcast an appeal for loyalty and discipline. When the immediate danger was past, the badlyfrightened Fuehrer instituted his last and most eavage 'purge,' thousands of men and women being shot, not because they were implicated, but because they might conceivably have led another rising. At the same time Himmler (q.n.) took command of the army inside Germany so as to tighten the Nazi grip on it. Thenceforward the Ger. people had no alternative but to follow H. to perdition. After his microphone appeal of July 20 he again relapsed into silence and obscurity. It is not improbable that he had been more not improbable that he had been more seriously affected by the bomb explosion than was revealed and that Himmler had in practice assumed the gov. of the country. This seemed to be confirmed by the proclamation on the formation of the Volkssturm: but H. continued to issue some sturm: but H. continued to issue some proclamations and once sgain, on Jan. 1, 1945, he spoke on the wireless, from E. Prussia. But as the Allies pressed into Germany from all sides H. succumbed to the pressure of great events. Obscurity shrouds his final hours. It was rumoured that he would retire with the S.S. and Nazi fanatics to some last redoubt in Bavaria and then that he had changed his mind and resolved to remain in Berlin, perhaps with the idea of creating a legend perhaps with the idea of creating a legend pernaps with the idea of creating a legend by an heroic death on the barriers as those were stormed by the triumphant forces of Marshals Zhukov and Konley. But as events proved he had no need to seek death, for death in any case was alroady at hand.

H. achieved the triumph of the Nazi party in Germany by a mixture of deceit and violence, and used the same devices to destroy other nations. From the time he became master of Germany he made lies, cruelty and terror his prin. means to accomplish his purpose; and he became in the eyes of sirtually the whole world, an incarnation of absolute evil. The neurotic, who made himself leader of the Ger. race, inflamed it with his ambitions. His monument is the devastation he wrought, his dirge the grieving of nations at the miseries he heaped on thom. Nono of those who in past centuries have sought to conquer Europe set his traps with the same cold deliberation, inveigled his prey towards them so cunningly and, when it was in the toils, struck with such ferocious and concentrated fury. None had his sorm of neonles weaker than his own nor

his ingenuity in torturing them when once within his power. His portentous power came from a combination in a single being of a soul obsessed by injured pride and hatred, a mind able to devise the means of gratifying them, and the tenacity of a remorseless purpose. His immediate aim when he entered politics was the redemagnet. when he entered politics was the redemp-tion of the Ger. people from the humilia-tion and consequences of defeat: but even tion and consequences of defeat: but even then he was looking far ahead of this goal, to a Herrenvolk to be. The Nordic theories of Gobineau and Lapouge equipped him with a philosophy which demanded helots for its fulfilment, and he found these among the Jews, Slavs and marxists whom he bout to his purposes with an impassioned hatred. He found to the divided and tortuned eater of sind the divided and tortuned eater of sind in the divided and tortured state of mind of the Ger. people the symbol and ex-pression of his own morbid emotions and interiority complex. He made it his life-work to identify himself with the Ger, people and, by inflaming their animosities and ambitions, to find an outlet for his and ambitions, to find an outlet for his own. From an intuitive understanding of the Ger. mind and psychology he elab-orated theory and practice of propaganda which, because it worked on people with obsessions similar to his own, achieved startling success; and later, with Goobbels (q.1.) he devoloped it into a new and foarful instrument of tyranny. His resourceful-ness was extraordinary, and in the art of suffing policy to necessity he had no equal. If he had cunning and ruthless coadjutors in Goering, Himmier, Goebbels and others at his side, it was H. who had appointed them and shaped their course; it was his name which rallied Germany and his character which informed every develop-ment of Nazi policy. It has been well said that if his life and statecraft be seen in true perspective it becomes plain that, though he would gladly have kept England and, later, the United States, out of the war. He was ready to risk dety-ing a world in arms if by that means alone he could estab. the Germany of his ambition.

ambition.

It is difficult in these years to achieve full objectivity in the assessment of H.'s record in mankind's story. Evil genius of Germany and indeed of mankind, he was yet also, or so hist. may decide, the one political leader of genius Germany has produced since Bismarch. One thing is certain: like Napoleon he changed the world even if he could not conquer it, and the tragedy of the war he unleashed upon an the nations induced the protoundest questionings of the moral basis of most existing political and social institutions. His tragedy and that of Germany was that his later madness undid all that had been achieved for his country in the years before moral and perhaps mental corruption set in.

at the miseries he heaped on them. None of those who in past centuries lave sought to conquer Europe set his traps with the same cold deliberation, inveigled his prey towards them so cunningly and, when it was in the toils, struck with such ferogious and concentrated fury. None had his speaking to them like a man possessed by scorn of peoples weaker than his own nor land all-consuming passion. His speeches

revealed no truly original ideas. In them he relied largely on the emotional impact wrought on his followers by constant reiteration of past hist, and deep-seated prejudices common to many Gers.; and it may truly be said that his remarkably keen and subtle comprehension of the mind of the Ger, people was at once the mainspring and the ultimate source of his power for evil. His whole life illustrates the force of Plato's aphorism: 'Those who have no natural aptitude for justice and other noble ideals, and no affinity with them, will never learn the full truth about good and evil, however good their intelligence and memory may be in other fields. fields.

intelligence and memory may be in other fields.

Hitopadesa, or 'Friendly Instruction,' free adaptation of the Fables of Bidpan (or Pilpav), which was itself a collection of old Hindu stories, derived eventually from the Pancha Tantra, or the legends and apologues of the Brahma Vishnu Sarman (second century B.C.). Though the Fables of Bidna were trans. In the sixth century

(second century B.C.). Though the Falles of Bidpen were trans. in the sixth century of Bidpan were trans, in the sixth century a.D. into Pahlavi (auct. Persian), and after wards into Arabio, Gk., Lat., and so into the tengues of modern Europe, they are best known to W. peoples by their modernised version, the H. This latter anthology, of which there are at least three Eng. trans., contains a number of loosely-interwoven animal tales, etc., which are strewn with moral apothegms and quality recounted after the manner of Anop or La Fontaine.

Hittite Language, see under Indo-European Languages, or group of

Hitties, and. people, or group of peoples, whose origin is still a matter of dispute. The Biblical names Heth and

the site of one anct. city, now known as Boghaz Keui, formerly Pteria, the anct. cap. of Cappadocia, which appears to have been occupied by the H. at a very early date. Pteria lies E. of the Halys, from which point roads radiated to harbours on the Ægean, to Northern Syria, and the plain of Cilicia. In the O.T. they are spoken of in Gen. xxiii. 10 as the children of Heth, dwelling in Kiriatharba (Hebron). In this reference Abraham appears dwell-In this reference Abraham appears dwell-In this reference Abraham appears dwelling among them as a stranger and wishing to purchase a place to bury his dead wife in. This he accomplished through Ephron the H., who sold him the cave and the fields of Machpelag. In the book of Ezeklel (xvi. 3), Jerusalem is described thus: 'The Amorite was thy father, and thy mother was a Hittite'; there are sev. other general references in the O.T. and they are also mentioned as individuals. other general references in the O.T. and they are also mentioned as individuals, e.g. Uriah the H. One reference (1 Kings x. 28, 29) mentions the kings of the H. buving horses and chariots from Egypt. This is interesting, because until the coming of the Hykses to Egypt, the horse appears practically unknown or little used, and the H. people came from a country where horses had probably been hered and appears practically unknown or little used, and the H. people came from a country where horses had probably been bred and used for a considerable time. To the Exyptians the H. were known as the Expytians the H. were known as the Expytians the H. were known as the Expytians are the Hyksos who conquered the Egyptians were the same as the Kheta, but at present it cannot be proved, but so far the extreme difficulty of correct dates makes it impossible to do more than theorize. Thothmes I. led his triumphant armies over N. Syria, and took the tn. of Kadesh, or Cedesh, the stronghold of the Kheta; this was not long after the expulsion of the Hyksos from Egypt. Thothmes III. waged terrible war against the Kheta, who were by this time evidently strong enough to be regarded as serious foes. They rose in revoit against Egypt, and Thothmes III. marched over N. Syria and reduced the tribes who had banded together with the II. to utter submission. Kadesh and Carchemish on the Euphrates fell into the lands of Thothmes, who marched back to Egypt laden with plunder and cantives. hands of Thothmes, who marched back to Egypt laden with plunder and captives: the king of Kadosh, however, escaped. In the reign of Amenhotep IV. (Akhnaton) the H. appear to have gathered great strength, and, throwing off the voke of Egypt, began to press steadily down on to the frontiers of her empire, taking fourthly one by one the tree of Swrite Medical Procedure. Hittles, anct. people, or group of peoples, whose origin is still a matter of dispute. The Biblical names Heth and Hittle indicate a people practically unknown until recent exploration, after 1870, brought to light a number of distinctive monuments. In 1880 Prof Sayce announced the discovery of a forgotten Hittle Empire once flourishing in Asia Minor. Their settlements and rule extended at various periods from Armenia to W. Asia Minor, and as far S. as Falcs that they were the White Syrians, or Syro-Cappadocians, known to Herodotus. Many monuments and tablets have been discovered in different forms of the rempire, taking forcibly one by one the tans of Syria. The forcibly one by one the tans of Syria. Kheta.' He appears to have won some victories over them, but by no means to have broken their strength, for his son Rameses II. was unable to conquer them. Rameses II. was unable to conquer them. The H. king. Mauthnuro, collected a vast army and prepared for a final struggle with Egypt for the possession of N. Syria. Rameses II. marched N. with his ormy, and a great battle was fought in the fields of Kadesh which ended in the victory of neither. After this a treaty was arranged, and the two kings formed an alliance, which seems to have been very necessary,

THE DEFEAT OF THE HITTITES AT THE BATTLE OF KADESH

against some other unnamed enemy, probably Assyria, who appears at this time as a growing danger. Trouble was also threatening from the Mediterranean— the islands were restless'—so these two great empires allied themselves for mutual protection. This is a very early example of an international agreement. Some years later this newly-formed friendship was cemented by Rameses matrying a H. years later this newly-formed friendship was cemented by Rameses marrying a H. princess. In Assyrian references, the H. (whom they call Khatti) appear as a powerful people, occupying Carchemish on the Euphrates. Sargon III., in 717 B.C., left records of how he finally overthrew the Khatti of Carchemish, and captured their king, Pisiris.

From all these records, and from the discoveries of archeologists, we gather a brief hist, of the H.

White Syrians, or Hatti, were found in Cappadocia, after the Cimmerians had destroyed Phrygia. Crossus, king of Lydia, defeated what remained of them. Boghaz Kesi formerly Pteria, is the only

surrounded the whole city. Many inscriptions and sculptured reliefs were found, and a number of tablets in Babylonian and in the H. language, among them a cunsiform copy of the treaty with Rameses II. Euyuk possesses remains of a large palace entered between sphinxes, a large paince entered netween spinitives, on one of which is sculptured a relief of a double-headed eagle; this device is said, without definite proof, to have been adopted by the Sejiuk Suitans of Konia, and to have been brought by the crusaders to Europe, where it was taken by the Ger. emperors as their arms. In various places, widely distributed, fragments of places, when distributed, fragments or pottery, sculptured lions, reliefs, and buildings have been discovered; in some of the buildings columns rested on bases

or the outlangs columns rested on bases carved with winged lions.

The style of all their sculptures is quite individual and easily distinguished from the Assyrian and Babylonian art. The facial type is very markedly non-Semitic, the figures are usually depicted short and the ngures are usually depicted short and heavily built, with prominent bones, broad-shaped heads, receding forcheads, long noses, thick lips, and short chins. The hair of the men is frequently worn in a pig-tail. The dress usually represented The hair of the men is request.

a pig-tail. The dress usually represented consists of a long robe worn over a tunic, a high conical cap, and long boots turned up at the toes. The outer robe was bordered with a fringe. The females wore a long veil or shawl covering the head and forehead and falling to the feet: one relief pictures two ii. women sitting to gother with this veil or mantle draped over a head-dress resembling a modern brimless top hat. Very little can be said by a head-trees resembling a modern brimless top hat. Very little can be said with certainty of their social conditions; one thing is clear, that their women enjoyed the same high status and freedom as in Babylonia. They appear to have adopted the Babylonian cult of the godadopted the Babyionian cuit of the god-dess listar (Ashtoreth); she is depicted in the sculptures of Boghaz Keul with a mural crown; the H. may have introduced her worship to Lydia where she became known as Cybele, 'the Great Mother of the Gods.' The bee was sacred to her, and a H. gem, found at Aleppo, represents her standing on a bee. Her priestesses who served her in Lydia are represented bearing a double axe, a symbol found frequently at Knossus in Crete. The Lydians, who were among the first to use coined money, employed the silver 'Mina' of Carchemish, i.e. a H. silver coin.

A new and possibly decisive stop to-wards deciphering the Hittite hieroglyphs powerful people, occupying Carchemish on the Euphrates. Sargon III., in 717 B.c., left records of how he finally overthrew the Khatti of Carchemish, and captured their king, Pisiris.

From all these records, and from the discoveries of archeologists, we gather a brief hist of the H.

White Syrians, or Hatti, were found in Cappadocia, after the Cimmerians had destroyed Phrygia. Crossus, king of Lydia, defeated what remained of them. Boghaz Kesi formerly Pteria, is the only H. city that has been really thoroughly to timmense size. The acropolis was strongly fortified, and a wall 14 ft. thick on a stone base with two bulis led by a female figure. Whole panels of the walls were covered with inscriptions, which were continued on the statue itself and on the sides of the bulls. It was found that the inscriptions on the walls were bilingual, those on the panels on the left of the entrance being in old Phenician and those on the right in Hittite hieroglyphs. They are dated about 730 s.c. The hope that by comparing the two texts one might decipher the hieroglyphs was strengthened when Prof. Bossert found the phonette rendering of the name of the city strengthened when Prof. Bossert found the phonetic rendering of the name of the city of Adana which figures in both texts. Since then he and other philologists have continued research work on the twin texts, and it is claimed that about one-third of the whole text of these hieroglyphic inscriptions has been deciphered. In the past some philologists had succeeded in reading the series of some hierogeneous products and the control of the series of some hierogeneous products. In the past some philologists had succeeded in reading the sense of some hieroglyphic ideograms, but no key had been found to the language represented by Hittite hieroglyphs, which was assumed to be a language of Indo-European origin. Prof. Bossert's discovery may provide the missing key to this part of the early hist. of Asia Minor. Hittite cuneiforms found earlier at Bogaz-Koy (Boghaz Keni: earlier at Bogaz-Koy (Boghaz Keul; anct. Hattushah) dealt with a period be-tween the fifteenth and twelfth centuries B.C., at which later date the cap. of the Hittite empire was destroyed by invaders. The hieroglyphs are beheved to describe events of a later period until about the sixth century n.c. and their deciphering sixth contury B.C. and their deciphering should yield information on historical and religious events and developments during the intervening six centuries. (Times, April 20, 1949.) Consult W. Wright, Empire of the Hillies, 1884; A. H. Sayoe, The Hithites, 1890; L. Messerschmidt, The Hittiles (trans. by J. Hutchison), 1903; D. G. RIVER.

Hoars-Laval Pact, pact signed by Brit. and Fr. representatives in 1935 in the hope Ger. physicist, b. at Bonn. At Munster of settling the condict between Italy and house of settling the condict between Italy and Abyssinia. Abyssinia, which was being in 1852-79 and director of physical laboratories from 1879-89. Resigned on account of ill-health; but, having recuperated, continued his labours. In 1862, H. and Pitcker discovered the influence of temp. on the spectra of substances. In the Mediterranean the members of the League could have assembled naval forces, with secure bases, easily sufficient to cope with Italy if the need 1869, H. performed experiments in relation to the passage of electricity through rarefied gases (which later led to the Crookes Tube and Röntgen Rays)—noticing, inter alia, the deflective influence to cut the communications between Italy and E. Africa. At Geneva 50 States aligned themselves against Italy; only 3—Austria, Hungary, and Albania—supported her. Certain economic sanctions had been agreed upon and applied. All that was necessary was that they should be extended to the supply of oil to make it impossible for Italy to wage effective war. There was good reason to believe that the United States would take part in such an embargo. But at that moment the Fr. gov. wavered: the sinister figure of Laval (q.v.) had omerged in control. Then the Brit. gov. of Mr. Baldwin weakened. In Dec. 1935, without any consultation with the League, the H. agreement was signed. Instead of pressing home the economic measures against Italy, it was Abyssinia that was to be ing nome the economic measures against Italy, it was Abyssinia that was to be constrained. Under the Pact she was to be called upon to surrender almost half her ter. with the sure prospect that the rest would be taken at the next opportunity. A storm of protest burst in Britain and France. Sir Samuel Hoare (foreign secretary) resigned. Layel was (foreign secretary) resigned; Laval was dismissed from his premiership. The Council of the League refused even to consider the proposals of the Pact. But the mischief had been done. From that mischief had been done. From that moment the heart was taken out of the League of Nations. Its moral authority disappeared. After a few months the sanctions against Italy were formally ended. The It. campaign, aided by poison gas, was pushed to a victorious end: and it was not long before the next Brit. Prime Minister, Mr. Neville Chambertities Users, was read at header lain, visiting Rome, proposed at a banquet the toast of 'The king of Italy, emperor of Ethiopia.'

Hoare, Sir Samuel John Gurney, see

TEMPLEWOOD, VISCOUNT.
Hoar-frost adorns trees, grass, and twigs in winter, because they freely radiate their heat. The cause of its formation is as follows: On a clear night formation is as follows: On a clear night dew is deposited because after sunset the earth cools and lowers the temp. of the atmosphere in contact, until its moisture begins to condense. This it will do as soon as the temp. has fallen below that

HOATZIN

point at which the air would just be saturated by the amount of aqueous vapour which happens to be present. Now H., instead of dew, is precipitated when at the time of its formation the temp, is already below freezing-point (32° F. or 0° C.). It is therefore not frozen dew, as such an expression would imply that the vapour was first of all deposited as dew, but rather water directly deposited in a solid form. If the dow-point is below 32° F., gardeners should screen young or delicate plants from the atmosphere, as there is every likelihood of a H. likelihood of a H.

Hoarseness, condition of the voice in which the sound is diminished in intensity and purity; it is usually accompanied by a feeling of pain or undue effort in pro-ducing sounds. H. is caused by the swelling or roughness of the vocal chords, the vibration of which causes the sound which we know as voice. It is possible that the roughness of these ligaments is sometimes due to fatigue or lack of tone in the muscles and nerves controlling them, but in the majority of cases there is them, but in the majority of cases there is definite inflammation of the mucous membrane of the larynx. H. is therefore usually indicative of some form of laryngitis, and should never be neglected. Inflammation may be set up as the effect of irritating vapours or dust, or as the result of a cold extended downwards from the nose or throat; it may be induced by fatigue through excessive use of the voice, or may accompany some of the voice, or may accompany some other disease, such as influenza. The swelling of the parts which interferes with normal voice-production may progress so as to constitute a danger to respiration. An attack of H. should therefore be construed as a symptom of laryngitis. Neglected H., particularly if associated with excessive use of the voice, may lead to a chronic condition in which a certain amount of inflammation is always present, amount of inflammation is always present, and a more or loss permanent change in the constitution of the pharyngeal membrane may take place. The treatment for laryngitis is rest in bed, inhalations of friar's balsam (a teaspoonful to a pint of hot water and the steam inhaled), cold or hot fomentations to the throat, and aspirin in small doses internally. Chronic laryngitis demands examinations of the laryng by a dector who is accustomed to larynx by a doctor who is accustomed to use a laryngoscope. The first essential in its treatment is rost for the voice, and sometimes silence must be maintained for a prolonged period. A simple alkaline douche, which clears a blocked nose, may he very helpful in this condition, but application of oily or astringent prepara-tions to the larynx may be necessary. This, however, requires the skilled hand of a surgeon.

of a surgeon.

Hoar-stones, called Hare Stanes in Scotland. They are single blocks of unhewn stone, which now serve the purpose of boundaries, but which must at one time have been commemorative. Usually they stand alone, though rarely a ring is indicated by pieces of rock clearly arranged by human agency.

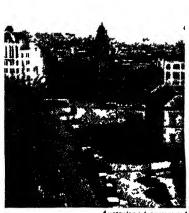

Hoatzin, or Hoazin, name given to the

galliform birds belonging to the family Opisthocomidæ, which consists of the single genus and species, Opisthocomis crisiaus. They are fowl-like in appearance and about the size of a pigeon, the plumage is olive with white markings, and reddish underneath, the sternum has a large patch of thick maked skip on which the large patch of thick, naked skin, on which the ising paternoi timer, naked skin, onwhich the bird generally rests They are chiefly arbor-eal, nesting on low trees or shrubs, but are also able to swim and divo The H., which ranges from Guinca to Venezuela, is also called the state bird, or stinking-pheasant, because of its strong, musky odour

Hoazin, see Hoazin, musky odour Hoazin, see Hoazin, musky odour Hoazin, see Hoazin, Ho built Incre are numerous saw and flour mills, iron foundries, and potteries, etc The Australian Newsprint Mills and the Electrolytic Z: Works are estab in the vicinity. There are important industrics dealing with the processing of small fruits apples, and pears H is the see of an Anglican bishop and a Rom Catholic archishop, and possesses many fine success parks. archiehop, and possesses many fine squares, parks, and buildings, among which the univ, the hall, and 5t Mary's Cathedral deserve especial note, and also a statue of the explorer, Franklin, who was governor here from 1837 to 1843 Here, too, are parliament buildings Pop 70,000 See Isabel Dick, Wild Orchard 1916, F Hurley, Garden of Tasmana, 1947 and C Barrett, Isle of Mountains, 1948 Hobart Pasha, Augustus Charles Hobart-Hampden (1822-86) admitted the Turk ish fleet, the son of the earl of Buckingham

Hampoon (1227-00) admired to the like higher, the son of the earl of Buckingham shire. Having won his captainty in the lang navy, he refired in 1862. As block ade runner during the Amer Civil war, he gained considerable distinction, but his daring and strategic ability were most in evidence during his blockade of Crete at the time of the insurrection, and during the Russo-lurkish war (1878), when he cleared the Black sea of the enemy I had entered the Turkish navy in 1867 Hobberna, Meindert (1638-1709), Dutch

landscape painter, was a contemporary of Berchem Van de Velde, and Wouver man, who sometunes inscried animals and man, who sometimes inserted animals and figures in his pictures. Save that he married, died in poverty like Rembrandt Hals, and Jacob Ruysdale, and was buried in the pauper section of an Amsterdam in the pauper section of an Amsterdam in the married, little has survived either about his personality or life. In this country he is honoured chiefly for his "Avenue at Middelharnis" 1689 (National Gallery, London), but his masterpieces are scattered over the museums of Antwerp, Brussels, Leningrad, Dresden, Rotterdam, etc. H. Malmesbury, April 5. He graduated at

was content to print his native woods and mills, hedgerows and pools, winding tracks and leafy cottages, but his manipulation of cloud and light, the truth and finish of his varied foliage, and the sympathy with which he expresses nature in her moods of tender melancholy and puritant calm, prove him the equal of Ruysdael in all except the broadness of his range. See monographs by W von Bode 1917, and G Broulhiet, 1958

G Broulhiet, 1958
Hobbes, John Oliver (pen-name of Mrs. Pearl Mary Theresa Craigie, nee Richards) (1867-1906) Amer novelist, made an unitypy marriage (18%), which was dissolved on her petition in 1891 Reared in an atmosphere of Nonconformity she entered the Rom Catholic Church in 1892, with the most all philosophy which as entend the Rom (atholic Church in 1802, and that mystra ip philosophy which so pervades The School for Saints (1897) and its sequel, Robert Orange (1900), was assuredly the cause or effect of this conversion. Her positive gentus for epigram is conspicuous in her first pub., Some I motions and a Moral (1891), and likewise in her Low and the Soul Hunters (1902).

Magdalen College, Oxford, and between 1610 and 1637 thrice went abroad as private tutor with the Cavendish family, 1610 and 1637 thrice wont abroad as private tutor with the Cavendish family, visiting France and Italy, where he made the acquaintance of the Cartesian Father Mersenne and of Galilco. Many other illustrious men, including Hen Jonson, Bacon, Lord Herbert of Cherbury, and, among foreigners, Descartes and Cosimo de' Medici were counted among his friends. His political principles were fundamentally opposed to those of the Long Parliament and from 1640 to 1652 he lived in France lest his opinions, mostly expressed in works then only in MS., should attract hostile attention. The plan of his philosophic work had already been formed and it was in this period that most of his works appeared. When his unorthodox opinions, particularly his ideas on religion, brought him into collision with the Church and the exiled court, he returned to England, submitted to the council of state and finally went into retirement in Hardwick, where he wrote a retirement in Hardwick, where he wrote a trans. of the *Iliad* and the *Cdyssey* (1676), *Bekemoth* (1680), and an autobiography in verse. For some time he was mathematical tutor to the Prince of Wales (afterwards Charles II.), and though, after the issue of the Leviathan (1651), his pupil issue of the Leviathan (1651), his pupil forbade him his presence, yet the pension he freely gave to H. on his accession (1660) showed that he knew no other feelings than gratitude and respect for his former teacher. The Honeric and Thucydidean trans., and likewise the many controversial writings of the philosopher, which at the time loomed so important, have long been condemned to the dust of oblivion; his Behemuth, or narrative of the Civil war (1640-60), is now a curiosity in literature. But his De Cive (1642 and 1647), and his magnum opus, the Leviathan. both of which were censured by parliatoer, and his magnum opus, the Levidhan, both of which were censured by parliament in 1666, gave 'an extraordinary inpulse to the spirit of free inquiry in Europe' and have won for their author the title of founder of political science, as other of his works take him the true father of Eng. psychology. In 1640 he wrote a treatise in defence of the royal prerogative. H., who was besides a great stylist and one of the first to deen his prefixe language worthy of convesting native language worthy of expressing abstruse thought, taught that the end of abstrues thought, taught that the end of philosophy was social, and that theology and transcendentellsm did not come within its sphere; that the basis of all gov. is force and that, whereas to be effectual every gov. must be supreme the spiritual must ever give way to the spiritual must ever give way to the temporal, and the people must implicitly accept not merely the laws but the mode of faith which the king or his ministers have seen fit to ordain. Hobbes, like Bacon, asserts the practical value of knowledge and concentrates attention on nature and man to the exclusion of the supernatural; but he differs from Bacon on the rappropriate method of inquiry. Bacon regarded induction as the chief means of investigation, whereas H. held that the deficiency or synthetic method was superior to the analytic and, deeply impressed by the logical demonstrations of Euclid's Ele-

ments which he saw for the first time at the age of forty, always adopted the mathematical demonstration of his philosophic truths. He was fundamentally a materialist, seeking the basis of all knowmaterialist, seeking the basis of all know-ledge in sensation, and froju this material or mechanical conception of nature and man, he deduced his whole system of natural and civil philosophy. The latter, presented in his *Leviathan*, is the study in which his thought has had its most pro-found effect. The ethical and political philosophy of *Leviathan* may be briefly summarised: man in a state of nature is entirely notivated by appetite and desire and since all men are engaged in the attainand since all men are engaged in the attainment of their own objects of desire, altru-ism (a word, however, only invented by Herbert Spencer) has no place in their original nature—with the result that man's natural state is one of strife, enmity and war. Hence man must find a renedy by agreeing with his fellows to submit to a stronger power, and thus a commonwealth is estab, on the implied basis of a mutual covenant—a concept analogous to Rousseau's contrat social, except that Il's view of the natural man as a cept that It's view of the natural man as a selfish being is remote from the ideal of Rousseau. HOCKEY The Universities inside left makes a shot in a match against the Weasels

Hock, strictly the white wine (sparkling) 1883 still obtain in essentials or still), called in Germany 'Hoc hheiner,' produced at Hochheim The high name 'hock' has been in use since before 1625, and is commercially extended ilmost in-discriminately to light white Ger wines, especially Rhenish wines. If is usually dry, but some brands are sweet It has a distinctive flavour and bouquet and the alcoholic strength is from 9 to 13 per cent Important bruds are, Erbach, Nierstein Rudesheim, Marcobrunn (still) Johan-nisberg, Licbfraumich, Raucnthal (spark-ling). Good vintages were those of 1880, 1883, 1884, 1886, 1889, 1892, 1893, 1995, 1897, 1921, 1925, and 1929. The natural dry white wines of the Californian 'Riesling' or hock-grape slightly re-semble the Ger varieties, but generally have more 'body' and are less acid Hockey (possibly derived from the 'hooked stick' with which the game is played; cf. haguet, O.F. for shepherd's erook), game prayed with a ball or some similar object between two opposing sides; the stick used to propel the ball alcoholic strength is from 9 to 13 per cent

the equipment and tools of a H player the following are the more important points A H stick shall have a flat face on its left hand side only there are no regulation as to length, but every stick must be of such size that it can be passed through a two inch ring. The head of a strck shall not be edged with or have insets or fittings of hard wood or of any other substance nor shall there be any sharp edges or dangerous splinters; the extremity of the stick must not be out square or pointed but must have rounded edges An india rubber ring of four inches external diameter may be used as a guard, but the total weight of the stick a guard, but the total weight of the stick and guard and binding, if any, must not exceed 28 or The ball is a leather cricket ball, either, painted white or made of white leather Boots very similar to football boots are usually worn; no dangerous materials such as spikes or nails, etc., must be worn. The rubber ring is not now much used, padded gloves being worn instead. Ship, guards are from the worn instead. Shin-guards are, from the

nature of the game, almost a necessity. The ground for H. is of a rectangular shape, 100 yds. long and not more than 60 yds. nor less than 65 yds. wide. The ground is marked out with white lines, of which the longer are called the side-lines and the slower the coal-lines. and the shorter the goal-lines. Flag-posts are placed at each corner, and at the centre of each side-line, one yard outside the line. The goals are in the centre of the goal-line; The goals are in the centre of the goal-line; their dimensions are 12 ft. wide by 7 ft. high. The posts are 2 in. broad and not more than 3 in. in depth. Nots are attached to the posts, cross-bars, and to the ground behind the goals. No shooting at goal can take place except in the striking circle, which is thus defined: In front of each goal shall be drawn a white line 4 yds. long, parallel to and 15 yds. from the goal-line. This line shall be continued each way to meet the goal line by quarter circles having the goal-posts as centres. The game is played between two teams of eleven players each, positwo teams of eleven players each, posi-tioned as in association football. The game is started by one player of each team bullying the ball in the centre of the ground. To bully the ball, each player strikes the ground on his own side player surises the ground on ins own side of the ball, and his opponent's stick over the ball, three times alternately; after which one of them must strike the ball and so put it in play. In all bullies the two players who are bullying shall stand squarely facing the side-lines. A player is offside if he is nearer to his opponent's is offside if he is nearer to his opponent; goal-line than the person who last struck or rolled the ball in, unless there be at least three of his opponents nearer to their own goal-line than he is. No player can be offside in his own half of the ground, nor if the ball was lost touched or hit by one of his opponents. The penalty for off-side is a free hit. When a player strikes at the ball no part of his stick must in any event rise above his stick must in any event rise above his shoulders at either the beginning or the end of the stroke; the penalty for 'sticks,' as it is called, is a bully. In the case of breaches of the rules inside the circles a 'penalty bully,' or a 'penalty corner,' is awarded. When a penalty bully it played all players save the true corner, is awarded. When a penalty bully is played, all players, save the two taking the bully, shall remain beyond the nearer 25 yds. line in the field of play until the bully is completed. When a penalty corner is awarded, the player taking it shall have a hit from any part of the goal-line he may choose, at least 10 yds. from the nearest goal-post. At the moment of such hit all the defending team wast he behind their own goal-line and must be behind their own goal-line, and all the attacking team must be out-ide the an the abbusing team mist be outside the striking circle in the field of play. A corner differs from a penalty corner only in that the hit is taken from a point within 3 yds. of the nearest corner fiag. The game is in charge of two umpires, who each have charge of half of the field who each have charge of half of the field 1878 with a story Her Benny, and many of play; if two unpires are not available one umpire and two linesmen take their place. Since 1895 International Matches between England, Scotland, Iroland, and between England, Scotland, Iroland, and Wales have been played, and Belgium (1878). The Awakening of Anthony Weir and France now play England. There is (1901), Plemeers (1905), The Third Man an international championship, and H. is (1911), When He Came to Himself (1915),

one of the events in the Olympic Games. Co. matches are also played and Div. Association matches.

Association matches.

In America ice H. is so popular that the term 'hockey' is used for that variety, and the other game is called field H. The game differs from Eng. ice H. in sev. respects (see ICE HOCKEY).

Ice polo is a game very similar to ice H., played almost exclusively in the New England states. It is played with a rubber-covered ball and a heavier stick. Five men only play on a side and there is rubber-covered ball and a heavier stick. Five men only play on a side, and there is no offside rule. The rink is 150 ft. in length. Ring H. is a variety of H. which can be played on the floor of any gymnasium or large room. The goals are 3 ft. high and 4 ft. in width; six men are on a side, a goal-kooper, a quarter, three forwards and a centre. A ring of 5 in. diameter, with a 3-in. hole in the middle, and weighing from 12 to 16 oz., is used instead of a ball. The stick is a light but tough wand, from 36 to 40 in. in length, 1 in. in dlameter, and with a 5-in. guard at a distance of 20 in. from the lower end. The end of the stick is inserted into the hole in the ring; a goal from the field counts 1 point, and from a foul, ½ point. Roller polo is an adaptation of ice polo to roller skating rinks, and is very popular roller skating rinks, and is very popular in the U.S.A. Flve players form a side. See E. E. White, The Horkey Player, 1909; E. H. Green and E. E. White, Hockey, 1912; M. Pollard, Hockey for Women, 1931; E. Green, The Arts of Hockey, 1931; E. Ricketts, Hockey Manual for Umpires and Players, 1932; P. Robson, A Manual of Hockey, 1934; D.S. Milford, Hockey, 1938; T. S. Dagy, Hockey in Ireland, 1945.

Hocking, Joseph (1855–1937) Eng. novelist, b. in Cornwall, younger brother of Silas K. H. (q.v.). Educated at Owen-College, Manchester, and became a land-surveyor in 1878; but left this profession roller skating rinks, and is very popular

of Silas R. H. (G.T.). Educated at Owen-College, Manchester, and became a land-surveyor in 1878: but left this profession in 1884 and entered the Nonconformis ministry (United Methodist Free Church)—for the noxt few years travelling in Egypt, Palostine, Greece, Turkey, and Syria. His pubs include:—Jabez Easterbrook (1891), Story of Andrew Fairfax (1893), Fields of Faur Lenour (1896, The Scartet Women (1899, which caused some stir in Free Church Circles), The Purple Robe (1900), The Trampled Cross (1907), God and Mammon (1912), The Purple Robe (1900), The Eterna Challenge (1929) Out of the Depins (1930), The Squire of Jabuloc (1935), Deep Calleth Deep (1936).
Hocking, Silas Kitto (1850-1935), Eng. novelist, b. at St. Stephen's, Cornwall; third son of James H. Educated for the ministry of the limited Methodist Free Church and ordained minister in 1870. He Renny, and many others followed: nost of them better returned.

1878 with a story Her Benny, and many others followed, most of them being very

rural England. The derivation is uncertain; the term hock-day was in use by the tweifth century. The chief pastime was that of 'binding' members of the opposite sex (men on Monday, women on Tuesday) till a small payment was made for release. The money was used for church or par. purposes. 'The Old Coventry Play of Hock-Tuesday' was revived on Elizabeth's visit to Kenilworth (1575). See J. Brand, Popular Antiquities, 1777; W. Hone, Every-day Book, i., 1826. i., 1826.

Hoddesdon, par. and vil. of Hertfordhire, England, 4 m. S.E. of Hertford, 14 m. from Broxbourne Junction. Izaak Walton used to fish here on the R. Lea, whose waters fill the most of the old Rye whose waters fill the moat of the old Rye House I m, away, where, had the plot not gone astray, Charles II. and his brother James would have been assassinated in 1683. II. was a coaching station on the Old North Road. Pop. 7040. Hodeida, Hodaida, or Hodidah, fort and seaport of the Yemen, Arabia, on the E. coast of the Red Sea, 100 m. from Mocha. A barbour is to be built at Bas-al-Ketib.

A harbour is to be built at Ras-el-Ketib, 10 m. away. A railway connects H., Ras-cl-Ketib, Sana's, and Amran. The chief exports are: Coffee, skins, cotton, and some pearls, senna, myrrh, sesame, and jowari (a kind of millet). Other grains are imported. H. was bombarded grains are imported. H. was bombarded and occupied by the Brit. in 1918. Pop.

Hodgkin, Thomas (1831-1913), Brit. historian, b. in London, of a Quaker family. After graduating at the London Univ. he entered business as a banker, at the same time applying himself to historical study, and soon becoming a leading authority on the hist. of the early Middle Ages. His chief works are: Italy and Her Invaders (8 vols., 1880-99), The Dynasty of Theodosius (1889), Theodoric the Goth (1891), Life of Charles the Great (1897), and vol. i. of Longmans' Political Misters of Maddle (1908)

History of England (1906).

Hodgson, Brian Houghton (1800-94),
Eng. Orientalist, entered the E. India Company's College at Halleybury, 1816, becoming a servant of the company, 1818, the was resident in Nepal, 1820-43, returning to England, 1858. II. wrote to was resident in Nepal, 1820–43, returning to England, 1858. II. wrote valuable papers on the ethnology, languages, and zoology of Nepal and Tibet, including Miscellaneous Essuys on Indian Subjects (1886). The libraries of London, Design 1980 of the resident of the subject Paris, and Calcutta have his collections of Oriental MSS. See life by Sir W. Hunter,

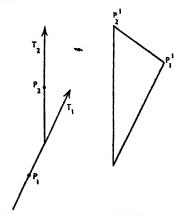

Watchers in the Dawn (1920), My Book of Memory (1923), The Mystery Man (1930), Gerry Storm (1934).

Hocktide, formerly a popular festival in England, kept on the second Monday and Mondaelmas were the rent-days in rural England. The derivation is uncertain; the term hock-day was in use by the tweifth century. The chief pastime was that of 'binding' members of sine as any in the language, notably The Last Blackbird, which appeared in 1907. as the as any in the singuage, notatily face Last Blackbird, which appeared in 1907. His longest and most clusive poem, The Song of Honour, is a piece of virtuosity in degree metre; his Ere is notable for its word-colour, and The Gypsy Gril a short but the butter of the state of the same than the same than the same that the same than th but striking dramatic poem. His *Poems* were pub. in 1917. Sev. of his poems appear in *Georgian Poetry*, 1911–17 (3 parts), ed. by Sir Edward Marsh. Awarded Polignac Prize.

Polignac Prize.
Hodgson, Shadworth Hollway (1832–1912), Eng. metaphysiciau; b. at Roston, Lines; son of Shadworth H. Educated at Rugby, and Corpus Christi College, Cambridge. First President of Aristotelian Society, 1880–94. Ho had tremendous crudition, but was handicapped by an involved style of expression. He claimed to have earth a system without outcomes. to have estab. a system, without onto-logical assumptions, on the lines of Hume. logical assumptions, on the lines of Finnies. Works include Time and Space (1865), The Philosophy of Reflection (1878), The Metaphysics of Experience (1898).
Hodmező-Vasárhely, in. of Hungary; connected by rail with Szolnok and Mako.

Pop. 60,000.

Hodograph. If a point P (see diagram) be moving in any path, and from any fixed point O a vector OP be drawn parallel

and proportional to the velocity of P, then 1896.

Hodgson, Ralph (b. 1871), Eng. poet and proportional to the velocity of P, then and prof. of Eng. literature at the Imperial Univ. of Japan. Mingles fantasy positions of P is called the H. of the path of P. Let P, and P, the time from P, to P, and of experience. A number of his poems are expressions of original happioness contrasted with something like the shock of disillusionment—contrasts not P,T, and P,T, and proportional to the velocity of P, then and proportional to the velocity of P. Let P, and P, the time from P, to P₁ boing very small. Then the tangent proportional to the velocity of P. Let P, and P, the time from P, to P₁ and P, T, an velocities at P₁ and P₂ respectively. Then by the triangle of velocities, P₁·P₂· represents, in magnitude and direction, the change of velocity of P during the small time, i.e. P₁·P₂· is proportional to the acceleration of P. As P traces out its path, so P¹ traces out the H. and the velocity of P¹ in the H. represents, in magnitude and direction, the acceleration of P¹ in the original curve. In particular, if P moves with a uniform velocity in a circle, P¹ describes a circle with a uniform velocity. Hence P has a constant acceleration. celeration.

Hodometer, see Phinometer.
Hodson, Major William Stephen Raikes (1821-58), Angio-Indian soldier, leader of light cavalry in the Indian Mutiny, usually known as 'Hodson of Hodson's Horse,' Educated at Rugby and Cambridge, he joined the Indian army in 1845, fighting in the first Sikh war. Rising to be commander of the Puniah Corps of Guides, 1852, he was dismissed in 1855 for harsh administration and alleged errors in the regimental accounts. On the outbreak of the Mutiny he rode with despatches from Karnal to Meerut and back, and was allowed to raise his famous regiment of horse (Corps of Guides, Punjab Irregular Force) and became head of the Intelligence Dept. H helped in the reduction of Delhi, and afterwards brought in Bahadur Shah, the last of the Moguis, as dur Shah, the last of the Moguls, as prisoner, but tho, the three princes down to overawe the mob. His conduct over this and over money matters has been severely censured, and he was even accused of 'looting.' He was killed in an attack on Lucknow. See G. Hodson, Hodson of Hodson's Horse, 1833; Bosworth Smith, Life of Lord Laurence (app. to 6th ed.) 1885; T. R. Holmes, Four Famous Soldiers, 1889; and History of the Indian Mutiny, 1899; L. T. Tretter, A Leader of Light Horse, 1901; and Sir C. Chamberlain, Remarks on Captain Trotter's Biography of Major W. S. Hodson, 1901. 1901.

Hodza, Milan (1878–1944), Slovak statesman, son of a Protestant pastor. Entered the Hungarian Parliament in 1905 as the sole Slovak representative. Interned in 1914 for systematic criticism of the Hungarian gov. Was one of the leading advocates of co-operation between the different othnical elements in the Ozechoslovak State, of which he was the ore the lower of the deal of a commonwell the lower than the common of the lower than the lower ponicy based on Czecoslovak political apport of the ideal of a commonwealth of sovereign independent Central European States, linked together by cooperative solidarity. In his Federation & Central Europe (pub. 1942) he advocated a Foderation of Danubian States for

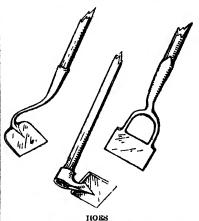

estab. in 1937. He resigned just before the Munich Pact for he foresaw only too clearly what terms would be imposed on his country. He became Vice-President of the Czechoslovak State Council in London, but controversies over his foreign policy and his peasant policy of agrarian democracy widened the breach between him and Dr. Benes and he preferred to migrate to the United States, where he died.

Hoenir, lesser god of Norse mythology bours.' In 1935, when the political horizon was growing black, he became spoken of by the Vanir (gods of the atmosphenos) from Minister. He hastened the realisaphere, to whom he was given as hostage tion of Ruthenlan home rule, which was by the Aesir, he plays no prominent part

of the world, it rose afresh from its ashes.

Hof: (1) tn. in N.E. of Bayaria, Upper
Franconia, 30 m. N.E. of Bayreuth, on the Saale. It was destroyed by fire in 1823, since when it has been almost entirely rebuilt. Before the Second World War H. was a noted seat of the textile industry, and had manufs. of calloo, cloth, and hosiery. It has a hospital founded in 1262, and some interesting churches. Jean Paul's earlier years are closely associated with the tn. Pop. 45,000. (2) Tn. in Norway, 50 m. N. of Christiania. Pop.

5000.

Holer, Andreas (1767-1810), Tyrolese patriot peasant-leader, b. at St. Leonard in the Passier valley, where his father was an innkeeper, which trade H. inherited, and in addition dealt in wine and horses with the N. of Italy. In 1809 he called the Tyrolese to arms to expel the Fr. and Bavarians, and they responded with ardour, and swept the latter out in seven weeks, overwhelming them at Sterzing, By this victory the Austrians temporarily occupied Innabruck and H. was conspicuous amongst the insurgent leaders. By the treaty of Schonbrunn, the Tyrol was again ceded to Bavaria, and although

By the treaty of Schönbrunn, the Tyrol was again ceded to Bavaria, and although H. again took up arms, he had to disband his followers and seek refuge in the mts., where he was betrayed, captured, and shot. See lives by K. T. Heigel, 1875; and A. von Bossi-Fedrigotti, 1935.
Höffding, Harald (1843–1931), Dan. hilosopher: b. in Copenhagen where he was educated. School teacher, 1861–1871; then prof. in univ. of Copenhagen. He progressed, from the opinion of Kierkegaard with relation to the separateness of Faith and Knowledge, into Positivism with qualifications. Works include: Den myelske Ficosoft i vor Tid (1874), Den humane kitk (1876), Psykologi i Omrids poa Grundlag af Erfaring (1882), Etik, (1887), Psykologiske Undersögelser (1889), Kontinutielen i Kant's filosofske Udnik-lingsgang (1893), Den nyere Filosofs Historie (1894–95), Det psykologiske Grundlag for logiske Domme (1899), J. J. Rousseau og Nans Filosoft (1896), Mindre Arbeider (1899–1905), Heligiansfilosoft (1901), Moderner Filosofer (1904, Eng. trans., 1914), Den menneskelige Tanketyner (1927), Erindringer (1928), Erkendelsesteoriens navær-nde Stilling (1930).
Hoffmann, August Heinrich, known as Hoffmann von Fallersleben (1798–1874), Ger. poet and philologist, b. at Fallersleben

as one of the triad. When consulted his in Lüneberg, his father being the mayor invariable answer was 'Let others advise'; so Mimir had to be sent with him to the Vanir and the gods lost their of the Vanir and the gods lost their chief counsellor. He is described as the lord of the Ozze, and is sometimes represented with long legs like a stork. II., with Odin and Lodhurr, gave life to the first to use the divining rod. Some identity him with Tyr. Uhland calls him the singer. He played an important part when, after the last great battle and the destruction of the world, it rose afresh from its ashes, it should be sent the first to resign his chair, and then travelled for three years, returning to Prussia after the revolution of 1848. He wrote, Horas of the world, it rose afresh from its ashes, its limited by the sent the should be shou to resign his chair, and then travelled for three years, returning to Prussia after the revolution of 1848. He wrote, Hora Belgicæ (1830-62), Geschichte des Deutschen Kirchenlieds (1832), Soldalenlieder (1809-70), Mein Leben (autobiography ed. by F. Gerstenberg 1892-94). A selection from his works was ed. by H. Benzmann (1924). See lives by J. M. Wagner, 1869-1870 and H. Reuter, 1921. Hoffmann, Ernst Theodor Wilhelm (1776-1822), Ger. writer and composer, b. at Königsberg. He assumed the name Amadeus in place of Wilhelm in homage to Mozart. In 1792 he entered the univ. of his native city to prepare for a legal career, and in 1795 began to practice as a jurist at Königsberg, subsequently going

Jurist at Königsberg, subsequently going to Berlin; but music interested him more than his legal duties. In 1706 he was appointed assessor at Posen; but his brilliant powers of caricature got him into trouble, and he was obliged to leave Posen. In 1804 he was transferred to Posen. In 1804 he was transferred to Warsaw, where he made the acquaintance of Werner, but was forced to quit office in 1806, when Warsaw was occupied by the Fr. For the next ten years he led a precarious existence, supporting himself by composing and giving music lessons. In 1816 he was appointed councillor of the Court of Appeal. Some of his shorter tales appeared in the collection Phantasiestucke in Callots Manier (1814), and were followed by the gruesome novel. Dis followed by the gruesome novel, Die Eliziere des Teufels (1915-16). Two other collections are Namistucke (1817) and Die collections are Namistucke (1817) and Die Serapionsbruder (1819-21) the latter of which includes pictures of Ger. I'fe and incidents from It. and Fr. hist., as well as gruesome tales; indeed it contains Das Fraulein vm Scuddri, generally considered his best work. Other books of his are Klein Zaches (1819), and the autobiographical Lebensansichten des Katers Murr (1820-22). His fairy tales, Der Goldene Topf, were trans. by Carlyle in German Romance (1827). He also wrote an essay on Mozart's Don Juan, and composed an opera on Fouqué's Undine (1816). Offenbach's opera, The Tales of Hoffmann, is founded on some of his tales. H. was one of the master novelists of Ger. Romanticism, and his works are remarkable for their humour and realism. His collected works, ed. by G. Ellinger, were able for their humour and realism. His collected works, ed. by G. Ellinger, were pub. in 1894; his lotters and diaries ed. by H. Muller, in 1812 and 1815 respectively. See studies by W. Harioh, 1920; E. Kroll, 1923, K. Ochsner, 1936; and W. Bergengrun, 1940.

Hofmarm, August Wilhelm (1818-92), Ger. chemist, b. at Glessen. He first studied law and philology at Göttingen, but later turned his attention to chem., and in 1845 was appointed director of the

and in 1845 was appointed director of the

Royal College of Chem. in London. From von der Pflanzenzelle and Allgemeine 1856 to 1865 he was chemist to the Royal Morphologie der Gewöcker. Mint, when he returned to Berlin as prof. of chem. and spent the rest of his life in that city. His work covered a wide range of organic chemistry—his contribu-tions to the scientific jours, were mainly on this subject. He also devoted much labour to the theory of chem. types. His chief works are: Introduction to Modern Chemistry (1865), The Life-Work of Liebig (1876), and Chemische Erinnerungen (1882). See Memoriul Lectures delivered before the Chemical Society, 1893—1900 (1874). 1900 (London).

Hofmann, Josef Casimir (b. 1877), Polish planst, b. at Cracow. Pupil of his father (prof. at Warsaw Conservatory). Made his appearance before the public at the age of six, and three years later made a tour of Europe, becoming a celebrated musical prodigy, Visited the United States in 1887-88 and, after studying two years under Rubinstein made his debut st Dresden in 1894. Has pub. planoforte compositions and is one of the leading modern planists. Since 1898 has lived principally in America. Director and Press of Charle 1995, 38

principally in America. Director and Dean of Curtis Institute of Music, 1926–33.

Hofmannsthal, Hugo von (1874–1929), Ger. poet and dramatist, b. at Vienna, where he was educated. Literary success Holmannsthal, Hugo von (1874-1929), Ger. poet and dramatist, b. at Vienna, where he was educated. Literary success came to him early, with the pub. of two or three books of poems before he was twenty. Later ' in his career he produced a number or romantic plays and also furnished the librettos for sev. of Richard Strauss's operas: Elektra (1909), Der Rosenkavalier (1911), Anadne auf Nazas (1912), Die Frau ohne Schatten (1919), Die agnytache Helena (1920). His works (besides the above-mentioned libretti) include: Gestern (1891), Des Tod and des Tud (1893), Der Abenieurer und die Sängerin (1893), Der Abenieurer und die Sängerin (1907), Prosaische Schrigten (1907), Gedichte (1910, 1922, 1925), Christinas Hemreise (1911), Jedermann (1912), La Légente de Joseph (1914), Alkestis (1916), Der Schwieripe (1921), lichen und Aufsatze (1921), Die Hochzeit der Sobeide (1922), Das Salzhurger Grosse Weitheater (1922), Protrische Epigramme (1923), Der Turm (1923), Der Erzahlungen (1923), Der

Pos Salzinsper Gross by extended (1923), Per Unbestechtiche (1923), Der Unterhe Epigramme (1923), Der Turm (1925), Dret Erzuhlungen (1927). See studies by O. Heuschele, 1929; H. Temborius, 1932; K. J. Naef (with bibliography), 1938, and E. Brecht, 1946.

Holmeister, Wilhelm Friedrich Benedict (1824-77), Ger. botanist, b. at Lelpzig, where he was educated and entered business as a music-dealer, studying botany in his spare time. In 1863 he was appointed to a professorship in Heidelberg, and nine years later was transferred to Tübingen. In 1851 he pub. his prin. work, Vergleichende Untersuchungen der Kennung Entfaltung und Fruchtbildung höherer Kryptogamen und der Samenbildung der Coniferen (1851), which stands in the first rank of botanical books, and is a typical work on plant-morphology.

Morphologie der Gewöchse.

Hofmeyr, Jan Hendrik (1845–1909), S. African politician, b. at Cape Town, where he was educated, leaving school at the age of sixteen and becoming a journalist. He joined the staff of the Volkevriend, which he bought in 1861 and amaigamated with the Zuid Afrikaan, under the title of Ons Land. In 1879 H. entered Parliament, where he remained for sixteen years, becoming leader and envisement of the becoming leader and spokesman of the Dutch party in the colony. In 1887 he was one of the Cape delegates to the first colonial conference held in London. Until the Jameson Raid of 1895 he was a sup-porter of Cecil Rhodes.

Hofmeyr, Jan Hendrik (1894–1948), S. African statesman and historian. Came to Oxford as a Rhodes scholar and become principal of the Univ. of Witwatersrand at the age of twenty-five. His financial acumen attracted the attention of Gen. Smuts, and at the age of thirty he was appointed administrator of the Transvaal. in 1929 he entered Parliament as member for Johannesburg and took a leading part in the movement for the reconciliation of Gen. Smuts and Gen. Hertzog and the reunion of S. Africans of Brit. and Boer trock, from which the United Party originated. In the coalition gov. of 1933 he was minister for the interior, education, and public health. But his sympathies for the Bantu pop. soon made him unpopular with many of the Afrikaners. In 1936 he strongly opposed the Bill to destroy the Cape native franchise, and in 1938 he resigned in protest against the action of Hertzog in appointing as a representative In 1929 he entered Parliament as member licrizog in appointing as a representative of native interests in the Senate a defeated colleague with no special qualifications in that respect. When the Second World Colleague with no special quantications in that respect. When the Second World War broke out H. rejoined the gov, as munister of finance. He was often called upon to deputise for Gen. Smuts and in 1913 was formally appointed Deputy Prime Minister. In the 1948 elections his liberal attitude towards the non-Kurenceau races allegated many electors. Furopean races alienated many electors, but his party supported him, and it was but his party supported him, and it was generally understood that he would lead it when Gen. Smuts should retire; and he remained in the foretront of the opposition to Dr. Malan's poi cy of segregation. His South Africa (1931), a hist. of the country, is instructive on native policy, the author rejecting segregation, racial fusion, and equality slike, and treating the whole problem as a question not ing the whole problem as a question not of politics so much as economics. See T. MacDowell, Jan Hofmeyr: Heir to

Smuts, 1948.

Holwil, estate some 6 m. to the N. of Bern in Switzerland, which was purchased by Fellenburg to start his educational institution. See Fellenburg, Philip Emmanuel von.

is a typical work on plant-morphology. H. also contributed two notable parts to a handhook of physiological botany, never and author, b. at Barton-on-Humber; completed, under the titles of Die Lehre eldest son of Rev. George H., incumbent

of that place. He was educated at Winchester and at Magdalen College, Oxford, and was a tuto at Magdalen 1880-93. He explored Asia Minor in 1887, 1890, 1891, and 1894. Lycayated at Paphos, 1888; Der el-Bahari, 1894; Alexandria, 1895; in Fayum, 1896; Naukratis, 1899 and 1903; Ephosus, 1904-05; Assuit 1906-1907; and Jerahius, 1911. He was director of the Brit "chool at Athens, 1897-1900, and conducted excavation sat Cnosus and the Dictaran Cave, 1900. In 1909 he became keeper of the Ashinolean Museum, a post he held till death. In the First became keeper of the Ashinolean Museum, a post he held till death In the First World War, he was director of the Arab Rureau at Cairo. C.M.G., 1918. His pubs, include: Devia Cupria (1990), Modern and Ancient Roads in Asia Minor 1990). Modern and Ancient Roads in Asia Umor (1892), Philip and Alexander of Vlacedon (1897), The Nearce East (1902). The Peneration of Araha (1904), The Archaic Arlemana of Ephesus (1903), Jonia and the East (1909), Accidents of an Antiquarie's Life (1910). The Ancient Fast (1914), Carchemish I. (1914), The Balkans (1915), Hittis Seals (1920), Irabia (1922), The Wandering Scholar (192).

Hogarth, William (1697-1764), painter and engraver, and founder of the Brit School of Paintang, b. in London. He began to draw at an early ige and was

began to draw at an early age and was apprenticed to a silver-plate engraver,

WILLIAM HOGARTH Lugraving after a self portrait (in the National Gallery).

finishing his time at the age of twenty when he started engraving on copper. In 1724 he pub on his own account his plate 'Masquerades and Operas, Burlington Gate,' but he first became known as an engraver by his plates for Butler's Hudi-bras, of which the last two, representing the Burning of Rumps at Temple Bar' and the Procession of the Skimmington, are the best He next turned his attor-tion to oil-painting, executing 'small tion to oil-painting, executing 'small conversation pieces, from twelve to

He was educated at Win-Magdalen College, Oxford, reputation by "A Harlot's Progress," a scries of pictures in which he portrays the Minor in 1887, 1890, 1891, cavated at Paphos, 1888; 1894; Alexandria, 1895 and Servis, her passage through a "Martin's summer" as the mistress of a rich Jew, to "Captain Macheath" and Drury Lane, to Ruidewell and beating home to disease Bridewell and benting hemp, to disease and death, to a shameful funeral, and a forgotten grave. This was speedily followed by 'A Rake's Progress, which did not meet with equal success, owing to the fact that it attacked the vices of the the fact that it attacked the vices of the man instead of those of the woman. 'The Fair,' or Southwark Fair,' depicts the carnival suppressed in 1762 in 1738 he attempted 'the great style of historynainting,' and produced on a staircase of St Bartholoniew's Hospital two Scripture stories,' The Pool of Bethesda and 'The Good Samaritan,' but those did not meet with the errourscenter he expected so Good Sanarican, out these did not meet with the encouragement he expected, so he again turned his attention to his former work and painted the 'Strolling Actresses dressing in a Barn, 'The Enraged Musician,' The Distrest Poet,' etc. In 1745 H had a sale by autton of his In 1745 H had a sale by auction of his pictures, and the ticket of admission was the techning known as the 'Battle of the Pictures' The same veer his master-piece, the 'Marriage à la Mode' (now in the Tate Gallery), appeared, which represents a variety of 'Modern occuriences in high lite' and in 1716 his portrait of 'Garick as Richard III.' for wikh he received £200, as well as that of 'Simon, Lord Lovat' In 1747 he produced 'The 'tage Coach' and the series 'Industry and Idleness,' in 1756 'The Invasion,' and in 1761 'The Bathos,' his last work He also painted a portrait of himself which resulted in the pub of The last work He also painted a portrait of himself which resulted in the pub of The Analysis of Beauty (17.3) H is principally famous as a satirist on canvas, and as such his never been surpassed; he represented the foibles of his time in a series of engravings which exhibit character, humour, and power. Until recently little attention has been paid to H 's drawingy, some of which are in the royal collection and others in the possession of the marquess of Exeter There are some 85 known and surviving examples of these. H did not, it seems, make a practice of sketching from nature, nor did he usually make studies for separate figures in pic-tures and prints. Preparatory drafts of whole compositions form the majority of whole compositions to the insignity of the drawings and of those nearly all refer to prints rather than to pictures. None of the drawings, probably, was ever intended as an end in Itself, or a final expression of an idea, yet the liveliness of if 'a mind, his sense of fun, horror, or disgust, his faciling for character, is nearly always present in them II 's house in Hogarth Lane, Chiswick, is now a museum where some of his works may be seen. See J. Nichols and the Steevens, The Genurae Works of William Hogarth, 1817; J. B. Nichols, Anecdone of William Hogarth written by himself, 1833; A. Dobson, William Hogarth, 1879; A. P. Oppé, The Drawings of William Hogarth, 1879.

Hogg, Sir Douglas McGarel, see HAIL-

Hogg, James (1770-1835), called 'The Ftfrick Shepherd,' poet, b. at Ettrick, Selkirkshire, was the son of a small farmer. He was entirely self-educated, but at an early uge began to compose verses, though the setting of these to paper was at in t a task of great difficulty. He first appeared in print in 1800 with the patriotic song, Donald McDonald, which became popular at once. Encouraged by his success, be, in the following year, publis Scotts of Pastorals, Poems, and Songs Ta 1800 his west Scott and art less often. In 1802 he met Scott, and not long after became friendly with Allan Cunningham. His next pub was The Mountain Bard (1807), and in 1197 he issued The Forest Minstrel, which was not a financial success. Three years later appeared the admirable work, The Queen's Wake, and in 1816 Madoe of the Moor. In that year he also brought out The Poetic Mirror, or The Linng Burds of Great Britain, a vol. of parodies of the leading poets of the day, including Scott, Coleridge, Southey, Byron, and Machineth Assert his approximately. including Scott, Coleridge, Southey, Byron, and Wordsworth. Among his subsequent books are: The Browne of Bodsbeck, and other Tales (1917), The Jacobite Relies of Scotland (1919), Winter Evening Tales (1520), The Private Memories and Confessions of a Justified Sinner (a work of genius, anticipating the psychological thrillers' of the twentieth century anonymously, 1821); and Queen Hynde (a poem, 1926). He contributed to Blackwood's Magaine many articles some of which he collected in 1929 under some of which he collected in 1929 under some of which he collected in 1829 under the title of the Shenheri's Calendar, and in 1834, to the great annoyance of Lockhart, he printed The Domesic Manners and Private Life of Sir Waller Scotl, a book that is now too seldom read. He has been described as the greatest poet after Burns, that has ever sprung from the common people, and it is certain that he attained to very great heights when dealing with to very great leights when dealing with local or legendary stories, while his gift of imagination was so great as tightly to be outsiled gonius. Much of his work was be entitled genius. Much of his work was mediocre, but he had in a great degree the lyrical gift, and his poems, II hen the Ku come Hame and Flora Macdonald's Fare well are exquisite. H. wrote his Auto biography. See Mrs. Gardon, Memorials of James Hogo, 1885; H. T. Stephenson, The Ktirick Shepherd: a Biography, 1922; E. O. Batho, The Ktirick Shepherd,

Hogs, Quintin (1845-1903), Eng. philanthropist, seventh son of Sir James Weir H., b. in London. He was educated at preparatory schools and Eton, which he left in 1863 and entered business, being first with a firm of tea merchants and later with sugar merchants. Philanthropy, however, was the main concern of H.'s bic, and in 1864 he started a ragged school for bovs. In 1881 he purchased the Royal Polytechnic Institution in Regent Street for providing young men and women of for providing young men and women of the lower middle classes with instruction, recreation, and social intercourse, and thus successfully initiated the polytechnic movement in London.

Hogget, see under Pio.

Hogget, see under FIG.
Hogland, small is, situated in the gulf of
Finland, 110 m. W. of Leningrad. In
1788 a battle took place here between the
Russians and the Swedes. There are
extensive quarries of granite and porphyry. It has an area of about 11 sq. m. Pop. 800.

Hogmanay, name applied in Scotland and a few parts of England to the last day of the year, viz. Dec. 31. It is also used for the cake given to the children who beg for gifts on the morning of that day. If unlarks the beginning of New Year holidny festivities in Scotland.

Hogmanay, N. Amer. Columing snake.

Hognose, N. Amer. colubrine snake (genus *Heterodon*) with a flattened head and a snout like a hog's. It is not

poisonous.

Hog's Back, range of chalk hills, 160 ft. high, which extends from Guildford to Franham, Surrey, England. It is triversed by an old coach road which affords a splendid view of the surrounding country.

Hogshead, liquid measure of capacity, varying with the nature of the contents, but equivalent for wine to sixty-three gallous, and for ale and beer to fifty-four gallons. In England it has now fallon into disuse, but the measure still obtains in the United States, and is equivalent to with three Amer gallons. The etymology of the word has been much discussed and its origin is uncertain.

Hogue, or Hogue, La, roadstead on the b. side of the N. part of Cotentin Peninsula, France, dept. Manch, off a rocky and dangerous coast. Give its name to the naval victory of the Eng. and Dutch over the Fr. in 1692.

Hohenelbe (Vrchlabi), tn. in Czecho-slovakia on the kibe, 1 m. N.E. of Gits-chin. It is engaged in various branches of manuf., principally the textile industry. Pop. 22,000.

Hohenfriedberg (Polish Dobromierz), tn. m Silosta, 3, m. W.S.W. of Wrocław (Breslau) Poland. Noted for Frederick the Grent's victory over the Austrians and

the Great's victory over the Austrians and Savons in 1715. Pop. 2008.

Hohenheim, Philippus Aureolus Theophrastus Bombastus von, see Paracelos.

Hohenheim, vil in Württenberg-Baden, Germany, 7 m. S. of Stuttgart. A royal castle, built in 1785, is stuated in the neighbourhood: this was, later, used as an agric, scademy with botanical gardens. The sturges on the staipness are by The stuccoes on the staircase are by Isopi.

many, situated on the R. Lenne, 5 m. E. of Hagen. It is the seat of an iron industry and has textile manufs. Pop. 4000.

Hohenlinden, vil. in Upper Bavaria, Germany, 20 m. E. of Munich, Germany, celebrated for the victory gained there over the Austrians, by the Fr. and Bavarians under Moreau in 1800. The battle is described in Campbell's lyric of the name. Pop. 970.

Hohenlohe, former principality of Germany in Franconia, now comprised chiefly in Wurttomberg and Bavaria.

Hohenlohe - Schillingsfürst, Chlodwig Kari Viktor, Prince of (1819-1901), Ger. statesman, b. at Ragaz. Was appointed chief minister of Bavaria in 1866, and endeavariate to luting about the union of S. deavoured to bring about the union of S. and N. Germany, but was forced to resign. During the Franco-Ger. war he advocated the alliance between Bavaria and Prussia. the alliance between Havaria and Prussia. In 1873 he was appointed, by Bismarck, Ger. ambas. in Paris, and in 1885 became governor of Alsace-Lorraine; he was imperial chancellor in 1994, and led the active Ger. colonial policy. He resigned in 1990. See J. Zickursch, Politische Geschichte des neuen deutschen Kaiserreichs, 1630 1930.

Hohensalza (Polish Jnowroclaw), tn. in the prov. of Poznan, 66 m. E.N.E. of Poznan. Until 1905 known as Jung-Breslau. Salt works and saline springs

are in the vicinity, and there is a sugar-beet industry. Pop. 34,100.

Hohenstaufen, Ger. princely house, members of which were emperors or Ger. kings from 1138 to 1251. The earliest known member of the family was Freder ick von Buren, who d. at the end of the eleventh century. His son, Frederick built a castle at Staufen or H., and called built a castle at Staufen or H., and called himself by this name. He was a supporter of the Emperor Henry IV, who gave him the duchy of Swabia, and when Henry was absent in Italy acted as vicegerent. In 1105 he was succeeded by his son Frederick II, the one-oved, who, together with his brother Conrad, held S.W. Germany for their uncle, the Emperor Henry V. On the death of Henry in 1125, his estates fell to Frederick, but Lothair the Saxon being chosen emperor, a furious war broke out which ended in the submission of Frederick. In emperor, a furious war broke out which ended in the submission of Frederick. In 1138 Conrad was elected emperor of Germany as Conrad III., and was succeeded by his nephew, Frederick Barbarossa, in 1152. Other emperors of this family were Henry VI. (1190-97), Philip I. (1198-1208), Frederick II. (1212-1250) and Conrad IV. (1250-54), the male line becoming extinct in 1208, when Conradin was put to death in Italy by Charles of Aujou. See Holy Romay Empire. See F. W. Schirrmacher, Die letzten Hohenstaufen, 1871. J. Bühler, Die Hohenstaufen, 1925.

Hohenlimburg, tn. of Westphalia, Germany, situated on the R. Lenne, 5 m. E. of Hagen. It is the seat of an iron industry and has textile manufs. Pop. 4000. Hohenlinden, vil. in Upper Bavaria. Germany, 20 m. E. of Munich, Germany, celebrated for the victory gained there over the Austrians, by the Fr. and Bavaria lans under Moreau in 1800. The battle is described in Campbell's lyric of the name. Pop. 420 became the ancestor of the Swabian branch. On the death of Courad, his son Burgrave Frederick III. was the representative of the Franconian branch, and he took a prominent part in Ger. affairs, securing the election of Rudolph of Haps-burg as Ger. king in 1273. In 1415 Bur-grave Frederick, the son of Frederick V., received Brandenburg from King Sigisreceived Brandenburg from King Sigismund, becoming margrave of Brandenburg as Frederick I., and in 1701 the elector of Brandenburg, Frederick III., became king of Prussia. (A learned survey of the H. dynasty in the eighteenth century is to be found in the introductory part of Curlyle's Frederick the Great.) In 1871 Wm., the seventh king, took the title of Ger. Imporor. The Swabian line was divided in 1875 into the branches of Heablinger. in 1576 into the branches of Hechingen and Sigmaringen. These continued un-broken until 1849, when they fell into the hands of Prussia. The proposal to raise frince Leopold of Hohenzollern-Sig-maringen (1835–1905) to the Sp. throne in 1870 was the immediate cause of the war between Germany and France. war between Germany and France. Prince Charles of H.-Sigmaringen became king of Rumania in 1881. The Hs. reached the acme of their power after the estab. of the united Ger. Empire following Bismarck's wars of 1861, 1866, and 1970-71. The H. king of Prussia was thenceforth the Ger. Emperor, and Prussian traditions became the accepted order of the real country. order of things in place of the old cultural and cosmopolitan life of S. and Central Germany. The apirit of the house of H. sought its expression in militarist ambition, and its leading figure was the Kaiser, tion, and its leading neutre was the Kasset, Wm. II., who almed at world domination in the First World War, through the conception of Mittel Europa. After the military collapse of Germany in 1918, Wilhelm II (d. 1941) fied to Holland and the H. dynasty came to an end. But the house of H. still hoped to return to the throne throughout the duration of the post-war Ger, republic and even subsequently, in spite of the opposition of the Nazis to the restoration of the monarchy. Prince Wilhelm and his second son, Louis Ferdinand. His elder son, Friedrich Wilhelm, was killed in Flanders in June, 1940, but, in any case, had forfeited his claim by marrying a woman of unequal birth.

EMPIRE. See F. W. Schirmacher, Die letzten Hohenstansen, 1871. J. Bühler, Die Hohenstansen, 1925.

Hohenstein-Ernstthal, in. in Saxony, Germany, 12 m. N.E. of Zwickau. Textile manufs. and knitting are the chief industrice. Pop. 17,500.

Hohenzollern, Ger. imperial dynasty, which traced its origin back to the ninth century to one Count Tassilo, who built

land bounded on the S.W. by Baden and on all other sides by Württemberg. Its of world-wide repute. His knowledge of area being 441 sq. m., and pop. of 78,000. technique and his draughtemanship were alike extraordinary and his drawings and industries are agriculture and cattle-colour prints had considerable influence and cattle-colour prints had considerable influence and cattle-colour prints had considerable influence. industries are agriculture and cattle-rearing. Iron. coal, gypsum, and salt are found, and there are also some mineral springs. The castle of H. was destroyed

found, and there are also some managers, springs. The castle of H. was destroyed in 1423, but has been restored sev. times, the present one being built by King Frederick Wm. IV. H. is now included in the Land of Württemberg.

Hohenzollern Redoubt, very strong tactical point in the Ger. line during the First World War, situated just S.W. of La Bassée. During the battle of Loos in the autumn of 1915 the Brit. operations included the ariack against the H. Redoubt. cluded the attack against the H. Redoubt. Fighting here was of the most desperate nature and lasted from Sept. 27 to Oct. 13. At the first onelaught the Brit. gained it, but Gor. counter-attacks, carried out with great fury, were at once launched against it incessantly, and a see-saw situation ensued into the first week of Oct. The decreet fighting raged round the trenches named 'Big Willie' and 'Little Willie,' in allusion to the ex-Kaiser and his son the ex-Crown Prince. On Oct. 3 the Ger. regained most of the position and on the 8th they launched an attack against both Brit. and Fr., which was repulsed heavily. Brit. and Fr., which was repulsed heavily.

A final Brit. assault was made by a div.

of Territorial in Oct. 13, which at certain
places carried the line beyond the redoubt.

In this action the Territorial Battallons
of the Sherwood Foresters gained great
distinction, and Capt. C. Vickers of that
regiment earned the Victoria Cross.
Despite the great exertions of the Allies,
the results of this offensive were fee from the results of this offensive were far from satisfactory, as the Brit. slone had 50,000 casualties and reaped but small advantages.

See monograph by C Glaser, 1908 Holbein, Hans (1497-1543), Holdein, Hans (1437-1743), the Yourgor great Ger painter, b at Augs-burg Little is known of his early years, but in 1015 he went to Basle with his brother Ambrosius, and while there drow brother Amoresus, and while there are williustrations for Erasmus's Praise of Folly, which were as popular as the work itself Besides this he painted the portraits of the burgomaster, Jacob Mever, and his wife, and the evaluate skill of the artist is shown in the elaboration of every detail in the rich embroidery of the latter's attire In 1117 he was in Lucerne, and was employed by the mayor of Lucerne was employed by the mayor of Lucerne to decorate his house with wall paintings, but he soon returned to Basle, and excuted in 1519 the portrait of Bonifacius Amerbach, which is one of the most perfect of his works. Here, too, he was greatly occupied with mu il decoration, his celebrated 'Peasants' Dance' being a wall painting on a house at the corner of the Lisenguise. He also decorated the the history executed many original decorated. tn hall, and executed many original designs for glass paintings as well as for woodcuts, among which his book entitled the Dance of Death 19 the most famous

Madonna' The former was only discovered in the middle of the nineteenth century But marvellous as H 's paint-ings were, his fame in his own day rested on his portraits, and among these his portrait of Frashus at Longford Castle is worthy of mention, is well as his portrait of himself, both of which were excuted before his visit to I ngland. In 1:27 he before his visit to I ngland In 1:27 he came to London, and was introduced to Sh Thomas More, whose portrast he printed as well as that of Warham arch bishop of Cantorbur, and Pishop I lisher, besides eighty seven portraits on tinted paper in Windsor Custle. In 1523 he produced 'The Family of Sir I homas More,' a group of pottraits which has unfortu-nately been lost, and on his return to Basle painted a lifelike picture of his own family which is now in the Museum of that in In 1531 he was again in London, and executed portraits of the Ger mer chants of the Steelyard the most valuable of which is that of Joig Gyze (Berlin), much praised by Ruskin In 1533 he painted 'The Ambassadora' Soon after this he came under the notice of Henry VIII, and painted for him the picture containing Hour VII, Henry VIII, Jane Seymour, and kill aboth of York This masterpiece, noticed by van Mander, and mentioned in the account of the duke of Saxonv's visit to England in 1613, was destroyed by line in 1698 Besides this he painted a portrait of Jane Seymour, now in Vicina, and one of Morett in the now in Vicuna, and one of Morett in the Dresden Gallety H also executed designs for ornament, his drawing for the 'Jane Soymour Cup,' in the Bodleian Library at Oxford being perhaps the most beautiful example of this class of art in the world In 1537, on the death of Jane Seymour, he went to Brussels to paint the young duchess of Milan, a proposed candidate for the king shand (National Gallers), and in 1539 to Cleves to paint the Princess date for the king shand (National Gallers), and in 1539 to Clevis to paint the Princess Anna (Louvie) "Among other postraits of this period may be mentioned that of the duke of Norfolk, Martin Luther, Prince Edward, and another portrait of hunself. The importance of Hans Holbelu's work cannot be over estimated before his time portrait painting was scarcely before and it was be well first. before his time poterul painting was carcely knewn and it was he who first raised the art of painting to perfection in kngland, indeed, it may be questioned whether in many of the fluest requirements of portiature his work has ever ments of the Lafe and Works of Hans Holbern of the Lafe and Works of Hans Holbern in Holbern in Holbern with strength of the Mindle Month of the Lafe and Works of Drawings, 19.0 U (hristofiel, Hans Holbern 1910, His Koegler, Die Bilder zum Chebburh Hortulus Amma, 1943 Holbern, 1926 A Chamberhain, The Art of Holbern 1910, His Koegler, Die Bilder zum Chebburh Hortulus Amma, 1943 Holbern, 1926 A Chamberhain, The Art of Holbern, Ludwig, Baron (1684–1751), creator of modern Data literature, b. at He also designed a title page for More's Utopia, as well as for Luther's Ger trans, of the NT. Of his sacred pictures the Bergen and at the uniw of Copenhagen. In 1704 he came to England and spent two years amongst the Rivaries at Oxford, and in 1711 printed his first work, An Introduction to the History of the Nations scarcely knewn and it was he who first

of Europe. Soon after this he received the Nosenkrantz grant, the holder of which was expected to travel, and spent the years 1714, 1715, and 1716 visiting the various countries of Europe. On his return to Denmark he pub. his Introduction to Natural and Popular Law, and in 1718 became prof. of metaphysics at Copenhagon. In 1720 he was promoted to the chair of public elequence, and in 1730 to that of hist., becoming questor of the univ. in 1737, and a baron in 1747. Up to about 1716 his writings had been concerned with law and hist., but after that date he began a new class of humorous literature, and his Pedar Paars (1719) the conjunct of the class of the (1719), the earliest of the classics of the Dan. language, is a satire of the pedantic stiffness and stupidity of contemporary life and thought. In 1721 the first Dan. theatre was opened at Copenhagen, and Holberg produced in 1722 a Dan. trans. of L'Avare (before this no plays had been acted in Denmark except in Fr. and Ger.). This was followed by numerous original comedies between 1722 and 1725, amongst which may be mentioned Den Vægelsindede; Jean de Frince; Joppe paa Bjerget; Gert the Westphalten; Den politiske Kandestoher; and Henrik and Pernille, blumert typning des Greenbergel [1721] his most famous piece (produced in 1724). After the closing of the theatre he turned his attention to historical and philosophical writing and produced in 1726 phical writing. and produced in 1726 Metamorphosis, a poetical satire; Epistolæ ad virum perillustrem (1727), Description of Denmark and Norway (1729), Ilistory of Denmark (1732-35), Description of Bergen (1737), Universal Church History (1738), Biographies of Famous Men (1739-1715), Moral Reflections (before 1741), A History of the Joves. In 1741 appeared another classic in his famous poem, Neels Klim's Subterranean, Journey and from 1748-31 Epistles, his last pub. work. He also wrote his Autholiography, which, toalso wrote his Autobiography, which, to-gether with Pedar Paars and the Sub-terranean Journey, has been trans. into Eng. The importance of H. cannot be overestimated. He was the first writer in Europe of his time (endtting Voltaire), surpassing both Pope and Swift in genius, and created a literature for a country up to his time without books; indeed it is said that before II. went to Denmark the Dan, language was seldom heard in polite

Dan. language was soldom heard in polite society. See 6. Brandes, Ludvig Holberg et Festskrift, 1881.

Holborn, metropolitan bor. of London, bounded on the N. by St. Paneras and Finsbury, on the S.E. by the city of London, and on the S. and W. by the city of Westminster. 'Holebourne' means the stream in the hollow and elliptics to the stream in the hollow and alludes to the R. Fleet, over which a bridge was built the H. Fleet, over which a bridge was built and often depicted as making her bed in early times, now replaced by the Vianical times, now replaced by the Vianical times and the state of the chapel of St. Etheldreds in Ely Place (so called from the bishops of Ely who held land here as early as the thirteenth century); the par. church of St. Glies in the Fields dating from 1734, originally the site of a leper's hospital founded by Matilda in 1101; the church of St. Andrew built by Wren in 1686 firm of Townend Brothers, worsted

(burnt out in 1941), which numbers Sacheverell among its rectors; Lincoln's Sacnevered among its rectors; Lincoln's Inn, with its Tudor gateway, upon which Ben Jonson is said to have worked as a bricklayer; Gray's Inn, with its four-teenth-century chapel (a great part of which Inn of Court was destroyed in air raids); the half-timbered houses of Staple Inn and the Brit. Museum. H. has an area of 406 acres and a pop. of 22.400 22,400.

Holbrook, Norman Douglas (b. 1888), Eng. naval officer; b. at Southsea; son of Col. Sir Arthur R. Holbrook. When in or Col. Sir Arthur R. Hollsrook. When in command of submarine B.H., on Dec. 31, 1914, he dived under five rows of mines in the Dardanolles and torpedeed the Messoudich, a Turkish battleship. Although fired on and pursued by antiship without mishap. This, however, necessitated being submerged for nine consentive hrs. The first news the crew required on indiving the nevent ship were necessitated being submerred for mine consecutive hrs. The first news the crew received on joining the parent ship was the olicial Turkish confirmation of the Messoudich. For this exploit he was awarded the Victoria Cruss.

Holbrooke, Josef Charles (b. 1878), Eng. composer, b. at Croydon, son of a Bristol unuscian. His orchestral works include The Raren (1900), Queen Mab (1904), The Bells (1906), Apollo and the Scaman (1908). His operas include a Brit. legend trilogy: Walden).

T. E. Ellis (pen-namo of Lord Howard do Walden).
Holeroft, Thomas (1745-1809), dramatist and author, b. in London. He was successively stable-boy, shoomaker, tutor, and actor. In 1780 he pub. his first novel. Alwyn, or the Gentleman Comedian, in which he describes his own experience as a strolling actor. In 1781 his first comody, Duplicity, appeared, and in 1783 he visited Paris as correspondent of the Monning Heruld. He trans. Mariage de Figaro from memory, and produced it at Covent Garden in 1784, himself playing the title-rôle. In 1793 The Road to Ruin, his best and most successful play, appeared, and in 1802 his musical adaptation. I Tale of Mystery, was acted at Covent Garden. H. pub. numerous comedios and comic operas, besides novels and trans. also Human Happiness to poem). His was prais d by Lamb, and Halltt, who ed. his Memoirs (1816). Holda, Goddess of Teutonic mythology. Represented as a kindly goddess, figuring prominently in fairy lore. Regarded as the goddess of spinning and agriculture and often depicted as making her bedwhen it snows, the dakes being the bodfeathers flying about.

manufacturers, but he soon left the counting-house for the mill, and conceived the application of machine power to the various operations of wool-combing. In 1846 he became associated with Lister, and with him brought out a patent for a new method of carding and combing and preparing genappe yarns. In 1848 he opened a large fabrique at St. Denis, and in 1864 concentrated his business at Bradford, which soon became the largest wool-combing concern in the world. Holdenby House, see under HOLMBY.

Holdenby House, see under HOLMBY.
Hölderlin, Johann Christian Friedrich (1770-1843), Ger. poet, b. at Lauffen on the Neckar in Wurttenberg. Son of the chamberlain to a monastery, he became an orphan at an early age, and was a contemporary of Hegel and Schelling at Tubingen Univ. Became a tutor and a private coach at Jena, Frankfort-on-Main and Homburg. In 1801 he took up a teaching appointment at Bordeaux. In a teaching appointment at Bordeaux. In 1802 be became mentally deranged and was in an asylum at Nutringen. Dis-charged in 1804 he became a librarian at Homburg but in 1806 was admitted to the Tübingen asylum. For the rest of his life he suffered from severe melancholia with brief intervals of normality. In his early years was much under the influence of Klopstock and Schiller, for whose Neuer Thalia he wrote the first fragments of his great novel Hyperion. He was also a friend of the philosopher Fichte. An enthusiast for the ideals of classical Greece as they were then understood, he trans. the Antigone and the Oedipus Rex (1804) of Sophocles and wrote a fragment of a tragedy entitled Empedokics. Apart from the idealistic novel Hyperion (1793-99) he wrote lyric poetry which is melodious, rich in imagery, and of great verbal dexterity, often on classical models in Gk. metres. His collected poems were pub. in 1826, and his complete works in 1846. See V. Dilthey, Das Erlebnis und die Dich-tung, 1906 and 1939; F. Zinkernagel, Entstehungsgeschichte von Holderlins tung, 1906 and 1939; F. Zinkernagel, Entstehungsgeschichte von Holderlins Hyperion 1907; Er. Gundolf, Holderlins Archipelagus, 1911; C. Victor, Die Briefe der Hotima, 1921; Die Lyrik Holderlins, 1921; M. Moutgomery, Holderlin and the German Neo-Hellener Move-ment, 1923; S. Zweig, Der Kampf mit dem Dümon, 1925; W. Boehm, Holderlin als Verfasser des Altesten Systemprogrammes des deutschen Idealismus, 1921; J. Hoff-melster, Hölderlin und die Philosophie, 1942. 1942.

Holderness, flat and fertile dist. of the E. Riding of Yorkshire, England, between E. Riding of Yorkshire, England, between the N. Sea and the actuary of the Humber. A parl, div. of 216,551 acs. Pop. 19,500. Holdich, Sir Thomas Hungerford (1843–1929). Eng. explorer; b. Feb. 13 at Dingley, Northants. Entered Royal Engineers, 1862. Afghan war, 1878–80. Supt. Indian frontiers survey, 1892–98. Supt. Indian frontiers survey, 1892-98. In 1899, one of three Brit. commissioners on boundary of Chile and Algentina: made survey for King's award, 1902. Holding, in Scots feudal law, denotes the tenure subsisting between the feu superior and his vassal. A feu-farm H. is one by the terms of which the vassal had to pay the superior a yearly rent in money or in corn. A blench H. is one under which the vassal pays a nominal under which the vassal pays a nominal yearly duty. c.g., a rose, a pair of gilt spurs, the object being merely to acknowledge the superiority. A burgage II, is that by which burghs-royal hold lands of the sovereign specified in their charters of erection (see Burgat). A II, by a church, monastery, or other religious or charitable society is called a mortification (cf. Eug. Mortmain or II. 'in the dead hand'). See J. Erskinc, Principles of the Law of Scotland, 1895. Scotland, 1895.

Holdsworth, Sir William (1871-1943), Eng. jurist, educated at Dulwich and at New College, Oxford, where he lectured on law from 1895-97. Eketed Fellow at on law from 1895-97. Elected Fellow at St. John's, Oxford, 1897, and taught law thore for twenty years. Elected Vinerian Prof. of Eng. Law at Oxford, 1922, being in many ways the most distinguished occupant of the chair since Blackstone. From 1903-1908 he was also Prof. of Constitutional Law at University College, London and in 1910 he was appointed All Souls Reader in Eng. Law. At Oxford he weets the first three yels, of his work. Souls Reader in Eng. Law. At Oxford he wrote the first three vols. of his work A History of English Law, which gave him a world-wide reputation. As Vinerian Prof. he brought out a new ed. of his hist., Prof. he brought out a new ed. of his hist., the first 3 vols., appearing in 1922, the ninth in 1925. Meanwhile he had written Sources and Literature of English Law, An Historical Introduction to Land Law (a lucid elementary book on a difficult subject), and many articles in legal periodicals, Eng. and Amer. His works, The Historians of Anglo-Imerican Law (1927), Some Lessons from our Legal History (1928), and Charles Dickens as a Legal Historian (1928), were the outcome of his lectures in America in 1927. On his return from America he was appointed a member of the Indian States Inquiry member of the Indian States Inquiry Committee, constituted to help the Simon Commission, and in 1928 he went out to India.

From 1930 to 1932 he sat as a member of the Ministers' Power Committee. 1937 he publishers from Confinences in 1937 he public law, the chacted law, and the professional development of the law in the professional development of the law in the eighteenth century. In 1934 he was awarded the swiney Prize of the Royal Soc. of Arts, and in 1938 he went out to India again, this time as Tagore Prof. at Calcutta: the result was the pub. of Some Makers of English Law (1938). Made a member of the Order of Merit, 1943. His hist, is a great monument of learning, industry and good corts, earl in the industry and rood sense, and in it he digested and harmonised all the results of the latest Eng., Fr., and Amer. research; and the immense amount of search; and the immense amount of detail in the vols, never obscures his good judgment or perspective nor blinds him to general tendencies. Holguin, tn. in Oriente prov., Cuba; in a healthy, hilly region, 60 m. N.W. of Santiago de Cuba. Sugar and tobacco centre. Pop. 135,000.

Holiday Fellowship (Ltd.), The, venture in social service founded in 1913 by T. Arthur Leonard (q.v.), whese objects are to provide for the healthy enjoyment of leisure; to encourage love of the open air; to promote social and international friendship; and to organise holiday making and other activities with these objects. Starting with two Guest Houses—one in ing and other activities with these objects. Starting with two Guest Houses—one in North Wales and the other in the Lake District—it developed steadily, and by the summer of 1939 was providing more than 90 guest houses, walking tours, and other forms of community holiday in various parts of this country and abroad. Activities on the Continent took parties of guests into various countries where special endeavour was made to establish contact with the inhabs. of the places visited, and people from other countries were welcomed at Fellowship Centres in this country, both as guests and as memthis country, both as guests and as members of the staff. A principal feature of Fellowship holidays is the daily excursion, under competent leadership, so organised as to introduce guests as fully as possible both to the beauties and to the historical. literary, and other interests of the dist. literary, and other interests of the dist. Tramping on mountain, moorland, and footpath is particularly encouraged. Members of the Followship have also organised, in various parts of the country. some 80 rambling and social clubs, under the title of 'Lata' Troups.' For legal and business purposes, the H. F. is registered under the Industrial and Provident Societies Act, 1893, with registered office at 142 Great North Way, Hendon, London, N.W. 4. The capital required for its operations is subscribed in the form of £1 don, N.W. 4. The capital required for us operations is subscribed in the form of £1 shares, the holding of one or more of which, up to a maximum of ten, constitutes membership of the organisation. The work of the organisation is controlled by a General Committee, elected by the

shareholding members.

A kindred organisation to the H. F. is the Co-operative Holidays Association.

Fallow field, Munchester.

Holinshed (or Hollingshead), Raphael (c. 1520-80), chronicler, is said to have been a native of Cheshire. He came to London early in Elizabeth's reign, and was employed as translator in Wm. Wolfe's printing-office, rendering great assistance to Wolfe in the compilation of his Universal History; indeed H. wrote most of the description of the Brit. Islex. Wolfe, however, died before the work was completed, and it was consequently abridged, and appeared in 1578 as the Chronicles of England, Scotland, and Ireland. A second enlarged ed. was pub. in 1587, but did not meet with the approval of Queen Elizabeth, and in 1808 a reprint of the original was pub. in six vols. The Chronicles are valuable for their historical information, and are interesting as being the source from which the Elizabeths and are interesting as being the source from which the Elizabeths and in successions. as being the source from which the Eliza-

there is a fundamental factor operating in the universe towards the creation of wholes. H. embraces biology, psychology and physics, and claims to be necessary to the proper understanding of evolution. H. is something akin to the natural-istic conception of physical science, but that from beginning in realism it ends in idealism. See J. C. Smuts, Holism and Evolution, 1926.

Holkham, vil. of Norfolk, England, near the N. coast, 2 m. from Wells. It is famous for its hall, seat of the earl of Leicester, built in the eighteenth century in the Palladian style. The estate was bought in 1659 by John Coke, son of Sir Edward Coke, and here the earl of Leicester, known as Coke of Norfolk, carried out experiments of great benefit

to agriculture.

Holl, Francis Montague (1845–88), Engportrait painter, b. in London. He became a student at the Royal Academy schools in 1861, and first exhibited in 1864. After this date he was a regular contributor to the Royal Academy, but he did not begin portrait-painting until 1876, when he undertook a portrait of Mr. G. C. Richardson. This picture was exhibited in 1878. Among his best portraits are the Prince of Wales, the duke of Cambridge, Sir George Stephen, and Mr. W. E. Gladstone. R.A. 1883.

Holl, Karl (1866–1926), Ger. theologian and church-historian; b. at Tübingen. Assistant in Berlin Academy of Sciences, 1891; lecturer, univ. of Berlin, 1896. Prof.: Tübingen, 1900; Berlin, 1906. Rector of Berlin Univ. 1925. His Gesammelte Außeitze zur Kirchengeschichte Holl, Francis Montague (1845–88), En

of Luther.

HENRY FOX, FIRST BARON HOLLAND

as neing the source from which the Eilza-bethan dramatists drew their plots. Indeed, nearly all Shakespeare's historical plays, as well as *Macbeth, King Lear*, and Cymbeline are based on H.'s work. Holism (from the Gk. Shot, whole) name given to the philosophy which holds that

remained until 1755, when he was appointed secretary of state. He resigned in the following year, but in 1757 became Paymaster-General of the Forces, and in this lucrative office he amassed a vast fortune, by methods, it is said, not the most scrupulous. He took no active part in politics after 1763, when he was created

Holland, Henry Richard Vassall Fox, third Baron (1773–1840), Eng. statesman, b. at Winterslow House, Wittshire, only son of Stephen, second Lord H., and of Mary Fitzpatrick daughter of John. Earl of Upper Ossory. He was brought up by his metarnal grandfather and units of Upper Ossory. He was brought up by his maternal grandfather, and uncle, Charles James E., to whom he was indebted for his love of classical literature, also his strong Whig principles. He was educated at Eton and at Christ College, Oxford. After doing the grand lour, he returned to England in 1796; took his seat in the House of Lords, and made his maiden speech in the debate on the question of the Assessed Taxes Bill. He pub. Life and Writings of Lope Felix de Vega Carpio (1896), and Three Comedies from the Spanish (1807). In 1814 he visited Murat at Naples, and in 1816 strongly opposed the Bill for the detention of Napoleon as a prisoner of war. In 1830 he was chancellor of the duchy of Lancaster, which post with two short. Lancaster, which post with two short intervals, he held until his death. He wrote Foreign Remaniscences, and Memoirs of the Whig Parly during my Time, both ed. by his son, Henry Edward, fourth Lord Holland, See T. Macaulay, Essay on Lord Holland, 1848.
Holland, Sir Hanry Scott (1788-1873)

Holland, Philemon (1552-1637), called Values (1906), and Fibres of Faith (1910).
Holland, Philemon (1552-1637), called the translator-general of his age, b. at Chelmsford, Essex. Baving obtained his M.D. degree at Cambridge (1591), he practised medicine at Coventry, and became headmaster of the Free School there (1928). Itis fame rests on his trans. of Pilnys Naival Hispory (1601), Plutarch's Morals (1603), Xenophon's Cyropoxias (1632) and other classical works. He also pub. an Eng. version of Camden's Britannia (1610).

Holland, Str Thomas Erskine (1835-1936), Eng. Jurist, b. at Brighton; son of Rev. Thomas Agar H., rector of Poyntages.

Here at a later day, the same reac chained the tyrant ocean and his mighty streams the tyrant ocean and his mighty streams.

into subserviency, forcing them to fertilise, to render commodious, to cover with a beneficient network of veing and arteries and to bind by watery highways with the furthest ends of the world a country by nature disinherited of its rights. A region outcast of ocean and earth, wrested at last harrage of 30 km. (1925), the Wieringen-Friesland outcast of ocean and earth, wrested at last harrage of 30 km. (1930); the Wieringen-Friesland outcast of ocean and earth, wrested at last harrage of 30 km. (1932) and the Noordo-from both domains their richest treasures. A race, engaged for generations in stubborn conflict with the angry elements, was unconsciously educating itself for its great the struggle with the still more savage deepotism of man. In these words Motley sketches the cosmo- and techno-drama of water lake. The maintenance of the

A DUTCH VILLAGE BUILT ON SHELTERING COASTAL DUNES Zoutelande, Isle of Walcheren

The features of the lowthe Dutch folk. tne Dutch folk. The features of the low-lying Dutch landscape are too well known to need description but the placid aspect of the waterways, studded with the or the waterways, studded with the peculiar windnill with pumps for regulating the aipply of water gives no indication of the inmittgated toil that is represented by the dykes and embankments which hold the sea in check and keep canals and rive, from overflowing their banks. Mechanical drainage, however, has now practically ousted wind power. has now practically ousted wind power. The people have a waying that 'God made the sea, but the Hollander made the land,' and as far as their own land is concerned, that is perfectly true. They have turned the marshes formed by the delta of the Maas, the Rhine, and the Scheldt, into arable land and have reclaimed vast tractfrom the sea. The lands thus reclaimed are called noiders and are highly valued.

canals which run like a network all over the country, linking up riv. and lake, and the reclamation and drainage of the land are the work of a special public dept. called the Waterstaat, and involve the called the Waterstaat, and involve the country in an expenditure of considerably more than 2500,000 a year. Looks were in use on canals early in the fourteenth century. The largest look in the world, that at Ymuiden, on the canal connecting amsterdam with the sea, was opened by queen Wilhelmina in 1930. The people of Holland have many characteristics in common with the Brit. The Dutch are a freedom-loving people, inventive and industrious. They have all the courageous qualities of seafaring folk, and have proved themselves as a nation and as Mass, the Rhine, and the Scheldt, into proved themselves as a nation and as arable land and have reclaimed vast tractions the sea. The lands thus reclaimed to gain or retain liberty. Among her are called polders, and are highly valued. In 1918 an Act was passed to form a new skerck, Schouten, Lemsise and Tasman, prov. by damming and draining parts of Their colonial possessions, like those of Great Britain, are vastly out of proportion to the size of the mother country. Their E. Indian possessions include Java and Madura, Sumatra, the Moluccas, Celebes, Timor, parts of Borneo, and New Guinea; in the W. Indies, Surinam and Curação are their prin. possessions. After the defeat of the Jap. in 1945, however, the Indonesians rose in revolt against their Dutch overlords, demanding countlets Indonesians rose in revoit against their Duich overlords, demanding complete autonomy (see below under History; and DUTCH EAST LYDIES; INDONESIA; JAVA. The Boer nation are descendants of sixteenth-century Dutch colonists in S. Africa.

Communications.—The favourable situation of Holland, half-way between the North Cape and the straits of Gibraltar. on the most navigated sea of the world at the mouths of excellently navigable rive. communicating with the whole of Central Europe by a system of canals, makes the Europe by a system of canals, makes the country a natural gateway, as well as an emporium and centre of commerce. In this way two seaport tas, came into existence which play a very important part in the world's trade—Rotterdam and Amsterdam. The equipment of docks, quaye, store-houses, loading and unloading installations in both harbours is completely adapted to world shipping. Rotterdam, before the Second World War, depended for 75 per cent of its trade on land traffic to Germany and Switzerland and today the capacity of its docks exceeds the demands upon it because of the decline in the Rhine trade. In 1939 the number of Dutch vessels navigating the decline in the Rhine trade. In 1939 the number of Dutch vessels navigating the Rhine was over 6500, being 51 per cent of the total Rhine navigation. The country itself is intersected by a number of riva, and canals, linked to the water and railway transport system leading to the heart of Europe. The other Dutch ports, heart of Europe. The other Dutch ports, although smaller, have very modern equipment and good communications with Central Europe. N. of Amsterdam lies Zaandam, the port of the highly industrialised Zaan dist. The N. E. port of Delfziji specialises in coastal trade, notably to Seandinavia and England, as does Harlingen in the N.W. from which a number of regular services to England are maintained. Terneuzen, on the estuary number of regular services to England are maintained. Terneuzen, on the estuary of the R. Scheldt, is important chiefly in that it serves as a port to the local industries. On the map, it is observed that Holland is situated at the junction of important high roads of economical significance. England lies across the N. Sea. Beigium and France must Holland in the S., Switzerland and Czechoslovskia are also easily attainable. Central Europe are also easily attainable. Central Europe begins on her E. frontier and in the N are the Scandinavian countries. The inter-national airport of Schiphol near Amsterdam, is the central station for airlines flying in all directions of the compass even as far as New York, Rio de Janeiro, Cape Town and Batavia. Sev. important international airlines use the well-equipped ing in all directions of the compass even as far as New York, Rio de Janerro, Cape as far as New York, Rio de Janerro, Cape Town and Batavia. Sev. Important international airlines use the well-equipped landing-field at Soluphol, while it plays an important part also as a night-mail airlines (K. L. M.) have regular services to the most important this. in Europe.

Railways.-In Holland the system of Rattways.—In Holland the system of railways is not as congested as in some other W European countries, as a great share of the conveyance of merchandise is by inland navigation. As the railway train is mainly a passenger traffic, its speed surpasses that of neighbouring countries. A great part has been electrified. During the Ger. occupation in the Second World War the Dutch railways suffaced much by the great countries. the second work was the inter rainways suffered much by the war operations. After the liberation the situation of the railways was chaotic: hardly any locomotives were left, whereas the few that remained were so badly damaged that at the could not be used. Because were first they could not be used. Passenger-carriages and goods-vans had been trans-ported to the East, rails had been taken away as well as the overhead wires of the electric railway system.

Industry in Holland absorbs about 40

per cent of the working pop., which is rather a curious fact, taking into consideration that the country itself is short of raw materials. Iron-ore, wood and oil must be imported from oversess, only in the S. is coal obtained in considerable quantities, which covers part of the home requirements. Potential oil-fields are be-ing exploited in the E. part of the country. The output of the salt-mines in the E. can and even allows a considerable export of this commedity. The favourable loca-tion of ilolland makes it possible on the one hand for raw materials to be easily imported, and on the other hand for the industrial products to be as easily exported to all parts of the world. Conexported to all parts of the world. Con-sequently coupled with the experience and skill of the workers. Dutch industry is primarily one of retining, in which the raw materials are processed into products for export as may be exemplified in its superphosphate and oil-works. In normal times 70 per cent of the superphosphate production was exported. The oil fac-tories either delivered the oil obtained from copra and seeds to the margarineand soap-works or they exported the final product directly to foreign countries. Blast furnace works are estab. in Y muidon. Here imported ores are pro-cessed, the greater part of the iron being cessed, the greater part of the ron being again exported. Before the war Java furnished about 90 per cent of the world's production in cinchona, which for the greater part was used by Dutch industries. This was also the case with cocoa, rice and tin production. For non-tropical products, Holland was an important world supplier. The various breweries, the margarine and sonn-works as well as the gin and liqueur distilleries may be mentioned in this respect. The great labour productivity of the Dutch people has caused industries to be developed within the contraction. to be developed which demanded specialised labour, such as the diamond industry,

tries, handicrafts have flourished. The fine handswork of gold and silver smiths and other artificers, as well as the products of the furniture maker's, glazier's and industrial arts find their way to both the home and foreign markets together with industrial products

Mining — In the S., Holland possesses 12 mines all with modern equipment four the property of the gov In the years preeding 1940, the coal production amounted to dout 13 million metric tons, per annum. The Dutch mines supply a per annum The Dutch mines supply a type of coal best suited to industrial pur poses Before the Second World War part of the coul destined for industrial use was exchanged abroad for household coal After the liberation the production of coal owing to various causes such as under nourishment of the miners, lack of material enlistment of mine workers into the ser vices, the departure of foreign labourers, and labour conflicts which arose all over the world Through shortage of ship ping space the elimination of the Ruhr as a suppler, t. de line in the output of foreign collieries and miners' strikes abroad, the imports of coal were not sufficient to cover the requirements of the industries and private use However, the production rose from 325,000 tons per month in 1945 to 810,000 tons per month in 1917

As a secondary by product to coal mining reference can be made to coke and mining reference can be made to coke and briquette factories, chemical factories for the production of nitrogen, hydrochloric acid, chloride of lime, coal tar products, etc. The chemical works which manuf secondary products of coal have an important share in the industrial production of Holland. Thus, important industrial have been ested such as those of artificial manufactured and playing along the production of Holland. manure playtics dyes, phurmaceutical products, alcohol, lubricants, scap, artificial silk, perfumes, road covering materials, maccicides, saccharm and disinfectant. These articles form an important part of Holland's export It can be expected that the young industry, which is so closely linked up with coal mining, will considerably expand in the future

Agriculture and Horticulture — Owing to the dissemination of excellent agrarian information, and extensive research work, Dut h agriculture has succeeded in gaining, qualitatively, an important place in ing, qualitatively, an important place in the world Because of the density of the agricultural pop Dutch agriculture had to specialise in the production of fine agric, such as valuable seed crops, vegetables and fruit, bulbs and decorative plants. In addition Holland Ho

powder are known everywhere. About the products from the dairy industry were destined for foreign markets.

Agriculture and farming brought into existence the important industries of canned foodstuffs, potato flour and straw board. Heades the manufacturing industries, bandlerafts have flourished. The live the following figures before the which makes it possible to bring the above mentioned products fresh on the foreign mixts. Even aeroplanes are sometimes used for this purpose. The importance of the export of agric, products is shown by the following figures before the second World War Holland exported from 200,000 to 350,000 tons of potatoes; in no other country in Europe did the export of potatoes exceed 100,000 tons were exported against a bare 20,000 tons from other countries. The export of condensed milk amounted to 170 000 tons, Denmark only once reached a quantity of 20 000 tons and the exports of other countries were even far below this amount. The importance of Holland's export is also shown by the fact that of the total production of bulbs, treas, shrubs, vigetables and fruit, 90, 90 and 50 pc; cent respectively (according to their values) were expectively (according to their values) were expectively duction of bulbs, and 50 pc; cent respectively duction of bulbs, and 50 pc; cent for the total value of butter, cheese and milk powder produced was exported in the server value of butter, cheese and milk powder produced was exported in the same produced was exported in the same year export figures for poultry (for con sumption purposes) and egg production amounted to 28 per cent and 50 per cent respectively of the total value, although firthisers and fodder had to be imported Sein from this point of view it can be castly understood why Holland takes the fifth black among the wheet travertire. fifth place among the wheat importing untities, fourth place for the import of harly and third place for corn This implies therefore that Holland is an imortant buyer for grains on the world market The high standard of futch agriculture is also evident by harvest results, the se being considerably above the iverage for Europe in 1939

I isheres.—Fishing is one of the oldest Dutch trades which throughout the ages Dutch trades which throughout the ages has made important contributions towards the national income. The herring industry is intensively developed and bride 1940 Holland had a very modern hering fleet. In 1938 the herring catch amounted to 100,000 tons in weight which is presented a value of over £800,000 Many shaps were lost through war operatures or were weight hat the loss for year tuns or were rebuilt by the viers for war puposes in May, 1916, however, thanks to the initiative of shipping-companies and ashermen, a herring fleet again sailed tion Scheveningen for the first time since

the beginning of the war \remarkable activity has developed in to exploitation of modern refrigeration slaps. The whaling industry which in numer centuries used to be of great mputance in Holland, but decimed in later cars, has been reorganised. There is

portance in Holland, but useful. There is also oyster culture in the prov. of Zeeland. Defence.—The pre 1940 Army was composted partiy of volunteers and partiy of intuity of men drawn by lot for the years' service, and kept on a peach footing of nearly 400,000. The colonial army numbered mearly 40,000, of whom about 14,000 were Europeans. The chutterij are a kind of soldier pol aman who, in tames of war, can be mobilised. The armed forces are

Dutch Navy consists of an excert aircraft of the States-General and confirmation of carrier, Karl Doorman (13,800 tons), 2 the Bill by a two-thirds vote of the new cruisers of 3350 tons displacement and a armament of 4-in, and 6-in, guns; 7 Justice is administered by the High an armament of 4-in. and 6-in. guns; 7 destroyers, 12 submarines, 4 minelayers and other craft. Many of the ships of the pre-war Navy were assigned to the E. Indies Fleet. Both Army and Navy have their own separate Air Force.

Government and Justice.—The gov. of H. is a limited and hereditary constitutional monarchy. The executive power of the State belongs accurately to the

of the State belongs exclusively to the sovereign but is exercised by a responsible council of ministers. The legislative council of ministers.

Justice is administered by the High Court of the Nethorlands (Court of Cassa-tion), by five courts of justice (Courts of Appea), by nineteon dists tribunels, and by sixty-two cantonal courts. Trial by by sixty-two cantonal courts, Trial by jury is unknown. The Cantonal Court, which tries minor offences, is consituted of a single judge; the more serious cases are tried by the dist. tribundls, formed, generally, by three judges; the counts are constituted of three and the High Court of five judges. All judges are appointed

rests conjointly in the sovereign and states-General. The latter, or Parlia-High Court from a list prepared by the ment, is bi-cameral: the list or upper scomposed of fifty members, only be a High Court decision.

Culture, Education, and Italian.—In second chamber of 100 deputies elected directly. There is universal suffrage and the system of election is by proportional representation. Deputies are elected for four years and retire in a body, whereas the first chamber is elected for 6 years, one-half retiring in rotation every three years. The gov. and the second chamber only may introduce new Bills, the functions of the water sharplest palar satisfact. tions of the upper chamber being restricted to approval or rejection, without power of amendment. The meetings of both chambers are public, though each may, by majority decision, form itself into a private committee. The ministers may attend the meetings of the States-General,

only be a high Court decision.

Culture, Education, and Religion.—In practically every domain of art and science the Dutch have contributed a signal share. Although comprising only a small percutage of the European population, the Dutch people have on the whole an honourable share in European. culture and in some instances, have even made a preponderate contribution. In New York and Paris, in the National Callery in London as well as in the Hermitage in Moscow, the pictures of Rembrandt, I rans Hals, Ruysdael, and Johannes Vermeer bear witness to the clory of Duth meriting in the eventeenth glory of Dutch painting in the seventeenth century. Of the painters of a later perod Van Gogh and Breitner have especially become famous. The Amsterdam Symphony orchestra (Conzertgebouw) is among the best orchestras in the world. but unless they are members, they have become famous. The Amsterdam Symonly a deliberative vote. Alterations in the Constitution can be effected only by a among the best oracleostras in the world. Bill giving reasons, followed by dissolution.

anct. times onwards according to a deanct. times onwards according to a de-finite scheme, is from an architectural point of view one of the most beautiful cities in the world. The seventeenth-cen-tury buildings and the modern quarters vie in beauty and stateliness, thereby giving an excellent example of Dutch architectural taste. The numerous monu-mental churches all over the country with-in where wells are interestic surfitual life in whose walls an intensive spiritual life flourishes, also form a lasting reminiscence of the skill of Dutch architects (see further under DUTCH ART). The names of Erasmus, Huig van Groot (Grotius), Spinoza, are well-known names in hist. Stevin, Huygens, Swammerdam and Van Leeuwenhoek excelled in the technical sciences. At the many technical institutes and laboratories scientific pioneering labour has been effected and continuous research work is being done to find new methods and improve results. Since the 'Nobel' prize was instituted, it has been awarded on sey, occasions to Dutchmen: the scien-Lorentz, Zeeman, Van der Waals and Kamerlingh Onnes for physics, Einthoven and Eykman for medical science and Asser

for peace.

H. has a well-founded reputation for a n. nas a well-founded reputation for a superior system of education. It is compulsory under National Law (since 1920) for students to attend school up to their fifteenth birthday, misst students however avail themselves of an excellent system of some laws observed.

system of secondary schools.

The anct. univs. of Amsterdam Leyden, Utrecht, Groningen have been supplemented by the Rom. Catholic Univ. of Nilwegen and the Calvinist Univ. of Amsterdam: there are also three univs. specialising in agriculture, technical subjects, and economics. There are naval and military colleges at Bredu, and technical colleges at Delft.

Entire liberty of conscience is granted to the members of all religious confessions. to the members of all religious confessions. The royal family and a great part of the people belong to the Reformed Church. By the census of 1930, the adherents were: Dutch Reformed Church, 2,732,000; other protestants, 877,000. Catholics, 2,890,000; Jansenists, 10,000; Jews. 112,000; other creeds or those of none, 1,314,000 (other, 169,600, no religion, 1,144,400).

The language of H., though akin to both Eng. and Ger., has yet a separate identity. In the eleventh century the anct. Dutch dialects were spoken in a wider area than

dialects were spoken in a wider area than that now occupied by the present H. and Flanders, and old Dutch (or Flemish) is still to be heard among villagers in the N. of France. Early in the fifteenth century literary clubs were founded by the Rederlikers, or lovers of letters, who met together to study literature and plays. To these clubs modern Dutch owes its origin. From the twelfth to the sixteenth century

during the eighteenth century, but uniform speaking of the 'Standard' Netherlandish is still one of the aims of Flemish teaching in particular. In 1946 the spelling of Dutch was simplified after decades of discussion led by the fervid promoter,

of discussion led by the fervia promotes, Ipr. Kollewijn.

The liberty of the Press brought much foreign printing to H., and the Gazette de Leyde, which distributed news to all parts of the world, was in existence from 1680–1814. Illiteracy hardly ever occurs in H. Knowledge of foreign languages is customers rather than exceptional 8 fact customary rather than exceptional a fact common in small countries with export mrkts, and forced on the Dutchman by the fact that their own language is un-known to most of his customers. Longwave radio stations have been estab. at Hilversum and Hulzen, and a shortwave station at Zoesen, which is used largely for transmitting news to the Dutch colonies.

Librature.—During the late middle ages literary activity was concentrated almost entirely in the Flemish part of the country. Towards the end of the exteenth century, the Dutch language proper was perfected, owing this in part to national consciousness aroused by the religious persecutions in the S. Netherlands,
dominated by Spain. With the Reformation in H., the young independent country, owing something also to the migration of many Flemish Protestant families
to the N., became the centre of literary
life. The most brilliant writer of this
period, generally called 'De gouden ceuw'
(The golden century), was Joost Van den
Vondel (1587-1679), an outstanding poet,
whose successful tragedies are still
regularly performed. Important contemporaries are the popular allegorist and
moralist Jacob Cats (1577-1660) and the to national consciousness aroused by the remoralist Jacob Cats (1577-1660) and the more satiric humanist C. Huygens (1596-1687). P. C. Hooft (1581-1647) is the author of beautiful erotic poems and of one of the best comedies of that time and G. A. Bredero (1885-1618) depicted in his moral pieces vice in rude terms. This rub classical period of the Dutch literature ended in the last decades of the seven-teenth century. J. Luyken (1619-1712), a melancholic mystle, may be considered to be the last important poet of the goiden century. In the eighteenth century literature decined, being mostly mutative of Fr. models, but a major exception is W. Langendijk (1683-1756), writer of numerous and good farcical comedies. The first decades of the ninecomedies. The first decades of the nine-teenth century witnessed the rise, of romanticism. Willem Bilderdijk (1756-1831), A. O. W. Staring (1747-1840) and H. Tollens (1780-18.6) are the most characteristic figures of this transitional period. I. da Costa (1798-1860) trans, and introduced Fr. and Eng. romantic pacts to Duich readers. The romantic movement in H was encouraged by a From the twelfth to the sixteenth century per there was no unity either in the written or in the spoken language. A trans. of the Bible ordered by the Dutch Gov. in ed. by Bakhulzen van den Brink (1810-65) and carried out by the best Dutch and Flemish philologists further laid the and Flemish philologists further laid the foundation of modern Dutch. A uniform mode of writing was achieved in all provs.

national literature. Van Lennep (1802–1868) who first trans. Walter Scott into Dutch and wrote some remarkable historical novels, enjoyed great esteem, while important contemporary novelists were Limburg Brouwer (1795–1847). Anna Bosboom-Toussaint (1812–86) and Alberdingk Thilm (1820–89). At this time a group of brilliant writers, including especially N Beets (1814–1903) and P Hasebroek (1812–96) were founding their work on Eng. models but revealed their native originality in their observation of Dutch life. In 1860 the Nederlandsche Speriator appeared, a weekly seview associated especially with M P Lindo (1819–1877), an Englishman by birth and translator of Fielding and Sterne, and C Vosmaer (1826–88), an art critic and poet. In 1860 also was pub. Max Hawelcar. This book was an indictment of Dutch coloniva-1860 also was pub. Max Haveloar. This book was an indictment of Dutch colonisation written by Eduard Douwes Dekker (1820-87) under the pseudonsm 'Multatult.' It was undoubtedly the most important book of the century, and Dekker had a great influence on the succeeding generations, who greeted in him their pioneer. Those who derived from Dekker and bit sensettonsl were weten to note. pioneer. Those who derived from Dekker and his sensational work were the poets W. Kloos (1859-1938), F van Eeden (1860-1937), A Verwey (1865-1937) and the sensitive Van Deyssel (b 1864). They were ferrent adherents of 'art for art's take' and associated in a periodical De Neuver Gids (The New Guide), opposing them to the super annuated Guide. His that publication in 188, marked another. first publication in 188, marked another literary event in the second half of the interary event in the second that of the nineteenth century, inaugurating a prolific movement in which the poet H Gorter (1864-1927), the novelists L. Conperus (1863-1923) and J van Loov (1855-1930) and the dramatists H Heyermans (1864–1924), and Jan Fabricus (b 1871) stand out as pre-eminent Later (b) 1871) stand out as pre-eminent Lator writers are I Querido (1873 1932), author of naturalist novels and the poets P C Boutens (b 1870), J H. History—The inhabs, of the Nether-lands are descendants of a people called

fendal system the country was divided into small sovereignties. In the year 922 Kirk became count of H, and the other Kirk became count of H. and the other Netherland provs. such as Namur, Hainault, Limburg, and Zutphen, were divided between various barous and counts, autocratic rulers, owning allegiance to the dukes or earls of Lorraine, Brabant, and Flander. Holland, Zeeland. Utrecht, Overlissel, Groningen, Drenthe, and Fuesland, which were afterwards to four the United States of the Netherlands, were chiefly under the rule of the counts of Holland and the bishop of Utrecht. It was during the five dismal centuries of feudalism: that cuties began to spring into unportance and cities began to spring into unportance and the rise of a world-wide commerce began. In 1381 the Netherlands became the property of the duke of Burgundy, and a little more than a contury later were nuited to Spain under Charles V The struggle for freedom and for civic and religious independence that was to last so long had already begun and came to a crisis in the reign of Philip II of Spain in the middle of the sixteenth contury, the immediate causes being the imposition of the Inquisition with all its horrors upon the people, and the maintenance of the contract once of a standing army. Win prince of Olange, known as Win the Silcut, was the king's lieutenant in Holland, Zeoland, and I trocht, and to his devotion to the cause of the rights and liberties of the people the republic ultimately owed its existence It would cover too much space to give even an outline of the story of the war even an outline of burghes against political and religious tyranny. By the capture of Briel in 1572 Spain received the first everyea, and the people who had been ground into dust began to hope. In 1579 the Union of Utiecht was formed, by which the N. provs. banded themselves fourther to people spain and in 1581 the which the is proved balance and in 1581 the Notherland declared their freedom Win's assassination 1584 did not present the continued success of the people ignist the efforts of Philip to regain the dost prove. He was beaten again and again at sea, and his successor was obliged to sue for a cessation of arms for twelve These years enabled the Dutch to recoup themselves for losses by attention to trade. The war, renewed after the armistice, was continued until 1648, when, by the treaty of Munster Spain recognised the independence of the Netherlands.

While this protracted struggle was in progress, the Dutch were making themselves masters of the sea | heir ships were in every ocean | The E | India Comlands are descendants of a people called by the Roms the Batavi, who lined on an is, between the two branches of the Rhine, and the Fridans who dwelt further N They are decreased as a hardy, lio-pitable, faithful folk, who hunted fished, or led a pastoral life. Their religion was simple, and they were chaste and honourable. The Rom rule lasted until the fourth century, when the Franks overran the country. Charlemagne's dominion in the sighth century extended to the Netherlands, and he built a palace at Nijmegen on the Waal. Upon the estab of the destroying ships, in 1667. Then followed the war in which France and England were united against the republic; and which but for the Dutch prowess at sea, night have ended disastrously for the Netherlands. The political struggle be-tween the De Witt faction and that of the prince of Orange ended with the terrible death of the brothers De Witt and the triumph of Wm of Orange, who secured the friendliness of England by his marriage

were formed into the kingdom of the Netherlands. This union was not satisfactory: there were temperamental and religious differences between the people that were not easy to harmonise. In 1330, therefore, the S. provs. second and Belgium was formed into a separate kingdom. The decline of H. as a world-power after the seventeenth century would seem to have been due to some extent to the diverse Celtic and Ger. elements in the

with Mary of York. This led to his subwith mary of York. This led to his subsequent elevation to the throne of England, under the title of Wm. III. Eng. and Dutch then fought side by side in indicting defeat upon Louis XIV. of France. The treaty of Utrecht in 1713 concluded the war, and also the period of Holland's

greatness as a world power.

The close of the eighteenth century saw

pop.—elements dissimilar in their tendencies and always difficult to reconcile. The prin. events in the hist. of the kingdom since 1830 are, briefy, the following: In 1410 Wm., for political reasons abdicated an favour of his son, who, in 1848, granted a new constitution to the people. The question of the duchy of Luxemburg (from The close of the eighteenth century saw the Netherlands overrun by Napoleon's in 1868 by making it an independent state. Louis Bonaparte was made king of Holland in 1806, but resigned four years later and the country was attached to the Fr. empire. During these changes the Orange family had been obliged to make their family had been obliged to make their secape, but on the fall of Napoleon they were recalled, and the N. and S. provs. (b. 1909) became hoiress to the throne to 1.15 a title of the king of H.) was settled in 1868 by making it an independent state.

which she succeeded in 1948 (see below). The Palace of Peace, to which many nations contributed, was opened in 1913. It is situated at The Hague. H., after the Belgian secession from the joint king-dom set up in 1814, played little part in

European hist.

European hist.

In the last decades of the nineteenth century there arose a vigorous movement of material and intellectual expandion, a movement which had by no means spent its force even after the shocks of the First World War, which naturally affected H.'s overseas trade. In the inter-world war period, new industries were still coming into existence, as e.g. the Phillips electrical works at Eindhoven, the rayon industry at Breda; while, at the same time, agriculture, particularly cattle breeding dairy farming, and cularly cattle breeding dairy farming, and horticulture, all of which industries in the previous decades had begun to make good previous decades nad begin to diske good use of new methods of organisation and scientific research, greatly prospered. Again, the coalfields of S. Limburg, which owed their later development to the fact that during the First World War the supply of Ger coal became restricted, were exploited with considerable success: while the great scheme for the reclausation. while the great scheme for the reclamation of the Zuider Zee, so as to add a new prov. to the country, was launched (1924). (See supra). During the First World War H. remained neutral and consequently was not so seriously affected by it as the beligerent countries. The ex-Kaiser Wilhelm and the ex-Crown Prince Kaiser Wilhelm and the ex-Crown Prince found refuge at Amerongen when they fied from Germany in Nov. 1918. The ex-Kaiser settled at Doorn. Although faced with the problems arising out of the war (1914-18), the Dutch Gov. persevered with the policy of political and educational reform to which it was committed by the previous Liberal and Radical govs. of Kuyper and Bos. Probably the quickened sense of national solidarity accelerated the rate of social reform: for 1917 the gov had carried out its proin 1917 the gov. had carried out its programme. Universal suffrage and proportional representation were introduced: aona representation were introduced:
at the same time, the principle of absolute
equality with regard to the public exchequer of 'public' undenominational
education and 'private' denominational
education, was conceded in full and incorporated in the Constitution.

perated in the Constitution.

History during the Second World War.—
Ger. planes bombed Dutch this before dawn on May 10, 1940 and then land forces crossed the frontier. This attack had been expected, but its exact direction and timing were partly a surprise. The and timing were partly a surprise. The Dutch had no experience of modern warfare. It was five generations since the last hostile truops had entered their ter. They were now to receive the rudest awakening, and their situation was awakening, and their situation was aggravated by an immense Fifth Column aggravated by an immense Fith Column (q,v); for there were 100,000 Gers, living in Holland and a great many belonged to the National Socialist movement led by A. A. Mussert, a Dutch engineer in things as much as possible in the hands of the roads of Utrecht, who condistently followed the line of propaganda of Dr. Goebbels (q,v). Later, on May 10 to swell the ranks of the unemployed after

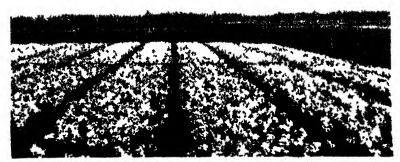

numerous Ger. paratroops were landed, especially on the big aerodrome of Waal-haven. The strategic situation in the vital S. of H. was weakened by the fact that the Dutch and Belgian defence-systems did not really gaupplement each other: and to some extent it may even be said that the Belgian system was based on said that the Belgian system was based on a Ger. occupation of the Netherlands, whereas the Dutch system envisaged the possibility that the Ger. forces would pass possibility that the Ger. forces would passe through the S. of the country and leave the heart of H. slone. On May 11 a Gor. armoured column entered Brabant and violent fighting occurred in the Hague. In the S. of the country Ger. armoured forces now constituted the gravest menace and, on the next day, they reached Dordrecht, thus cutting communications with Belgium and France. In the N. the Dutch succeeded in beating off a heavy attack when the Gers, tried to cross the Zuider Zee. The following day the Queen left on a Brit, destroyer for England and later that day was followed by the Dutch cabinet. The Dutch troops, forced back on the Grebbe Line, retired to the Water Linie but their reserves were fully occupied against paratroops and fifth columnists. On May 14 the Ger. armoured column reached Rotterdam and armoured column reached Rotterdam and heavy fighting took place between the Gers, on the S. and the Dutch on the N. of the riv. The Gers, now decided to destroy the centre of Rotterdam by air bombardment in order to force the Dutch to surrender, and within four hrs. 25,000 dwellings were destroyed and the entire centre of the city became a blazing inferno. In that single afternoon 30,000 persons purished and another 80,000 were homeless. The city was still 80,000 were homeless. The city was still burning a fortnight later, for the water mains were damaged. Without doubt thousands of people suffered lingering deaths under the burning ruins with no hope of rescue. Whole vils., too, were wiped out in a few hirs. In the face of this, one of the worst crimes of human hist., there was no course open to the Dutch commander but to surrender and the Dutch troops laid down their arms, though some continued to fight for some days in Zeeland. Thus ended the brief and tragic Five Days' war in the Netherlands (see further under Western Front I's Sixon Wordle Wasterdam on the 1tth. Ordinary life came to a standstill. Thousands of people committed suicide, most of them Jewish or non-Jewish refugees from Germany. To make a good impression on the Dutch Hitler appointed most of them Jowish or non-Jewish refugees from Germany. To make a good impression on the Dutch Hitler appointed Dr. Seyss inquart to be Ger. Commissioner for the occupied Netherlands. His supposition was that the Dutch would like an Austrian better than a Prussian, but the people had not forgotted Seyss inquart's betrayal of Austria. As in Belgium so in H. the Gors, tried to win the people by propaganda and cajolery. They announced that the New Order would leave things as much as possible in the hands of a 'reconstruction scheme' had proved a about national independence under the failure. The Nazification of H. was to be House of Orange. The programme of the organised so gradually that the Dutch new 'Nederlandsche Unie' seemed at organised so gradually that the Dutch would be hardly aware of the process. A council of Secretaries-General was to be the nominal gov., but the real gov. consisted of the Reichscommissioner and his assistants, while a group of Gor. officers were appointed to supervise Dutch provincial and municipal life. The Gor. order was characterised by its financial corganisation under which iterlin was the centre of a European system of multilateral clearing, which made it easy for the Reich to sap the economic resources of the countries occupied by their troops. Dutch factories which fitted into the Ger. war-machine had orders forced upon them. The Dutch wharves were used for constructing Ger. U-boats. Dutch engineering industry was soon working to full capacity on Ger. army orders. High prices were paid for agric. produce, but in reality the Dutch farmer was paid with reality the Dutch farmer was paid with the financial reserves of the Dutch people, of which his own reserves necessarily formed part. The damage of the Five Days' war was put at £200,000,000 or half the national income; but the Dutch State had to pay the usual costs of occupation, which were calculated at £6 per head of the pop., i.e. £48,000,000 a year or half the State's year, y venediture. Thus H. was crushed under its fluancial burdens and the standard of living rapidly declined. and the standard of living rapidly declined. Produce was carried away into Germany. Supplies, whether ample or scarce, were in the first place destined for consumption by the Ger, troops. The people were re-duced to the role of mere drawers of water and hewers of wood for the Gor. overlords. and newers of wood for the cor. overfords. Everything was done by Seyss Inquart to impregnate Dutch institutions with the 'Nordle culture'. A council of Englishenment was created to supervise the activities of the Press. The Dutch trade union movement was taken over by the Dutch Nazis and a 'Strength-through-loy' movement was organised under the Joy 'movement was organised under the Labour Trade Union. All Dutch artists, who refused to join a Nazi 'guild', were excluded from official commissions. A excluded from official commissions. A special body was set up to examine all school-books and hundreds of thousands of books were destroyed. Public libraries were ruthlessly mutilated in the interests of 'friendly relations between Germans and H.' The fact that the Dutch people proved to be immune against Nazi cultural infiltration was largely due to the Churches, which developed into a stronghold of patriotism. All Jews were dismissed from the Civil Service. But if the Gers, were able to close all schools and missed from the Cavil Service. But it the Gers. were able to close all schools and units, and to fill the papers with propaganda and broadcast Nazi speeches all day, they were not able to turn the Dutch themselves into Nazis. This is the more creditable to the Dutch in view of the ganda and broadcast Nazi speeches all sept. 30 the whole of S. Beveland had day they were not able to turn the Dutch been cleared by Brit. and Canadian forces the mere creditable to the Dutch in view of the careful preparations from 1933 onwards by A. A. Museert to secure the destruction of the independence of H. in the interests of the Nazis who, as early as that year, placed large funds at his disposal for purposes of subversion. Soys Inquart deposes of subversion. Soys Inquart declared that it was forbidden to speak

Notice of Orange. The programmer at new 'Nederlandsche Unie' seemed at first to involve a compromise with the Nazis. Final judgment about the Unie must be reserved, but at least the organisation rendered service as a rallying-point of Dutchmen who refused to be browheaten by Dutch Nazis. Queen Wilhelmina remained more than ever the expended of the will to resistance. There symbol of the will to resistance. There was active resistance too and the Ger. military commander found himself forced to issue warnings against all kinds of на botage.

H. did not again figure in land opera-tions until late in 1914 when the Anglo-huer, chiefs of staff decided to use the newly-constituted Brit. and Amer. Airnewly-constituted BIL and Amer. Aborne live, or Sept. 17, to assist in seizing the Rhine crossings at Nijmegen and Arnhem after the rapid advance by the land armies. It seemed probable that land armies. It seemed probable that through rapidity of exploitation both the Siegfried Line (q.v.) and the Rhine might be crossed and strong bridgehead; established on the Gers. could recover sufficiently to make a definite stand in the Arnhem area. Had this been accomplished it might well have shortened the war by sev. months and the attempt would appear to have been justified for from the time when the allied armies first crossed the Seine in force to the employment of the Airborne Army in H. on Sept. 17, the ground forces made prodigious strides. The first landings of the airborne troops were made on sept. 17 and reinforcements followed on successive days. Eindhoven soon fell to the allies but heavy Ger, resistance slowed down the follow-up of the Brit. Guards Armoured Div. Nijmegen was still held by the Gers, as too was the extremely important concrete and steel bridge crossing the Waal, and even when this bridge had the waal, and even when this proge has been crossed the Brit. forces found that the Gers. had had time to oppose a strong anti-tank screen. There was confused and heavy fighting in the area between Nimegen and Arnhem during the ensuing few days and the position of the First Air-borne Div. became so precarious that on sept. 25 orders were given for the withdrawal of all forces across the Lower Rhine (for full details see Western Front in Second World War.—Built of Arnhem). After this the Allies turned their attention to opening up Antwerp, for though the great port had fallen to them on Sept. 4, the harbour was useless until the Scholdt estuary was cleared of nines and S. Beve-land and Walcheren Is. commanding the sea lane to the barbour had been reduced. The operation to achieve this involved the employment of amphibious forces, but by sept. 30 the whole of S. Beveland had

Navy, which, in the highest traditions of economical way to free the country was to the service, 'attracted to themselves the complete the destruction of the enemy point blank fire of the land batteries, thus | forces elsewhere | In N.E. Holland and permitting the commander and assault troops to gain the shore with much highter casualties than would otherwise have been the case. The three convers ing ground forces, attacking over terrain made extremely difficult by flooding and mane extremely difficult by hooding and suffering heavy casualties advanced with great gallantry against stiff enemy resistance to capture the strong points of Veere and Middelburg and wipe out enemy opposition. By Nov 9 all resistance had ceased and some 10 000 troops and the first the transfer that the transfer the transfer the transfer that the transfer the transfer that the transfer the transfer that the transfer that the transfer transfer the transfer transfer that the transfer transfer that the transfer transfer that the transfer transfer transfer that the transfer transfer transfer that the transfer t

complete the destruction of the enemy forces elsewhere in N.E. Holland and along the coastal belt castward, the Canadians continued their operations to clear the area, taking Oldenburg on May 2. In W Holland, however, no further ground advances were made across the thood barriers behind which the Ger. I wents tifth Army lay entreped. The The W. stuation confronting the Allies in W. Holland was difficult. Civilian conditions Holland was difficult. then had deteriorated steadily for some menths, and after the advance of the Allied armies to the F had isolated the had been captured After this the line area from Germany, the position of the

Grebbe and New Water lines, protected
by floods, beyond which no further Allied
advance was made in this sector. It was

pop. became desperate—It was essential, therefore, that steps should be taken by the allies to relieve the growing distress before wholesale starvation took place The strength of the Ger. defences was such that an operation on a great enough scale to ensure success would have meant a serious we thening of the main allied armies in Germany just when it was all important that they should press home the attacks which were bringing about the final collapse of the enemy there More over, even had the allies been able to launch an offensive against W Holland byte, even had the anies be n able to launch an offensive against W Holland at that moment, the Gers would have opened the dykes to flood the whole country, rulning its fertility for many years to come The Allied commanders year to come the state of the s advance was must in this sector. It was bonour of the Ger army and that the felt by Fold Marshal Montgomery that an advance into H. would occasion great coming collapse of Germany Soyss Installand and that the quickest and most Ger. situation. With the relief of the Dutch thus assured, no useful purpose was to be served by attempting inroads into Fortress Holland at this time and the liberation of the country soon followed on the final collapse of all Ger.

The task of reconstruction was begun immediately after liberation. Of the twenty-five big bridges on the main roads all but six were either wrecked by bombing or blown up by the retreating Gers. and of the twenty-six important railway bridges only three were undamaged. By the spring of 1917 the rebuilding of all the main road budges had been completed other with permanent or temporary structures and nearly all the railway bridges had been replaced. The main communications having been re established the most important harbour installations repaired, constructional energies were tions repaired, constructional energies were next directed to the dual task of house building and rehabilitating the flooded ague, areas (more than 8 per cent of the agric, land was flooded and more than 2 per cent laid waste by Ger. fortified zones, mincholds and aerodromes), much of the latter task being achieved by the end of 1947. The serious housing situation in which the country found itself after the war is indicated by the fact that nearly one-fourth of the total number of nearly one-fourth of the total number of dwollings were aged and nearly 3.73 per cent totally destroyed. The clers, however, permitted civil building during the first two years of occupation and some the damaged in 1940, such as Rhenen and Middelburg, were partly re built and a start imade on reconstruction elsewhere; but in 1912, when the Gersconcentrated labour and materials on building their 'Atlantic Wall,' all civil building was stopped. By 1919 there were still four years of housing arrears to be made up or about 250,000 houses, a task readered the more difficult by the task rendered the more difficult by the fact that the normal rate of increase of pop. has risen from 100,000 per annum before the war to 170,000, and also that temporary houses of prefabricated construction have not been utilised in H. brick being preferred even for small houses as that commodity is the one mdigenous material produced in sufficient digenous material produced in sunicient quantity. Rents are restricted to the 1940 level, although building costs have risen by 300 per cent. The gap between costs and rendal values has now been bridged by a gov, subsidy. The city of Amsterdam was the first in Europe to adopt a regional development plan and other Dutch cities have followed its present a ground of the present accounted by fresh legis. war example encouraged by fresh legis-lation which gave to a board of commissioners for reconstruction control over the disposal and utilisation of land. Nitmegen has taken emergency measures to rebuild its devastated commercial centre lest it forfeit its position to Arnhem, its! rival. Arnhem, where destruction was more wide-pread, is concerned parti-onlarly with traffic access and has a reconstruction plan which provides a ring road round the old centre of the tn., links it tious, the conferences between Indonesian with a residential suburb S. of the Ithine, representatives and the Dutch cabinet in and gives new industrial facilities. Un-1 H. having proved abortive. The Bill,

like these battlefield tus., Amsterdam did not suffer large-scale damage and has pursucci unchanged its progressive pre-war tn.-planning policy. Open planning of flats in parallel blocks now take the place of the closed court-yard type of plan that prevalled from the beginning of this centurv almost up to the war. Work has started on a new residential neighbour-hood W. of the city, which promises to be a model of its kind and will include a large lake, the Slotermeer, to be formed as the earth required to build up the surrounding Work has ground above polder level is excavated.

Anoterdam has, in addition, a planning project for the congested Jowlsh quarter of the city where the old houses were demolished by the Dutch to provide fuel for the rigorous last winter of the occupation. Here tree-lined boulevards are being laid out for the narrowest streets facing the canals. War damage in The lingue was largely confined to two areas, one near the centre and the other to the N, by the suburb of Scheveningen. The solve the student of safeveningsh. The rebuilding plan provides a large new square surrounded by gov. offices, which latter are now inconveniently crowded, and a new graded road system within the city. Of all Dutch cities Rotterdam has the most ambitious plans for reconstruction for the contraction of the contractio

the most ambitious plans for reconstruc-tion (we under ROPTERDAM)
On Jan. 25 1945 the first special tribunal for the investigation of collabora-tion charges was opened at 'altertogen-bosch. It was estimated that about 2 per-cent of the pop. had collaborated with the Gost. Over 90,000 persons were detained in the course of 1945. On Dec. 12 the leader of the Dutch Nais, Mussert, was sentenced to death by a special court at The Hague. On May 3 Queen Wilhel-muna returned to H. and invited Prof. Schermerhorn, a leader of the newly-formed Notherlands People's Movement, to form a new gov. In combination with W. Drees, a Socialist member of the second chamber. Following the elections for the chamber. Following the elections for the chamber. Following the elections for the Lower House (May 17) in which the Catholic People's party and the Party of Labour obtained respectively thirty-two and twenty-nine of the 100 acts, the Schermerhorn gov. resigned. Elections for the Provincial States (which in their turn elect the members of the Senate or upper chamber of the States-General) also saw an increase in the representation or the Catholic people's party and Dr. L. J. N. Beel became Prime Minister. The first joint session of the two newly elected chambers was opened by the Queen on July 23

The dominating question was the Indonesum problem, and, in view of the importance to the metropolitan country of its Indonesian Empire, it is not surprising that the question continued to agitate public opinion both in H. and in the Dutch hast Indies and to dominate park discussions for sov. years. In July 1946 a Bill was introduced for the appointment of a Commission-General to be sent to Java in order to facilitate further negotia-

delegated wide governmental authority to the Commission-General, was passed by the States-General in the autumn. The Commission (with Prof. Schermerhorn as Chairman) left H. in time to resume the intermitted negotiations in Java at the end of Sept. and returned after the initialling on Nov. 15 of the Cherlbon draft agreement (see Indonesia). At once the agreement became the subject of fierce controversy throughout H, Labour and other Left wing parties anp-porting the proposals while the Calvinist Anti-Revolutionary and other Right wing parties were in determined opposition. The Cabinet eventually announced its intention of adopting the agreement as the founda-tion of more detailed plans to be worked out by further negotiation. In the parl debate the final vote (Dec. 20) resulted in sixty-five votes against thirty in favour of the proposals, and the Commission-General, thus strengthened by public opinion in H., then left again for Batavia. The difficulties implicit in the problem of reaching a settlement of this question was the main preoccupation in H. throughout 1947. One major difficulty was that the Indonesians had up till now refused to accept the Dutch interpretation of the Linggadjati agreement, but this agreement was signed on March 25, giving de factorecognition to the Indonesian Republic in Java, Sumatra and Madura and envisaging the formation of a governin nation—the United States of Indonesia—by Jan. 1. 1949. Discussions that followed with the Indonesian leaders on economic matters revealed differences which could not be adjusted and the gov. then gave the leaders fourteen days in which to make up their minds to take action for the foundatheir minds to take action for the founda-tion of the United States of Indonesia within the Dutch Empire; but it was ob-vious that they had next to no control over, or perhaps no real wish to control, the extremist elements in Java and frequent violations of the agreement con-tinued to occur. In July (1947) the Prime Minister (Dr. Beel) in a message to the Indonesians, emphasised that it was imperative that they should cease hostilities if the agreement were ever to become a reality. At the same time a message was sent to the Secretary-General of the United Nations explaining that the action being taken by the Dutch Gov. in Java consisted of police measures only and indicated no change in the decision to carry out the agreement; but later, when the Security Council had the case before them, the Dutch Gov. decided to call off all military action, and when the Council offered to mediate the gov. accepted the offer while always rivising to admit that the Council was competent to adjudicate in the case. But at the end of 1948, fighting again commenced between the Dutch troops and the Indonesians. See further under INDONESIA; Java

A Conference of Belgian, Netherlands and Luxemburg ministers was held at The Hague, April 17-18, 1946 to discuss economic questions affecting those countries, and on April 18 it was announced

that they had decided to complete at once the common customs tariff contemplated by the Customs Convention concluded in London on Sept. 15, 1944, to bring the Customs Union into being before the end of 1946 and to prepare the technical arrangements for the final abolition before the end of 1947 of the

abolition before the end of 1917 of the collection of customs duties at the common frontier of II., and the Belgo-Luxemburg Union (see Benelux).

As the outcome of negotiations in London and The Hague (Dec. 1947-Feb. 1948) an Anglo-Dutch trade and financial agreement was signed on Feb. 27. This was followed in July 1948 by a cultural agreement, covering a wide field of intollectual, artistic and scientific exchanges.

On the occasion of the national celebrations in honour of the fiftieth year of her reign and of her sixty-eighth birthday.

her reign and of her sixty-eighth birthday, which foll on Aug. 31 1948, Queen Wilhelmina on Aug. 30 resumed for a period Wilhelmina on Aug. 30 resumed for a period of one week the royal authority which she had reliquished the provious May in favour of her daughter. Princess Juliana, who had since then acted as Princess Regent. On Sopt. 4 Queen Wilhelmina formally signed an Act of Abdication at the Royal Palace, Amsterdam, in which she declared that she had 'completely voluntarily and irrevocably' abdicated all her royal dignities and prerogatives and transferred them to her daughter, Queen Juliana, the lifth monarch of the Notherlands and of the Royal House of Orange-Nassau, who was formally inaugurated on Nassau, who was formally inaugurated on Sept. 6 in the Nieuwe Kerk in Amsterdam. Queen Wilhelmina after abdication took the title of Princess of the Netherlands, living in complete retirement.

living in complete retiroment.

Holles, Denxil, Lord (1599-1680), Eng. tains a regular passenger and freight ser-voe between Holland, Great Britain, and good and true men, and, at a time which

was politically a period of Siurm und It is a hardy perennial, herbaccous in Drang, for his public spirit and his single habit, and is frequently cultivated in and highminded aims. An aristograt by Britain especially in the gardens of and highminded aims. An aristocrat by birth, he was always a staunch Whig in principle, and accordingly averse from Cromwell and his rough-riding over timeballowed institutions. As member of Parliament he supported the impeachment of Buckingham (1827), forcibly held the speaker in his chair till Sir John Ellot's protestations were passed (1629), assisted in the impeachment of Land (1641), endeavoured to impeach Cromwell as an incendiary (1644), and tried to compass the dissolution of the parl, troops (1647). Thus, as a Presbyterian and a moderate, he bravely spoke for freedom; in 1639 he suffered a year's imprisonment. and in 1649 only escaped formal expulsion by Col. Pride by fleeing to France. After the Restoration he served King Charles. Holles, Thomas Pelham, see NEW CASTLE,

DUKE OF. Holleschau, tn. 40 m. E.N.E. of Brno, Moravia, Czechoslovakia. The chief in-dustry is in cloth and linen. Pop. 6000. Hollingshead, Raphael, see Hollington, N. Holloway, dist., par. of Ulington, N. London, England. The old Copenhagen

Fields have been occupied by the cattle risids have been occupied by the cattle mrkt. since 1855. At the N. end of Camden Road is the City Prison (for women), a castellated edifice of 1850. Pop. (Upper H.) 36,000, (Lower H.) 10,000.

Holloway College, The Royal, situated at Mt. Lee, Egham, Surrey, England. It was founded in 1883 by Thomas Holloway (2.v.), the proprietor of the noted pills and oldment. Its object is to summly a

and olutment. Its object is to supply a suitable education for women of the middle class. The students are prepared for univ. degrees and must read for honours. The building, which is con-structed in the style of the Fr. Remaissance. was opened by Queen Victoria in 1856, and contains a fine collection of paintings by Constable, Landseer, Millas, Frith, and other famous artists.

Holloway, Thomas (1500 33), Eng. ointment-and-pill vendor; b. at Plymouth Dock (Devonport); son of a baker, afterwards landlord of the Turk's Head Penzance. After his father's death, he kept a grocery: removed to London about 1828. In 1637, he began to advertise an ointment, and made over half a million sterling by unprecedentedly lavish advertising. Founded Holloway College,

Egham. Holly. or Hex aquifolium, species of Aquifoliacee, found very commonly lu Britain. It is cultivated both as an ornamental overgreen tree and as a hedgeplant on account of its dense and prickly foliage. The timber is fine-grained, heavy and compact, and is valued by both the turner and the mathematical instrument maker; the flowers are small and white: the beries are scarlet and glossy, giving the plant a brilliant appearance in late autumn. They are very poisonous, pro-ducing purgative and violent emetic effects.

Hollyhock, popular name for the species of Malvacese, known botanicully as allcountry cottages.

Hollywood, dist. in the city of Los Angeles, California, U.S.A., situated amidst beautiful surroundings and with amidst beautiful surroundings and an ideal climate, famous as the head-quarters of the Amer. film industry, its emer oungings being the film studies. He has injured the Amer, stage by depriving it of its mrkt. outside New York and attracting to itself much of the best writing, acting, directing, and organising talent; while the Amer. vaudeville has also suffered by its fallure to cope with the competition of the screen. Over two-thords (2) billion delibers of the charge in thirds (2 billion dollars) of the cinema investment of the world is in the U.S.A. and nearly two-thirds of the world's films are made in H., while it requires a rigorous system of quotas, prohibitions, subsidies and publicity campuigns to keep other countries from being even more dependent on the H. film industry than they are. Nearby is Culver City, also a suburb of Los Angeles and a centre of the Amer.

Holman, James (1786–1857), 'The Blind Traveller,' native of Exeter. Being compelled through total loss of sight to quit the navy, he travelled alone through the greater portion of Europe (1819-24) and round the world (1827-32). He pub.

mouth; these tentacles are modified tube-feet, and contain an extension of the water-vascular system. The ambulacral feet are furnished with a suctorial disc, and the ambulatory papille are pointed at the ends, with elementary or no calcaroous plates. The water-vascular system consists of a circular vessel with two appendages, the polian vesicle and the stone canal, and five radial vessels. Holothuroidea are divided into two orders, Actinopoda, are divided into two orders, actinopoda, in which tentacles are always present but feet and papillæ may be absent, and Paractinopoda, in which tube-feet, ambulacral papillæ, respiratory trees and curvierian organs are absent. The former curvierian organs are absent. The former contains the family Holothurlidæ, with the Brit. genus Holothuria; Synallactidæ, whose species have a flattened body; Elaspedidæ, with a more or less ventral mouth and elongated body; Pelagothurlidæ, pelagic forms with a cylindrical body; Molpadiidæ, burrowers in mud or clay; Cucumarlidæ, with the familiar Brit. genera, Cucumaria, Thyone, Padus, and Phyllophorus. The order Paractinopoda contains the single family Synaptice, whose typical genus Synapta is known on Brit. coasts, S. inherens and S. on Brit. coasts, S. inherens and S. digitata being the commonest species.

Holroyd, Sir Charles (1861-1917), Eng.

painter-etcher; b. at Leeds; eldest son of Wm. H., merchant. Educated: Leeds Grammar School; Yorkshire College of Science: Slade School, London—assistant teacher 1885-89. Fellow, Society of Painter Etchers, 1885. In Italy with with Sent travelling scholarship, 1889-91. Sent seven pictures to Royal Academy, 1885-1895. His etchings are much better than his pictures. He also executed some his pictures. He also executed some portait-techings and excellent drawings of trees. First keeper, National Gallery of Brit. Art, 1897-1906. Director, National Gallery, 1906-16. Knighted 1903. Holroyd, John Baker, see Sheffikld,

EARL OF.

Holst Gustav Theodore (1874-1934), Eng. composer, b. at Cheltenham, of Swedish extraction on his father's side. Like his father, he was an organist, and he early became choirmaster in Gloucesterearly became choirmaster in Gloucestershire, where he laid the foundations of his skill in choral effect. In 1895 he obtained a scholarship at the Royal College of Music, learning under Stanford and Sharpe. Three years later he decided to earn his living as a trombonist, and so acquire experience of the orchestra from the inside. In 1903 he was music master at Edward Alleyne School, at Morley College in 1907, and later worked in a similar capacity at other well-known colleges. He had to wait long for recognition. His chief works are The Phanets (1915-16), orchestral snite; Hymn to Jesus (1917), choral;

Holothurian (Gk. 5λος, whole, and Garden by the Brit. National Opera Comδυροκιδής, like a door), name given to any pany, in 1923; and At the Boar's Head individual of Holothuroidea, a class of (1925), a Shakespeareau opera, in which he cucumbers. It is an elongated, wormlike animal with a ring of about twenty large retractile tentacles surrounding the worth these tentacles are modified this.

Holy Orders, see ORDINATION. Holy Places, localities in and close to Jernsalem as-ociated with the life of Christ. They include the church of the Holy Sepulchre (see SEPULCHEE, CHUICH OF THE HOLY); Bethlehem, whose outstanding monument is the Basilica of the Nativity, shared by sev. communities. Orthodox, Lat. Armenian, Jacobite, Abyssinian and Coptie; the Garden of Gothsemane, belonging, in shares, to the Franciscans, the Orthodox Patriarchite. of Jerusalem, the Russians, and the Armenians; and other sacred sites on Olivet or the M. or Ouver such as the Ascension. The Pope entrusted the custody of the H. P. in 1230 to the custody of the H. P. in 1230 to the Franciscans and later this custody passed to France, the position, however, being complicated by the fact that the Turkish suzorain was in possession of the Holy Land. Difficulties over the custody as between France and Russia, representing respectively W. and E. Christianity was one contributory factor to the outbreak of the Crimean war. Under Art. 13 of the Mandate for Palestine granted by the League of Nations to Great Britain all responsibility in connection with the H. P. and religious buildings or sites in Palestine, including that of preserving existing rights and securing free access existing rights and securing ree access and the free exercise of worship, while ensuring public order and decorum, was assumed by the mandatory, who was, under the Mandate, made responsible solely to the League of Nations in all matters connected with the mandatory obligations. The mandatory, however, was empowered to arrange with the beliefing administration to convenient the Palestine administration for carrying the provisions of this Article of the Mandate into effect. The same Article also provided that nothing in the Mandate night be construed as giving the mandatory authority to interfero with the fabric of purely Muslim sacred shrines. Under Article 14 of the Mandato the mandatory was enjoined to appoint a Commission to define and determine the rights and claims in connection with the H. P. and the rights and claims relating to the

the necessary modifications; and to judge its functions. The duties of the former the authors of such writings by the canons Mandatory have now passed to the of modern historical science is miscon- United Nations (see further under Paliss-

Holy Roman Empire. This name is usually applied to the empire founded by Charles the Great in the year 800, and which was regarded as the revival of the Which was regarded as the revives of the W. Rom, empire. It did not include all the ter. of the latter organisation, but nevertheless it typified the ideal. The W. Rom, empire had come to an end in 476, when Odoscer had finally taken possessions of talk and had signified to Zono. sion of Italy, and had signified to Zeno, the ruler of the E. empire, that henceforth he alone should rule as emperor of a Rom. empire, and he, Odoacer, should rule as patticum and, in all but name, king of italy. Since those days the face of kurupe had changed considerably. Odo-acer had been deposed, executed, and succeeded by Theodoric, the leader of the Ostrogoths; and the death of the latter (52a) had witnessed the break up of the power of the Ostrogoths, and for a time Italy became the scene of constant wars. Justinian and his great general, Belisarius. had conquered much of Italy, but had hually been held in check, and then the N. part of the peninsula passed into the hands of the Longoburd (Lombards). In another part of W. Europe the power of the Franks had been constantly on the mrase. The line of Clovis had passed away with the last of the rois faincants, the Mayors of the Palace had usurped the hands powers and tundly in 739 the kingly powers, and finally, in 732, the createst of the Mayors of the Palace, thatles Martel, had held in check the inroad of the Saracens, and had, according to one great authority, saved W. Europe for Christianity. The victory at Potiers, according to Gibbon, prevented the Moslem from e-tablishing his faith to the uttermost isles of the W. Charles Martel also helped the papacy in the struggle against the Lombards, and commenced the long alliance of Carolings and papacy. In the meantime the growth of the power of the bishops of Rome had been equally great. By the beginning of the eighth century the papacy had declared itself the spiritual head of the world, and had pre-pared the way for that union of the peritual and temporal power which was to rule the world, acknowledged by all.

The accession of Charles the Great in

The accession of Charles the Great in 768 marks the beginning of the closer unity of papacy and empire. Twice Charles the Great crossed the Alps to rescue the papacy from the clutches of the Lombards. Finally, during his second expedition, he wristed for himself the iron crown of Lombards. wrested for himself the iron crown of Lomburdy. Henceforth the papacy was to be protected by its most helpful ally. The gratitude of the pope was speedily seen: as Charles knelt in prayer in the great church of St. Peter's on Christmas Day in the year 800, he was saluted and crowned by the pope as emperor. Henceforth the Middle Ages were to be practically one long quarrel between the nominal heads of Christmou. Had Charles forcease the different religious communities in Pales-Christendoru. Had Charles forcesen the tine. The council of the League was to give its approval to both the composition the claims which later successors to of the Commission and the performance of the chair of St. Peter founded on it, he probably would have, as in later days Napoleon did, crowned hinself. The arrogant pretensions of the later papacy were based on the fact that the pope had raised a mere king to the empire

It must be borne in mind particularly that, as H. W. C. Davis points out in his Medicival Europe, the Carolingian empire was based upon the model not of Augustus but of Constantine, from whose forged donation the papacy claimed for itself all the provs. of the W. empire The empire did not, save as an ideal, outlive its founder. The reign of his son witnessed the beginning of the end, and the treaty of Verdun (843) estab. a potential France, Germany, and Italy. Only once again, under Charles the Fat (8*1-887), were the three portions of the empire of Charles the Great united. The later Carolings were as weak as the mis functions, and the invasions of the Norsewas based upon the model not of Augustus funcants, and the invasions of the Norsemen gave greater power to the local nobility, and this was aided by the rise of feudalism. In German, the power concentrated in five great duchies, Saxony, Swabia, Franconia, Bavaria, and Lotharingia. In 918 the dukes refused to recognise the Caroling line, and elected Henry the Fowler of Saxony as king The Carolings continued in France until 987, when they were supersided by the Capotian line. The year 918, although it does not seem to have affected contemporary historians to any great extent, marks the final separation of France from the empire. Henry the Fowler concentrated his attenthe way for his son Otto. The value of his work is seen best in the reign of his son Otto. The value of his work is seen best in the reign of his son Otto the Great (936-973). In Germany he put down two civil wars in the duchies, ne put down two civil wars in the duchies, first giving them into the hands of his relatives, then seeking active alliance with the church to produce unity. His greatest success was the victory over the Huns on the Lechfield (954) and his policy of 'Marks' (Marches) along the E borders. The alliance with the papacy led to the request to interfere in it. politics, which he did in 951 and 962. The second intervention led to his coronation as enintervention led to his coronation as emperor of the W

Otto regarded himself as the successor of Charles the Great, and appointed and deposed popes from 903 till his death. Otto II. (973-983) began to split the great duchies, but still extended towards the E. The ideals of Otto III. (983-1002) were more universal, and he wished to make Rome and not Aachen his centre. On the death of Henry II. (1002-2), the last of the Saxon house, the empire passed to the Salian house, the first emperor of which was Conrad. (102-1037), who concentrated upon ensuring the hereditary succession of his house. To this end he made feudal benefices hereditary in Germany and Italy. The reign of his son, Henry III. (1037-50), is usually regarded as the most glorious period of the mediaval empire. Hungary, Poland, and Bohemia became flefs of the empire. There was comparative peace, and the development of almost a national

feeling in Germany.

During this period the papacy had been gradually developing its resources. In 918 there had been estab, the monastery of Cluny, whose members were now aiming at the purification of the church and its release from lay interference, and the exaltation of the papacy. Henry III. showed deep interest in their work, but in his actual relations with the papacy appointed and deposed popes. Henry IV. (1056–1106), in his actuagle with the papacy, was faced with the 'noblest figure' in hist., Gregory VII. (Hildebrand). The papacy was exceptionally powerful, having for its support the Cluniacs, the Normans of S. Italy, Matiida, countess of Tuscany, and all discontented nobles in Germany. In 1075 Hildebrand at a synod formulated the claims of the papacy by stating that no lay prince must inter fere with the election and investiture of clerica. Henry defied the pope, and the pope excommunicated the emperor, who at once found himself in great difficulties, be ause his nobles refused to recognise an excommunicated king. He was forced to cross the Alps, and in 1077 to undergo the diamatic humiliation at Canossa But Hildebrand's severity defeated his wen ends by allenating the Ger. princes, and in 109, he was driven from Rome, and found a refuge in Apulla with the Normans. In the same year he died Renry IV. was deposed by his son (1106), and also died in the same year. Henry V (1106–25) concluded his phase of the struggle by the Concordat of Worms (1122). By this concordat the spiritualities were to be conferred by the papacy, whilst for the temporalities of the bishopric homage was to be done to the reigning prince (compare Anselm and Henry I., 1106).

After Lothair another dynastic change took place with the election of the Hohen staufon candidate, Frederick I. (1152-90), who combined the claims of Salia and Saxon He again was drawn into a long struggle with the papacy, whose ally now was a new organisation, the Lombard League, formed by the tins of N. Italy. He was, however, defeated at Legnano (1176), and again an emperor made submission to a popo in 1177. But Frederick had succeeded in establishing a conditional supremacy over the important tins. of N Italy. By the marriage of his son to Omitance, he frees of the Norman dominions, it seemed that the dream of an empire from Sicily to the Baltic would be realised.

Sicily to the Baltic would be realised.

Henry VI. (1190 9%) had greater promise than any previous emperor. The brevity of his reign, however, prevented any great developments, and his death left the throne to a child. The power of the papacy is well illustrated by the events of the next few years. Imporent III. took Constance and her son under the protection of the papacy, giving them the two Sicilies. The empire was granted to Otto IV. on condition of alliance with the papacy. Otto proved recalcitrant, and in 1214 the papacy offered the empire to the young Frederick. John of England allied himself with Otto, his nephew. Frederickfoundsupport in Philip Augustus,

and defeated the allied forces of John and Otto at Bouvines, a battle which influenced England, in that it led to the granting of Magna Charta; France, in that it removed fear of Eng. interference and helped the Capetian monarchy. In the last phase of the great medieval struggle, the cause of papal enmity seems to have lain chiefly in fear of the position of the emperor, Frederick II. who now held both Sicily and N. Italy. But with the death of Frederick the papacy gathered itself together for a final attack on the Hohenstauten. His direct sucon the Hohenstaufen. His direct suc-cessor was 'the little Conradin,' but he did cessor was the little Conradin, but he did not gain election in Germany. Various candidates appeared, among whom were Alfonso of Castile, Richard of Cornwall, and Wm. of Holland. But none were actually recognised as emperor. There-fore the period from 1250-73 is known as the Great Interregnum, so that the death of Frederick II. marks the end of the great period of the medieval empire. In 1273 Rudolf of Hapsburg was elected emperor, but he never ruled over Italy. Henceforth the H. R. E. does not include Italy, and may to a very great extent be regarded as the personal and private possession of the house of Hap-burg.

Most of the later emperors were chosen from the house of Hapsburg, whose chief possessions were in Austria, acquiring Bohemia by mar...sc. in 1361 the granting of the Golden Bull by Charles IV., which settled the method of choosing the emperor, restricting the number of electors to seven, and naming them, lessened the power of the emperor in favour of the princes. During the four-teenth and differenth centuries, the elected emperor often paid more attention to his hereditary domains than to his imperial olaims, because the empire was becoming so weak and poor. Therefore the emperor was chosen from the most powerful House, was enosen from the most powerful 1104se, Austria, so that his private possessions would lend dignity to his position. During the sixteenth century, Maximilian added Burgundy to the possessions of Austria; his son, Charles V., held Spain, the Notherlands, Burgundy, Milan, the two Scidles, Austria, Hungary, the Sp. dominions in S. Austria, Hungary, the Sp. dominions in S. Austria, Hungary, the Sp. dominions in S. America, and the empire. But the empire itself was purely Gcr., and had little to do with affairs outside. The Reformation and the Counter Reformation, however, affected it greatly. There is no clear line of demarcation, and by the sottlement of the peace of Augsburg, 1555, the two religions were placed on an equality, each state setting up its own religion (carus regis, etus religio). Out of this unstable regis, etus religio). Out of this unstable situation there developed the Thirty Years war, fought with the empire as a battle-ground. In 1648 the peace of West-phalia was concluded, Protestantism and Catholicism were put on a level again, but the empire was ruined by the war. From this time Germany was a mere lax confederation of petty despotisms and oligarchies; Switzerland received its independence, as did also the Netherlands, Sweden and France received ters, within the empire. There could be no national feeling in such circumstances; the power

of the emperor had departed, and interest must centre in the rising power of Prussia and its rivalry with Austria, shown especially in the wars from 1740 to 1763, in which Frederick opposed Maria Theresa.
But as a result of the world schemes of Napoleon Bonaparte the empire found to the world schemes.

self in grave difficulties. First the Austrian Netherlands and all Germany W. of the Rhine were added to France. When Bonaparte in 1804 crowned himself emperor of the Fr., Francis II., who was em-peror elect of the Roms. and king of Germany, changed his title to Hereditary Emperor of Austria. In 1805, at the treaty of Pressburg, he again changed it to emperor of Germany and Austria. Many of the Ger princes now seceded from the em-pire, and formed themselves into a Conpire, and formed themselves into a Confederation of the Rhine under the protection of Napoleon Bonaparte. In the same year, 1806, Francis resigned the empire; since then, there has been no other emperor of the H. R. E. See J. Bryce, The Holy Roman Empire, 1904; T. F. Tout, The Empire and the Papacy, 1906; J. Halles, The Epochs of German History, 1925; L. the Father and the Son, while His Personality is insisted on in the important passage beginning John xiv. 16, as also in John xv. 26. But when the Comforter is come whom I will send unto you from the Rather come the Strett efforts which was come whom I will send unto volt from the Father, even the Spirit of truth, which pro-cedeth from the Father, He shall testify of me. In this text we have also a refer-ence to the question of the Procession of the H. G., which caused such scrious misthe H. G., which caused such scrious mis-understandings between the E. and W. churches in later centuries. The E. con-demned the churches of the W. for the addition of the Filloque clause in the Nicene Creed, and they further denied that the procession of the H. S. was 'from the Father and the Son.' It must be pointed ont, however, that there is probably no roal doctrinal difference involved, as the W. has never held that this rather unfortu-nate addition to the Ecumenical Creed nate addition to the (Ecumenical Creed teaches a Dual Procession, but rather a procession from the Father through the Son. This doctrine E. theologians would endorse. Many questions relating to the H. S. are bound up with the controversies as to the Holv Trinity which occupied the mind of the church in post-Nicone times. The most important results, embedded in the Athanasian Creed and the additions in the Athanasian Creed and the additions to the Nicene Creed, lay stress on the personality of the II. S. See H. Home Guard, or Local Defence Volun-teers, volunteer defence force, recruitment it which began officially in May 1940, in sponge to the Will Minister's call in the tergency of that time, when it was be coming obvious that Britain was not im-mune from possible invasion While ist provides no parallel to the speed and enthusiasm of its requitment, the muster of all men between 17 and 55 in 1903 under a Lover on Masse Act was in fact a precedent. The inception of the 1 D V or 11 G way a spontaneous move and two years later became minister of ment based on this and other historic

precedents, including the musters of 1545 and 1588, the train bands of 1642, 1667, 1719, and 1759, the volunteer movement of 1859 and the volunteers of the First World War. The chief difference between the H.G. and any other form of military force raised in the Brit. Isles since 1803 was that whereas the charge 4 Six John was that, whereas the others, e.g. Sir John Firebrace's Horse, the Militla, the Wemyss Volunteers and the Territorial Force or Army, had been kept away from the front line until they were deemed sufficiently trained to meet the enemy, the H.G. was experted, and themselves ex-pected, to meet the enemy wherever he might show himself in the country. But, of course, a great number of those who joined had seen service in the First World War, a fact which in all probability had its due effect in restraining the ardour of the Ger. forces which were reported to be available for manning the invasion barges. Men liable to be conscripted in the ordinary way were of course ineligible for the H.G. At first the H.G. was bardly an effective force at all, for no arms were available for their equipment other than a few thousand rifles and shot guns, old pikes and sabres and some Army revolvers and long barrelled Amer. revolvers used for clay-pigeon shooting. The formation of the H.G. at that moment in the nation's dilemma has been not inaptly called a gigantic bluff but, in view of the possible descent of Ger. parachutists armed with grenades and tommy-guns at vital spots such as factories, railway bridges, petrol dumps and Ordnance depots, the nuster of H.G., albeit crudely armed, was better of H.G., allost crudely armed, was better than no force at all for the purpose of supplementing the relatively few regular troops—the bulk of the regular divs, being in France or in the Middle E. On May 11 the General Staff accepted, in principle, the proposals for the formation of a defence force on a tn. and vil basis, giving the utmost lat. to local enterprise so as to launch the scheme with the minimium of delay and this indeed was the scheme on which the force was subsequently founded. In fact, even before Mr. Eden on May 14 broadcast his call for volunteers, the civilian pop. in certain parts of the country were forming themselves into bands to deal with hostile parachutists and the alm of the military authorities was to get this valuable movement on a regular footing as quickly as possible. It was on get this valuable movement on a regular footing as quickly as possible. It was on May 11 at a conference at the War Office that the name 'L.D.V.' was chosen but the popular name, 'Home Guard' was adopted two months later. The military authorities agreed on May 14 that the H.G. would form part of the armed forces of the Crown and would be subject to military law. The sallent features of the scheme were simplicity, decentralised control and the minimum of formalities. There was to be no estab, and no nav. There was to be no estab. and no pay, There was to be no estab. and no pay, though travelling allowance was given. Nor were there to be an officers or n.c.o.'s in the ordinary Army sense. Volunteer organisers were to elect and nominate to the Area Command individuals for appointment as company commanders. Arms, ammunition and uniforms were to

be issued under Command arrangements. It was on this incomplete and tentative basis that Mr. Eden's appeal was made and tt was fully justified by its results. The equipment originally envisaged for the H.G. consisted of a rife, beyonet, steel helmet, and arm brassard to be worn with civilian clothes. In fact even this equip-ment was beyond the actual possibilities at the time and it is said that when the official appeal was made the stock of rifics available in Britain was no more than 70,000 in all. The actual numbers of the H.G. in the early summer of 1943 approached 2,000,000. But by that time men could be compulsorily directed to serve if they were of an age and condition that justified that course. There were about 1,000 battallons, some of which were sev. thousand strong. The number of H.G. anti-aircraft batteries—for in the intervening years many had been directed to this role—was large and there were 43,000 officers in the H.G. General Service units and A.A. Batteries. It is stated on good authority that, by 1913, only 7 per cent of the men were ex-servicemen, this cent of the then were ex-servicement, this reduction being due to the elimination of the elderly and unfit and the average age of the H.G. was by that time slightly under thirty. They were now fully armed and trained, able to use their armed and trained, able to use thouse weapons which ranged from the bayonet to the 3 7 gun and yet remained the most inexpensive of military forces, a fact largely due to the patriotism and generosity of private individuals. The H.G. was its of private individuals. The H.G. was disbanded on Dec. 31, 1915. Parades, however, had ceased in Sopt. 1914 and orders were issued for the H.G. to stand down on Nov. 1, 1914. Delay in the formal disbandment was due to the necessity of facilitating the recall of arms and equipment. Officers were given bonorary rank in the highest rank they held for an aggregate period of six months. See C. Graves, The Home Guard of Britain, 1943.

Home Laundry, see under HOUSE-WIFFRY.

Homel, see COMEL.

Home Office. The Home Secretary is, as regards home affairs, the constitutional channel of communication between the king and his subjects, and all petitions or addresses to the king must be addressed to him through the Home Secretary. The powers and duties of the H. O. are of the widest and most varied kind, but perhaps the most important relate to the control of the Metropolitan Police, the exercise of the prerogative of mercy, the administration of the Factory Acts (see Factory Legis-LATION), extradition proceedings, the carrying out of the provisions of the Aliens Act and the Naturalisation Acts, and the general superintendence and control over prisons, criminal lunatic asylums and approved schools once called 'reformatories.' The Home Secretary appoints recorders, silpendiary magbirates, factory inspectors, and inspectors under the Explosives Acts under the Anatomy Acts, and the Crucity to Animals Act (or Vivisection Act). He sanctions by-laws of municipal bors, so far as they relate to 'order and

good governance.' He advises the crown who, having deprived his eyes of light, (q,v), as to pardoning convicted persons or endowed him with the dvine gift of song, commuting or otherwise reducing their I i 's blindness is accepted, it must be sentences, and he can license prisoners assumed that he became blind in later life commuting or otherwise reducing their sentonces, and he can license prisoners under sentence of penal servitude either conditionally or unconditionally He inspects the country police forces and can spects the country police forces and can advise the Treasury to withdraw ox chequer contributions if he finds such forces inefficient. All extradition proceedings pass through the hands of the Home Socretary, who makes the final order for extradition. He may refuse a certificate of naturalisation to an alien, and need give no reasons for so doing He grants licences to scientific bodies to experiment on animals He has power to authorise the exhumation and removal of bodies He performs the routine work in respect of the licensing, the making of a canon law, and its subsequent promulgation He prepares patents of nobility for perra and formal proceedings for the bestowal of honours also pass through the H O During the Second World War a great deal of work ful on the H. O in connection with the provision of air raid shelts and the provision of air raid shelts are the provision of the raid whether the provision of the raid whether the provision of the raid whether the provision of the provi for the public and other measures of public security, there being set up in the H O for those purposes a ministry of Home Security The Home Secretary is assisted in his duties by a part under societary, a permanent under secretary, three assistant mu secretaries and a

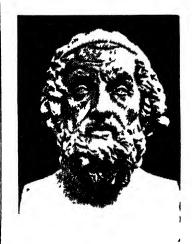

three assistant and a stress of the large clerical staff

Homer, great epic poet of Greece The date of his birth is quite uncertain dotted declared that Hestod and H. were contemporaries and lived 400 years before his own time. Most achielars now assign the Iliad and the clearly somewhat later the Had and the clearly somewhat later Odyssey to some date from the tenth to the eighth century BC Many the claimed to be his bp—Smynn, Chios Argos, Athens, salamis His poems were regarded as the basis of GK, literature, and overy chicated Gk had learnt them in his schooldays No real records of his life existed, but many keends grew up around his name Phere are extant eight lives, included in the Oxford text of H One of these, which is probably a H One of these, which is probably a literary forgery belonging to the second century AD, was falsely ascribed to Hero dotus, and contains the most popular legends with regard to his life. The bio grapher declares that H was the lilegiti mate son of Crethely, and that he was born near Smyrna on the banks of the Meles He was subsequently adopted by his mother's husband Phemius, and travelled extensively in Egypt, Italy, and the is of the Meditarranean, collecting materials for his epits, which he wrote on his return to Smyna During the course of his travels he had become blind, and spent the rest of his life as a wandering minstrel, singing his songs in the the of Asia Minor

and the is of the Archipelago.

The tradition that the poet was blind probably arose out of two references to blind hards in the Odyssey, in which a personal allusion was traced Demodocus, the blind harper who wang his lays in the halls of King Alcinous, is spoken of with great sympathy. He was beloved of the Muses, Aristarchus

for the two epics show a keen perception of an exuberant delight in line and form and motion The claims of Smyrna as his bp were supported by Pindar, Scylax, and Stesimbrotus But Chios had equally strong if not stronger, claims. In that is, there was worship of an anct. hero, Homeros, and an existing tradition of a family of Homerids. Its claims were also supported by Thucydides, Simonides, Acusilaus, and Hellanicus.

HOMER

It might be thought that the Iluad and the Odyssey were composed during the cooks which they describe, but it is now generally considered that H. drew on old sources and archaized to exclude anachronians His heroes belong to the bronze age, iron being hardly mentioned, act the poet betrays himself by quoting a proverb that uno draws a man on to quirrel), showing that iron weapons in his own day were in common use. As has be a said, the tenth to the eighth century is now the date assigned to H., although some modern authorities put him even later

The works of II were studied critically early times. Theogenes of very Rhegium (c. 530 s c) regarded the epics as allegories, so that he might reconcile its principles with the morality of his own His theory was accepted by Anaxa time or is and Metrodorus. Asnophon, Plato, and Aristotle carefully studied the structure and meaning of the poems, while Intimachus paid attention to the text. The great textual critic of anct. times was Other Alexandrian critics of

importance in this connection were Zenodotus and Aristophanes. The critical emendations and suggestions of Aristarchus are preserved in the Codex Venetus in the library of St. Mark, Venice (pub. by Villoison, 1788). The unity of Iliad and Odyssey as poems was almost unquestioned down to the eighteenth century. By his pub, of the Prolegomena ad Homerum in 1795, F. A. Wolf opened the controversy which is known as the 'Homeric question,' Wolf held that the Hind and the Odyssey consisted of a series of songs which were not not together until short which were not put together until about 500 years after they were composed. He argued that writing must have been unknown to H., that therefore the song were passed on from one generation to an other orally by the Rhap-odists; that since poems of such length could not be transmitted through centuries without any recourse to writings, the present form of the poems could not be the original form, and that, according to the 'voice of anti-quity.' Pelsistratis' first committed the poems of H, to writing and reduced them to the order in which we now road them. It is now generally admitted that the poems were certainly unwritten, whereas it is also agreed that it is possible for poems, even of such length, to have been memorised by the professional trained singers and ministrels of the Greena courts. There may, at the same time exist in the text many interpolations or deviations from the original form of the poems. Wolf's statement about Pelvipoems. Woir's statement about Petsistratus's collection of the poems has no earlier authority than Cleero (De Oratione, ili. 34). The controversy raised by Wolf was hottest during the first half of the nineteenth century. Gottfried Hermann, in De interpolationibus Homeri (1832) and De iteratis Homeri (1840), maintained that he was able to distinguish three elements. be was able to distinguish three elements in the *Ilian*, a pre-Homeric element, a Homeric, and a post-Homeric. Luchmann went so far as to divide the *Ilian* into eighteen iays, and declared that the original lays had been bröken up by interoriginal lays had been bröken up by interpolations and finally put into shape by Peisbtratus. The Wolfian theories were strongly opposed by Nitzsch in his Meletemata (1830) and Die Sagenpoesie der Griechen (1852). Welcker, in The Epic Cyrle, showed the early cyclic writers had been influenced in the structure and substance of their epic pooms by the Ulad and the Odyssey; and that the latter in their present unity of form must be dated before the cyclic writers. before the cyclic writers.

The question as to whether the Iliad

and the Odyssey were written by the same author was first raised by Xeno and Hellanicus, called of xop(covre, the Chorizontes or Separators. The chief arguments which have been raised in favour of and the Odyssey were written by the same author was first raised by Xeno and Hellanicus, called of xopicorres, the Chorisontes or Separators. The chief arguiness which have been raised in favour of the two poems are as cole authorship of the two poems are as supreme genius near whom none can be placed in the world's Hierature save Dante and Shakespeare; but that two poets of such greatness should have lived then seems improbable indeed. It is also argued that though there must be some

difference in style between the Iliad, a difference in style between the ream, a poem of peace, the great outlines and essential styles of the two poems are similar, whereas each is wholly different from anything olse produced by the writers of anct. Greece. The early Chorizontes argued in favour of two authors, by pointing out certain discrepancies between the two poems, such as the fact that the wife of Hephastus in the *Had* is Charis, while she is Aphrodite in the *Odyssey*. Modern scholars have based their arguments in favour of a later date for the Odyssey (and, therefore, a different author) on differences between the two poems of vocabulary, grammatical forms, of treatment of the heroic legends, of institutions, political and social, and of religious or moral outary, grammatical forms, of treatment of the heroic legends, of institutions, political and social, and of religious or moral outlook. Home Rule. The demand of Ireland for H. R., which was defined by John Red-mond, the leader of the movement, as the rule of a local Irish parliament created specially to deal with Irish affairs, was for some fifty years the stumbling-block of Brit. politics. The demand was first put forward as a definite policy in 1871, but it was not till 1885, after the extension of the franchise, that Ireland returned a majority for H. R., when 85 members out of 103 were pledged to support H. R. From that time down to 1893 the Liberal party's adlierence to the policy of self-gov. for Ireland was associated with the name of Gladstone, who introduced Bills in 1886 and in 1893. The latter Bill was carried in the Commons by a narrow majority, and promptly thrown out by the House of Lords. It set up a legislature and executive in Ireland to control Irish affairs, subject to the supremacy of the Imperial Parliament; and there were further safeguards to that supremacy in the shape of guards to that supremacy in the snape of provisions analogous to those of the Colonial Laws Validity Act (see COLONIAL LAW), an express prohibition from dealing with the land question for three years, and a reservation of some thirteen important topics of 'cg. lation to the exclusive consideration of the Imperial Parliament. The depression in the fortunes of the Liberal party which endured these often for a needed of seventeen years. thereafter for a period of seventeen years left the question dormant until after they were returned to power in 1906. The election of 1906 was generally understood to have been contested on the fiscal issue, to have norn contexted on the recal issue, the nominees of the Liberal party expressly undertaking not to introduce a H. R. Bill, but in 1907 the Irish Council Bill for the estab. of an Irish body to expend in Ireland the proceeds of Irish taxation was introduced and withdrawn. At the two later elections they made no such declarations of intention, and in April 1912, Asquith introduced his H. R. Bill. This Bill, which passed its second reading by a majority of over 100, was based on the model of the first Bill; but the financial provisions were more explicit. It estab, an Irish Exchequer and an Irish Consolidated Fund, and provided that the whole of the cost of Irish gov., with the exception of the expenditure on the reserved services, should be borne by the Irish Exchequer. Asquith's Bill passed the House of Commons in Jan., 1913, but was thrown out by the House of Lords. It was passed thereafter in three successive sessions by the Commons and so by the operation of the Parliament Act, 1911, became law irrespective of the assent of the House of Lords (see PARLIAMENT AOR, 1911). The Bill included Ulster and, in its earlier stages, was followed in 1012-1913 by stout resistance in that quarter, where the controversy incited by it rose almost to the brink of rebellion. Two of the chief protagonists in the resistance were Sir Edward (later Lord) Carson and F. E. Smith (later Lord Birkenhead); but this campaign suddenly died down and

the Bill passed the House of Commons in May 1914. The Lords excluded Ulster, and the King then made an attempt to bring the parties together, but without success. The outbreak of the First World War, however, changed the whole face of things, and the Bill thereafter became law without further resistance for the whole of Ireland in Sept. 1911. Its operation, of Ireland in Sept. 1914. Its operation, however, was postponed by the Speaker until after the War, and the sequel to this postponement was that the Bill never came into operation at all (see further value Virus, 1918). under EIRE; INISH FREE STATE). Home Rule Movement, Scottish, see

SCOTHER.

Homestead, hor. in Allegheny co., Pennsylvania, U.S.A., on the R. Monongahela, 6 in. S.E. of Pittsburg. It was founded in 1871, and was incorporated in 1880. Here are the famous iron and steel works of the Carnegie Co., which rank with the largest in the world. At these works in Issue occurred a tremendous strike, the rioting in connection with which had to be quelled by state troops. Pop. 19,000. Homicide, see Manslaughter; Murber; and Ingarity.

Homildon Hill, one of the Cheviot peaks, beat the vil. of Homildon or Humbleton, 20 m. S. of Berwick, Northumberland, England. It was the scene of the battle (1102) in which Hotspur and the earl of March defeated the Scots under earl Douglas.

Homily, discourse addressed to the congregation in a church. It was customary in the Jewish synagogues after the reading of the law for an explanatory discourse to be given, and this practice was early adopted by the Christian Church. The Alexandrian school was particularly rich in such exegotival expositions, the most tamous anct, collection of Hs. being that of Origen in the third century. The Hs. of the Church of England are a collection of sermons (see Article xxxv.) for the use of undermed preachers. The first part was pub. in 1547, the second in 1563.

Homocyclic Compounds, organic ring compounds in which all the atoms composing the ring or rings are atoms of car-bon. Examples are bonzene, naphthaline.

and anthracene.

Homosopathy (Gk. ouolos, like, widos, disease), name given to a system of mediome introduced by a Ger, physician, samuel Hahuemann, who was b. at Leipzig in 1755 and d. in 1843. In his Organion of Medicine, Hahnemann set forth the principles on which his system was based. These were: (1) That morbid conditions are circled by the same medicines which would need use the disease in cines which would produce the disease in healthy bodies, in accordance with the old orlief expressed by the Lat. phrase simila similibus curantur (like is cured by the). (2) That drugs administered should be simple and not compounded. (3) That in most cases only very small quantities of the drug should be given, on the theory of dynamisation, or increase of force with diminution of matter, such dynamisation, it is alleged, being produced by trituration (i.e. grinding to a fine powder) and by extreme dilution. There are very few followers of H. at the present-day. In contradistinction to H., the ordinary method of treating disease is described as heteropathy or altopathy. See also HANNEMANN and MEDICINE. See T. L. Bradford, Life and Letters of Hahnemann, 1895; J. H. Clarke, Hahnemann and Paraceleus, 1923, and Constitutional Medicine, 1926; E. A. Neatby and T. G. Stonham, A Manual of Homætherapeutics, 1927.

Homogeneous and Heterogeneous are two mathematical terms. The former is applied to magnitudes which are commensurable, and in algebra to all terms of the same degree, as for instance x and y. The word is Gk, for 'of the same kind.' Heterogeneous, which is Gk, for 'of a different kind.' is the opposite of 'bomogeneous,' and describes a group of incum-

geneous, and describes a group of incommensurables, e.g. spheres and plane circles, Homolousian, theological term, which became a party word at the time of the Arian controversy. It is derived from the words bacs, 'same,' and owar, 'sunstance,' and denotes the consubstantiality of the Father and the Son in the Hessed Trinity. The more moderate Arians, unwilling to say that the Son was of a different substance from the Father, wished to use the phrase' of like substance.' See

ARIUS: ATHANASIUS.

Homologation, in Scots law, denotes an act by which a person signifies his approval of a deed so as to make it obligatory upon him in spite of any defects in it. A common instance of H. occurs where a person capable of consenting approves a deed granted by him at a time when he was legally incapable of giving his assent to its terms, as e.g. by a minor on his attaining majority in respect of a grant made during minority without the consent of his curator. But to be valid H. must be an act from which it may be clearly inferred that the person homologating both knew and approved the contents of the instrument. See G. Hell, Commentaries on the Law of Scotland, 1810; J. Erskine. Principles of the Scotch Law, 1754.

Homologous Series. In chem., a series of similar organic compounds, any two consecutive members of which differ in molecular constitution by I carbon atom and 2 hydrogen atoms. There are sov. such series, and owing to a certain amount of similarity of constitution the substances forming them are conveniently studied by reference to their particular series. For example, the paraffins comprise the following bodies: methane, CH.; ethane, C.H.; propane, C.H.; butane, C.H.; ethane, C.H.; propane, C.H.; butane, C.H.; ethane, C.H.; containe, C.H.; ct. It is seen that each member contains one atom of carbon and two atoms of hydrogen more than a molecule of the preceding member, and the series as a whole may be represented by the algebraic formula C.H.; The homologues, or members of a H. S., may usually be obtained by similar methods, and they are alike in their general properties. Other H. S. are the olefines, general formula C.H.;; the acotylenes, general formula C.H.;; the monohydric alcohols, general formula C.H.;; the monohydric shedness; fatty acids, etc.

Homology, conformity of type which is suggestive of development or inheritance from a common ancestor, and is used as one of the morphological arguments which support the Darwinian theory. H. may be indicated by members of the same class, resembling one another in their general plan of organisation, as in the case of the mouth parts of insects, though these show innumerable varieties of form and use, or as in the case of the general structural resemblance of the arm of man, forcleg of horse, wing of bird, flapper of seal. Serial homology (also called metamerism or metamic segmentation) is that unity of type found on comparing the different parts or organs in the same individual, e.g. the segments or rings and their appendages which comprise the body of a worm.

Homology, see may water miniminately. Homology, see may water to one of the two sub-orders of Hemiptera (bugs) (q.c.), whose members differ from those of the Hoteroptera in that their wings cover the abdomen in a rooflike manner and both pairs of wings are alike (hence H. = similar wings). Heteroptera = different wings). The basal and apical parts of the wings are generally of the same consistency, and sometimes all four wings are transparent: the head is furnished with three occili (simple eyes) placed triangularity on the summit, and the front of the head is bent over, touching the cover (head is bent over, touching the cover (head is per lice). This suborder includes the Creadide, Gulgoride, Membracidie, Cercopides, Jassides, Psylides, Aphda (green filos), Aleurodides, and Coccides (e.g., the cochineal insect).

Coccide (e.g. the cochineal insect).

Homs, (i) tu. in Libya, pop. 30,000.
(2) tn. and sanjak of Syria, see HKMS.

(2) to, and sanjak of Syria, see Hews.

Honan, one of the Central Provs, of China, bounded on the N by the Hwangho, on the S. by Hupeh, on the E. by Nganhui, and on the W. by Shend. The country is traversed by the Funiu Shan Mts., running E. and W. It is very densely populated, largely owing to the fertility of the soil. The chief products of the prov. are cotton, wild silk, cereals, and fruit. Coal is found near Honanfu, Juchow, and Lushan: other minerals are fron, sulphur, and saltpetre. Some optum is grown, the traffic in this being very extensive, especially the morphia pill traffic in the N. part of the prov. To the N. of the Hwangho, there is a heautiful fertile plain, with hamboo plantations and groves of cypress. There are good roads and the Peiping-Hankow Railway traverses the prov., having branch lines to Honanfu and Kaifeng (the cap.). During the civil war much fighting was carried on in H. The area is 64,500 sq. m. Pop. 28,473,000.

the civil war much against was carried on It. The area is 64,500 sq. m. Pop. 28,473,000.

Honanfu, city in Honan. China, situated on Lo R., a trib. of the Yellow R. Under the Chon and following dynasties, it was the cap. of China and was called Lo-Yang. Coul mines are in the vicinity. During the civil war Marshal Wu fled to H., on the fall of Chongchow in 1927.

Honawar, or Honore, seaport on W. coast of India, N. Kanara dist., in the Presidency of Bombay. It was visited by Ibn Batatu (1342). Pop. 59,900.

Honda, tn. (alt. 690 ft.) of Colombia, S. America, on the Lower Magdalena R., 60 m. N.W. of Bogota. The riv. is navigable up to this point. The tn. is an old Sp. settlement with picturesque narrow streets Pop. 12,000.

Hondecoeter, Melchior d' (1636-95), Dutch painter, b. at Utrecht, Holland, a pupil of his father, G. de H., and uncle-Jan Baptist Weenix. He was a skilful painter of poultry, depicting the feathered families with great sympathy. His most famous painting, 'The Floating Feather,' famous painting, The Floating Feather, hangs in the Amstodam gallery. Honder, coeter's paintings may be seen in the National Gallery, London, and in the Liverpool, Herlin, Dresden, Hague, Paris, Leningrad, Florence, Venice, and Vionna galleries.

Hondo, see JAPAN.

Honduras, republic of Central America. lying between the Caribbean Sea on the N., Nicaragua on the S. and E.. and Guatemala on the W. Area about 41,300 sq. m. The country is mountainous forming an elevated tableland of an average height of 8000 ft., rising to 10,120 The Cordillers are continued from Nicaragua into the S. portion of the country. The highlands of H. are not so high as those of Guatemala, to which they are closely related colomically. The vol-canic plateau, with its flows of dark-coloured lava and its beds of ash, faces with the steep escarpment toward the Lempa Valley of Salvador. The highest Lempa Valley of Salvador. The highest elevations are in S. H., near La Esperanza and Tegucigalpa, where there are sev. peaks about 8000 ft. high. There are a few inter-montane busins composed of gently rolling, tilly surfaces which lie at elevations between 3000 and 4500 ft. Block ranges, similar to the central high-Block ranges, similar to the central nighlands of Guatemala, are found in N. H.
The chief valleys are the plain of Comayagua, and those formed by the rivs.
Humuya and Goascoran. The former is a trib. of the Ulun, the largest riv. in the country, which flows N. into the gulf of H. Other important rivs. are the Segovia, forming the houndary with Meanware forming the boundary with Nicaragua, the longest riv. in Central America; the Nacaome, Aguan, Rio Nogro, and Choluteca. The chief is, belonging to H. are the Bay is, and Tigre, Sacate Grande, and Gueguonsi in the bay of Fonseca. The climate along the Atlantic coast is oppressively hot, but on the highlands the temp. is mild. Cattle-rearing is the chief indusis mild. Cathe-rearing is the chief industry of the inhabs., but breeding is not carried on scientifically. The woods yield valuable tinber, It. has an abundance of hard and soft woods. Mahogany and other hardwoods grow in the N.E. part of the country, in the valleys and near the S. coast. The most important hardwoods other than mahogany. near the S. coast. The most important hardwoods, other than mahogany, are grenadino, guayacan, walnut and rose-wood. Stands of pine occur widely in the wood. Stands of pine occur widely in the interior. Bananas, coconuts, orangos, lemons, maize, tobacco, cocou, indigo, and sugar are cultivated. The chief culture is that of bananas, which are grown on the Atlantic coast. In 1943—15 over 9,000,000

United States. Panama hats, footwear, cigars and soap are the chief manufs. mineral resources of the country-which comprise gold, silver, platinum, copper, antimony, zinc, etc.—have not been developed on a large scale: only gold and silver are now mined. Brown coal seams have been found. There are rich fisheries as yet undeveloped, and Turneffe sponges are the finest in the world.

Cape II. was discovered by Columbus in 1502, and became a Sp. colony. Comayagua, in the rift valley, was for a long time, the leading th. of the highlands of H. Founded in 1540 on the road between the silver infees and Guatemala, it became the political centre of this part of the Sp. domain, and continued to perform the functions of local administration until Tegnicipalpa was selected as the cap. of independent II. in 1827. The settlements, which are grouped in the rift valley around Comayagua, like those farther W, grow muize for local subsistence, and produce coffee and cattle for sale. In 1821 it threw off the Sp. yoke and loined the Federation of Central America. In 1839 it became an independent state, and was subsequently in volved in frequent wars with Guatemale silver mines and Guatemala, it became the volved in frequent wars with Guatemala It has suffered from internal strife, parti-cularly during the civil wars of 1883 and 1903. In 1907 war was declared against Nicaragua in which Bonilla, the Hon-duran president, was defeated. In 1911 that general was re-elected president. There was a rising in 1931 in the N. due to unrest among the banana plantation workers led by General Ferrera, who was killed by Govt. troops. A Congress of Deputies composed of thirty-eight members is elected for six years by popular vote and is in session for some two months of the year. The executive power is vested in the President, who is nominated and elected for four years. When Congress is not sitting, affairs are directed by a permanent Commission of some five members—a modification of the Constitution which dates from 1921 (and further modified in 1936). The administration is in the hands of a council of ministers. The National Univ. is at Tegucigalpa, the cap. (pop. 66,000). Other tns.: San Pedro Sula (22,100), La E-peranza (11,000), Nacome (10,000), Santa Rosa de Copun (6000), Choluteca (5000), Comayagua (5000). Ports: on the Atlantic coast, La Ceiba (12,100), Tela (10,400), Puerto Cortez (8000), and Truillo (7500); on the Pacific coast, Amapula (3000). The port of entry for the bay Is. is Rostan. The total pop. (1945) was 1,200,500, including aboriginal tribes, 35,000 (chiefly Mosquito and other Indians all speaking different languages). by a permanent Commission of some five Indians all speaking different languages).
The Sp. speaking inhabs, are chiefly mesticos, i.e. Indians with an admixture of Sp. blood. On the N. coast there is a considerable proportion of negroes, working for fruit-trading companies; some 3000 of these are Brit. subjects and their immigration is now forbidden.

By the completion in 1943 of the Inter Atlantic coast. In 1943-45 over 9,000,000 Amer. Highway, H. is connected with stoms were exported, mostly to the highway system of Guatemala, El

Salvador and Nicaragua. An Inter-Ocean Highway linking Tegucigalpa with both the Caribbean Sea and the Pacific Ocean, is under construction. There are only three railways and these are confined to the N. coastal region, where they are used mainly for the curriage of bananas. Tegucigalpa is not served by any railway and there are no international rail con-nections. The total railway mileage is The road service, generally unsatistic has been improved. There is factory, has been improved. There is an air service and telephones and tele-graphs. There are seven gov. wireless stations and four broadcasting stations. See H. Jalliny. La République de Honduras, 1898; R. M. Lopez, Geografia de Honduras, and Historia de Honduras (Tegucigalpa) 1919; A. B. Quinones, Geografia e Historia de Honduras (Choluteca) 1927; toria d. B. Reyna, Honduras (Tegnelgalpa), 1930; C. M. Wilson, Central America, 1941; Preston E. James, Latin America, 1941.

Honduras, British, see BELSIZE and BRITISH HONDURAS.

Honduras, Guif, or Bay of, broad basin of the Caribbean Sea, skirting Honduras, Guatemala, and Brit. Honduras in Cen-

tral America

William (1780 - 1812),Hone, phletcer, set up in 1817 as a bookseller, and soon became notorious as a publisher of political lampoons, for the issue of one of which he was unsuccessfully prosecuted. He became yet better known when he issued sev. satires written by himself, with illustrations by George Crukshank. The best of these are The Political House that Jack built (1819), and The Monn in the Moon (1820). Perhaps he is to-day hest remembered by his Leery Day Rook (1827), and his Table Look (1819), which are still obtainable in modern eds.

Honegger, Arthur, Swiss composer, b. at Le Havre, France, 1892. He possesse-great technical ability, and has evolved a modernist style through contrapuntal modernist style through contrapuntan methods. Especially important are his oratorie King David (1922) and his 'mined symphony' Horace Victoricur (1922); and he is the composer of the popular 'programme 'piece', Pacific No. 231 (1923), which was inspired by a modern Amer. long-distance locomotive (and closely imitates its noise by the means available in a symphony orchestra), and Rughy. H. is one of the group of composers known as 'les Six.' See Studies by A. Roland-Manuel, 1925; A. George,

1926; and W. Tappolet, 1938. Honesty, or Lunaria biennis, species of Cruciferse, grown in Brit. gardens, is a native of Europe. It is a hardy plant bearing racemes of likac-coloured towers which have no scent, and the fruit which

follows them is a silicula.

follows them is a silicula.

Honey, thick syrup collected by bees and also by a few species of wawn and by honey- or pouched-ants. The bees suck meetar from flowers and empty it from their crops into the cells of their hives.

H. is most plentiful where flowers lux-crists and when the weather is dry and warm. The endry yearned the H of Mt. The ancts. vaunted the H. of Mt. Hybia in Sicily, and the aromatic, highly-

granulated II. of Narbonne is famous to this day. Virgin-H., gathered by young bees before they have swarmed, is finer than the H. of old hives. The colour than the H. of old hives. The colour varies with the source: heather-H. is a deep golden-yellow, and the H. from white clover a greenish-white. The Koran refers to if. as a liquor' wherein is a medicine for men,' and in India and elsewhere its value as a gentle layative has long been recognised. It was a favourite article of food among the ancient (iks., and was an ingredient in such popular beverages as mead, the 'claire' of (hancer's day, and the Rom., 'mulsum.' Chemically, it. is composed of levulose (36 45 per cent.), dextrose (36 57), water, mineral matter, pollen, and wax. On an average H. contains over 70 per cent of invert sugar (q.r.). Sturch, water, glucose, and gypsum are common adulterations. In norsum are common adulterations. In normal years, Hungary and Poland are among the chief H. producing countries, in favourable years Hungary can produce 9000 tons. It is also imported from California, New Zesland, and Australia. It is a minor colonial product. There are small bee keeping industries at Mauritius, be keeping industries at Mauritius, Cyprus, Palestine, Brit. Honduras, Brit. Guana and various W. Indian colonies. The only colony with a substantial trade is Jamaica—averaging 800 tons annually.

Honey-buzzard, popular name of Permis apirorus, a species of talconiform bird belonging to the family Butconing. It is occasionally found in England and is common in the wooded dists, of W. Europe, troin whene it intgrates in winter to Africa. Its food consists of insects, small maninals, birds, etc., which it devours upon the ground; it derives its name from the habit it has of plundering the nests of bees and wasps for the sake of the honey. The plumage is variously coloured and is often undistinguishable from the dense foliage in which the H. prefers to nest.

Honeycomb-moth, popular name given to members of Cintleria, a genus of lepidopterous insects belonging to the family Pyralide. Certain of the species namity Pyrainde. Certain of the species miest bechives, where they deposit their eggs; the larvie feed on the count, through which they make tunnels. There are two broads in the year, the first appearing in May and the second in full summer. G. mellonella is the largest and best-known

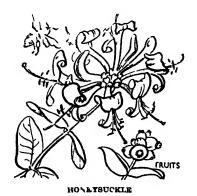

species.

Honey-dew, sweet and sticky exudation found, especially in warm, dry weather, on the leaves and stoms of many trees and plants. Some hold that it is invariably associated with Aphides. Cocci, as, for instance, Coccus mannifera, and other insects. For it is known that Aphides excrete from the abdomen a fluid Indistinguishable from the theory believe that guishable from H., the theory being that they prick a hole in the leaf or stalk and so suck the excess of sugar from the flow-ing sap. Others believe that without these insects H. would still form whenever the tissues of the plant are broken. H., which is also called manna, has been known to fall in showers. As it closes the pores when it dries, and thus hinders the natural growth of a plant, gardeners use a syringe to wash it away. Honey-eaters, name given to the species of Mcliphagida, a large family of passert form birds found in the Australian region They are small birds with beautifulty coloured plumage, long curved beaks, and long tails their habits are active and pugnacious, and they are constantly hopping from true to tree in scarch of honey and insects which constitute their food The species of Meliphaga are among the most brilliantly pluminged of all birds Mauricoms being on of the best known Anthomis the New Zeiland bell birds and Manorhina melanophrys the bell bird of Australia are remarkable for their clear tinking voice

Honey Flower, see MFTIANTHUS

Honey-guide name given to the species of Inticular and Prilodiscus two genera of consulform birls which constitute a sub family Indicatorine. They were formed to placed an ing the encloses but are more nearly related to the woodpeckers and barbets must of the species are found in Africa but I rechipelagus and I menor inhabit the Malay Pennsula and Borneo. Their name is derived from their curious habit of confucting tray liers in the direction of been nests by means of a shrill ery or has and they will flutter round until they are sure that they are bying followed. Pregular is a native of Natal and Panagas of Equatorial Africa.

ATHER
Honey-locust Tree, or Three-horned
Acacia, 1 of the name of the legan mous
plant the hit of a triandhes a native of
the Carolinas and Virginia. The trunk
and branches of the young tice are
covered with prickles the foliage is of a
light shuming aren and the seeds are
covered with a sweet pulp.

Honeysuckle, or Lonuera Perulymenum, species of Caprifoliacee found in hedge rows of Birtain, often known by the name of woodbine. It is a shrub of climbing habit, bearing heads of white flowers which yield a sweet fragrance, at night hawkmoths are attracted to the plants by their scent, fertilisation takes place and

the flowers change to a yellow colour The fruit of the H is a bright red berry The term Fr. H is applied to the leguminous herb Hedysarum coronarum, which grows in Spain and Italy It is a hardy peren nist which bears deep red or white flowers, and in Calabria is given to horses and mults as food

Honeysuckie Tree, see BANKSIA

Honileur, seaport on the bank of the being catuary, 8 m 5 E of Havre, in the dept of Calvados, France It is a rail way terminus, controls a brisk fishingtist and exports agric produce to England There are antiquities of interest Por 8300

Hong Kong (from Hiang-Kiang, fragrant strong a), is in the China Sea, separated from the coast of China by the Lamun from the coast of thina by the Laimun or I vemoon (Carpfish) Pass, a strait less than half m in width H k is a intercolonal dependency and hes S of kwingtung Prov and k of the Pearl R estury. The colony includes the ters of Hing kong is which has an area of 32 at m with a length of 11 m and a breatth varying from 2 to 5 m. the S tip f the mainland pennisula of Kowloon with m a 14 sq m, and Stonecutters is, con it of an area of hinterland with many is (net 3) sq m) The New Ters
stick h northwards to the shum Chun
R and include the seables of Deep Hay
to the W and Mus Bay to the E. The total area of the colony is thus about oth area of the colony is the about 31 a; in most of which is steep and in productive hillside. If K. Is rises steep is from the N shore to a range of treeless hills of volcanic rock of which the highest point is Nictoria Peak (1823). the scencia especially along the ft) de is indonted shores is superbile to ween the hills and the N water front lies to ity of Victoria. Most of the urbilet if the is is fist increalined land. In is a almost land locked natural barbeer values in width from I to 3 m and is ente ed from the l by a tep water chan nel through Lamun Poss and protected free the W by a cluster of is through the the way by a chiefe or a through with a shall were channel gives access to stal vessels. If k harbour has been the gateway to schina, lying, as the challenge of the kowbon Penhaula, which was the characteristics. is flit and has been extended in area by reclanution has gr wn greatly as a reliental suburb and besides, contains the chief industrial are a of the colony, on the W shore are wharves tor ocean-geng ships and at the being of the poulo ult is the terminus of the kowloonutto Railway Between kowloon and the New Tera to the New Tera are steep and harren, the high st point being the peak lamosh in (110 ft), 7 m N W of killon, NW of while peak to the celony's largest area of cultivable land stretching to Deep Bay. The E half of the New Tera mainland, mountainous and unincidustive extends to the colory and stretching to the peak to the colory and the stretching to the peak to the section of the total stretching to the peak to the section of the total stretching to the section of the total stretching to the section of the sect unproductive, extends to the rocky and indented coastline of Mira Bay Where cultivation is possible vila exist and crops are grown; intricate terracing brings as

much land under cultivation as possible and the traditional methods of Chinese farmers have changed as little in H. K. as in China. Few of the 75 adjacent is, included in the New Ters. show traces of the impact of W. civilisation and many are uninhabited. The largest is, is Lantan, rugged and beautiful, lying W. of the harbour. It is more than twice the size of H. K. is, and its highest peak is 3000 ft. Wooded ravines and scrub-covered spurs, where may be found plenty of wild boar and barking deer, slope steeply upwards. The other is, are much smaller, the smallest inhabited is, being Ngai Ying Chau (8 ac.). The total estimated pop. of the New Ters. is 60,000.

Cimale.—The climate of H. K. is subtropleal and conditioned largely by the monsoons, the winters being cool and dry and the summers hot and humid. The climate is unfavourable to Europeans owing to the rapid alternations of heat and cold and the chief tn. retains the violent heat of the sun long after sunset, being hedged in by rocks which keep off the cool evening breezes; but for six months of the year the weather is cool and dry with long periods of sunshine daily. The summor is the rainy season, three-quarters of the anu. rainfall falling between May-Sept. Fog and very low cloud are common in March and April when S. winds may temporarily displace the cool N.E. monsoon, which sets in during Oct. and lasts till April. The S.W. monsoon prevails from May to Aug. From June to Oct. H. K. may be affected by typhoons, but they are sometimes experienced before and after this period. A typhoon whose centre is over or near H. K. is accompanied by hurricanes, which may result in much damage and loss of life. The mean monthly temp, ranges from 59° F. in Feb to 82° F. in July, the yearly average being 72° F. The temp, rargely rises above 95° F. or falls below 40° F.

Commerce and Industry.—The main primary product of H. K. is slip, deep-sea fishing being an important occupation. Agriculture is limited by reason of the rugged and mountainous terrain and mineral resources are believed not to be great. A new Dept. of Agriculture was set in very soon after the colony was retaken in 1945, which not only did much to restore the farming industry to what it was before the war but also to establish it on a much sounder basis with a view to steady development on scientific lines. Some progress was also made towards the organisation of co-operative production and collective marketing was estab, in a few areas among tomato-growers. A small Gov. experimental station which existed in the N. Ters. before the war was restarted after the Brit. re-occupation. Before the war thore was a Botanical and forestry Dept., which took charge both of the Botanical Gardens and gov grounds and of the afforestation of the bill-sides. After the war it was decided to have two independent depts., one for forestry and one for gardens. What little mining is done is entirely in the New Ters. Only five small mines are at present being

worked; one produces load and silver, two are working wolfram deposits with indifferent success, and the other two produce kaolin and magnetite respectively. Local industry includes shipbuilding, ship repairing, engineering and a wide range of light industries, the main products of which are textiles, rubber goods, buttons, leather goods, cigarettes, matches, pre-served ginger and confectionery, tinned goods, glussware and paint. The majority of H. K.'s working pop. is engaged in occupations connected with commerce companies connected with commerce rather than production but onterprise and cap, are not lacking when an economic demand arises which can be satisfied by the expansion of local industry. H. K.'s industrial production is almost entirely in Chinese hands, most of the factories being ber of factories registered in 1941 was 1200; at the end of 1948 200. 1200; at the end of 1946 36° wire leadstered and a further 537 had applied for The outbreak of war with registration. Germany had a stimulating effect on the colony's industries, particularly on the larger dockyards and on local factories producing war equipment; but during the war against Japan industrial activity in the colony was brought virtually to a standstill. By the end of 1946 the recovery of production capacity varied from twenty to fifty per cent of pre-war levels.
On the whole little direct war damage was done to factories except to the shipbuilding and repair yards and to a sugar refinery; machinery was in many cases removed by the Jap, and could not be re-covered. Refore the war more persons were employed in the textile industry than in any other single industry, there being 25,000 engaged in cotton weaving boing 25,000 engaged in cotton weaving in 150 factories—making cheap shirtings and prints for export to Malaya, Ceylon, and E. and W. Africa; and 15,000 in 450 knitting factories. At the end of 1946 there were 90 cotton-weaving factories in operation and practically no knitting factories. The manuf, of electric torch batteries gave work before the war to 2000 or 3000 workers in twenty factories. During 1945-46 ten resumed operation, but production in 1946 was restricted to about twenty per cent of pre-war. were also eleven factories engaged in the manuf of preserved ginger, all of which resumed operation in 1916, but the total of employees amounted only to 500 as against 3000 in 1941 and production was far below pre-war level.

The chief tn. of H. K. is Victoria, the seat of gov. and of trade, which stretches for 5 m. along the N. coast. It is built in three layers, the Prnya or Esplanade, which is given np to shipping, the Chinese quarters being beyond the commercial portion; the second layer which contains gov. houre and other public buildings and the Peak, or third layer, which is reached by a cable tramway. Before the war frequent scheduled passage and cargo services connected H. K. with the world. Ships of many nations were to be seen in the harbour, the most frequent callers, apart from the Brit. P. and O., Blue Funnel, Ben Line, Bank Line, Ellerman's and

Canadian Pacific Lines, being Amer., Scandinavian and Fr. ships. In addition to ocean-going tonnage, there was a large to ocean-going tonnage, there was a targe traffic in cargo and passengers between H. K. and Chinese provs.; this was largely carried on by sailing and motor junks, but riv. steamers, Brit. and foreign, also accounted for a fair proportion. The port facilities were seriously impaired both as a direct result of hostilities and also through neglect during the Lan. ocalso through neglect during the Jap. oc-oupation. The total shipping entering and clearing during 1946 was 45,484 vessels of 11,244,311 tons: this, compared vessels of 11,244,311 tons; this, compared with 1939, showed a decrease of 29,133 vessels and a decrease of 19,653,637 tons. Some 37,922 vessels (10,988,170 tons) were engaged in foreign trade, compared with 23,881 vessels (21,196,466 tons) in 1939. But throughout 1946 there was a steady quarterly increase in the number of vessels using the port the tonnage rising from 492,189 in the first quarter to 1,403,021 in the last. Over 1946 foodstuffs beaded the list of imports (about H. K. \$210 million) followed by oils and fats (\$114 million) plece goods (\$100 milfats (\$114 million) piece goods (\$100 million) and metals (\$10 million). The larnon) and metals (\$10 minon). The largest item of experts in 1946 was ols and fate (\$143 million), followed by piece goods and textiles (\$128 million) fond stuffs and provisions (\$116 million), Chinese medicines (\$40 minon), metals (\$20 million) to the constant of \$20 million). (\$39 million) and paper-ware (\$31 million). Trade returns do not differentiate between re-exports of overseas commodities and those produced in the Colony, but exports of those goods in which local factories are interested show that singlets, shirts, etc., (value \$13 million), electric torches and

(vaine \$13 million), electric forches and batteries (\$9 million) and rubber shoes (\$34 million) were exported.

Government.—II. K. is administered by a governor assisted by an executive council and a legislative council. The executive council, which is consulted by the governor on all important administrative matters, includes the senior military tive matters, includes the senior military officer, the colonial sceretary, the attorney general, the secretary for Chinese affairs, the financial secretary (who are members ex officio), and such other members, both official and unofficial, as may be appointed. At the end of 1947 there were eight official members (including the five excellers members) and seven unofficial members. officio members) and seven unothcial members, two of whom wore Chinese. The legislative council consists of not more than nine official members, including the same five ex officio members listed above, and not more than eight unofficial mem-bers. At the end of 1916 there were nine bers. At the ond of the control members and seven unditicial members. The procedure of this Council, with the advice and consent of which all

posals for a revision of the constitution, providing for the estab. of a municipal council (to which many of the functions of the present gov. would be delegated), and consisting of lifteen members representing the Chinese, and lifteen the non-Chinese sections of the pop. At the resumption of civil gov. in 1946 the normal judicial system of H. K. was restored. The Supreme Court of H. K. has the same jurisdiction as the English Courts of Kings Bench, Common Pleas and Exchequer have or had in England, and is a Court of Oyer and Terminer and Gaol Delivery, Assize and Nisl Prius, with jurisdiction in Probate, Divorce, Admiralty, Bankruptoy and cruminal matters; and it is also a Court of Equity with such and the like jurisdiction as the Court of Chancery has or had in England.

or had in England.

Education.—H. K. has a voluntary system largely in the hands of gov. and of missionary bodies. The present system may be said to have started in 1913 when the Education Ordinance, from which the director of education derives his legal powers came into operation. The medium of matruction in schools varies from one category of school to another. In some, Eng. is the sole language: in others, Chinese: and a number of schools have classes in both languages. The grantaded schools mainly use Eng. The military schools cater for the children under the age of eleven of serving officers and over out the stoff is recruited from the and men and the staff is recruited from the Army kducational Corps and the Queen's Army kchoolinistresses. Normally secondary education in Eng. is to a great extent in the hands of gov. and grant-aided schools. Within the urb. area in 1941 there were 649 schools, 529 of which were private schools (i.e. those not in need of, or which do not merit gov. subsidy) 91 subsidied, 9 gov. and 20 grant-aided. Education in H. K. is not free although 10 per cent of the pupils in gov. schools are awarded free places. The univ was lucorporated in 1911 and opened formally in 1912. In 1941 a new science building was opened a few weeks before the outbreak of war. The supreme governing body of the univ, was the Court, with life, er officio and nominated incubers, the and men and the staff is recruited from the er officio and nominated members, the executive committee, and a senate composed of the vice-chancellor, the director of education and the profs. and readers. There were four faculties, medical, engineering, arts and science; and the total number of students was a little over 500. Larly in 1946 the secretary of state for the On the future of the univ. An immediate effect of the fall of the Colony was the grievous damage wrought on the univ.

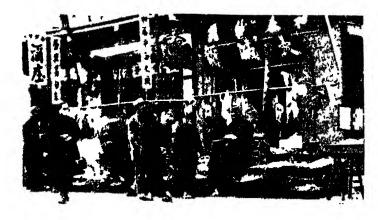

The only Colonies appointed a committee to advise with the advice and consent of which all legislation is enacted and by which all expenditure from public funds has to be approved, is based on that of the lirit, buildings by whole-ale looting. The only buildings of Commons. There are three standing committees of the legislative council—the fluance committee, the law committee and the public works committee—and select committees are from time to time set up to advise on matters before the council. In 1947 the secretary of state for the colonies approved proCommunications.—An electric transway lowed the treaty of Nanking. One of the with 19 m. of track and new motoring roads were opened before the war. Over 400 m. of roads are maintained, 173 m. of freedom of the port and the freedom of which are on the is, of H. K., 106 on Kowloon and the remainder in the New Ters. Chiusse race were preserved in accordance with a policy which ensured for the colony modern metalled construction. The road the role of entrept both for the trade of corrects suffered considerably from register and for the labour of China's S. provs. system suffered considerably from neglect during the Jap. occupation. Two new roads, both in the New Ters., were built during the Jap. occupation: one to the top of Taimoshaa built to serve as a Jap. early warning radar station, whilst the other, leading to Saikung vil., was de-signed to facilitate Jap. military operations against the Chinese guerillas. Kow-loon is the S. terminal of the railway system extending to Hankow. From Shum-chun on the border of the New Ters. N. to Canton the route is now operated by the Canton-Hankow Railway, from Shum-chun S. to Kowloon (a distance representing 36 km. out of a total of 183 km. from Kewloon to Canton) the railway is operated by the H. K. gov. and is known as the Brit. section of the Kowloon-Canton Railway. At the present time, pending the conclusion of a new agreement, the Brit. section is receiving a share amounting to 20 per cent of the receipts and a ter-minal charge of 20 cents per ton on all traffic originating at Kowloon. H. K. is a most important link in the net-work of post-war aviation but to retain its place it requires a first-rate modern aerodrome. A weekly flying-boat service to the United Kingdom was set up by B.O.A.C. united a inguoin was set up by B.O.A.C. in Aug. 1946 (a six-day journey) and the colony is connected by the services of Chinese air transport companies with Shanghai, Nunking, Chungking, Kunning, Hainan Is., and Canton. The colony's only airfield, Kaitak, is to the N.E. of Kowloon, a lifteen min, drive from Kowloon's chief betal. Situated under a steep range of hills rising at one point to 1300 ft. it is an airfield which by modern standards leaves much to be desired. Jap., during their occupation, carried out a considerable extension of this aerodrome, doubling its size at the expense of adjacent Chinese houses and fields and of the former civil sirport buildings; but despite these improvements the aerodrome remained inadequate for heavy aircraft.

History.—Prior to 1841 the is, now known as H. K. was inhabited by a few fishermen, stone-cutters and farmers, and provided a notorious hidne-place for smugglers and pirates. In that year it was occupied by Brit. forces partly as a reprisal for the treatment of Brit. merchants in Canton, and partly to provide a scenre basis for trading with S. China merchants. The cession of the is, to the Brit. Crown was confirmed by the treaty of Nanking in Aug. 1842. The conven-tion of Peking of 1860 added the Kowloon Peninsula and Stonecutters Is. to the Crewn Colony and under a later convention of Peking, concluded in 1898, the area known as the New Ters., including Miss Bay and Deep Bay, was leased to Great Byttain for 99 years. Naarly a century of uniroken peaceful development fol-

the rôle of entrepôt both for the trade of and for the labour of China's S. provs.; afforestation, extensive reclamation of foreshore, cultivation of the lower slopes. and a not-work of motor roads cut into the hills, combined with the steady and natural growth of Victoria itself, to present to the ocean-going ships which lay in the harbour in 1941 a picture very different from that which met the first merchantmen who watered off the S.W. coast of the is. or the first pioneers who explored the hostile hills in quest of pirates; besides which sanitation, anti-malarial work and public health administration combined have removed all evidence of the 'plague spot 'which the new colony was thought The rich interior of to be a century ago. the mainland was linked by railway with the wharves and warehouses of H. K.; schools and a univ. were estab. ; Chinese, European and Amer. air-lines met in the colony's airport; shipvards and docks able to accommodate the world's largest liners were constructed; light industries were started and prospered. Also, if of doubtful benefit to H K., the colony be-came known as an impartial refuge during the internecine strife which ensued in China after the inauguration of the Chinese Republic in 1911 and, later, when China was attacked by Japan. In H. K. the shadow of Jap. aggression was scarcely perceptible when Manchuria was attacked; it darkened somewhat with the tall of Shanghar in 1937 and lay over the colony, heavy and monacing, after the fall of Canton at the chd of 1938. The colony's pop, increased to over one and a quarter million, swelled by homeless retogees from S. China, who could be neither housed nor turned away. In ascertaining, before Japan entered the Second World War, how many persons would have to be fed and sheltered during air raids a census taken in 1941 showed that 709,291 persons were living on the is. ; 581,431 in Kowloon, and 154,000 in boats, giving a total of 1,441.725. There were then just under 8000 Britons exclusive of the garrison. This census showed that so great was the congestion that at least 20,000 people were habitually sleeping in the streets.

When Japan suddenly entered the Second World War on the side of her Axis (q.m.) associates, her forces at once bombed B. K. (Dec. 7). The defences of the is, and of Kowloon had been much strong-thened and these, supplemented by the mentation as nature of the colory, were apparently believed to offer every probability of successful resistance. It is, however, to be borne in mind that under the Washington Treaty of Education of Naval Armamouts, 1922, the contracting parties agreed to meintain the status quein regard to fortifications and naval bases. The Jap. gov. denounced the treaty at the end of 1934 and, in consequence, the treaty lapsed on Dec. 31, 1936. Until the latter date, therefore, the Brit. Gov. were precluded from erecting additional fortifications at H. K. But apart from this, it was always obvious to the anthorities that the position of H. K. would become very precarrous, lying as it does so near to the homeland of Japan, in the event of war with that country. The garrison, added by the Navy, made a desperate against huge odds. By mad-Dec. Kowloon was in Jap. hands and the garrison of that prainsula prepared to with-draw into H. K. is. Jup. land artillery,

commanders. The garrison consisted of Regular and total Volunteer elements, Brit., Indian and Chinese, and a fine contingent of Canadian troops. But air force activity was necessarily restricted nor could Brit. ships operate effectively in such narrow waters. Thus the tiny Canton gunboat, Hobin, was destroyed by ber own crew after fighting to the last moment, while her sister ship, the Cicala, was sunk by bombs and all the small harbons craft were set on tre. Ashore, everything which could be of service to the enous, including wharves, docks, equipment and stores, was wrecked or burned.

naval forces and bombers were now cease- | in accordance with the scorched earth " lessly bombarding the colons and trying to disrupt the retirement from kowloon by plunging shells into the narrow stretch of water separating Kowloon from II. K. All Brit, troops were also withdrawn from All Brit. troops were also withdrawn from the 300 sq. m of leased ter. on the mainland. Air raids on the is, were not remarkably effective owing to the fact that rocky Victoria peak was honeycombed with first-rate shelters and supplies were protected by the hills. Victoria iteal, built partly in a solid block on the Kowloon leannands on the mainland, partly on recognized land or steen billeids on the is reclaimed land or steep hillside on the is. opposite, was now, together with its naval yard, under enemy are from the mainland; while the less densely inhabited S, side of while the fast definely ininitated S, side of the is, could now use bombarded by long range heavy guas of the Jap, fleet lying near the is, of the S. On Dec. 17 Str Mark Young, governor of H. K., rejected a Jap, proposal to enter into negotiations

jolas, in the closure days of the siege. civilians were remarkably steady under me, but by this time (Dec. 15) the spectre of thirst was haunting the people. the next day the But guns silenced no never than five Jap, batteries, while antiarreaft tire brought down masy Jap. bombers. But on that day the Jap. made bombors. But on that day the Jap. made landings in considerable force and also out telegraphic communications with H K. Later in the day after stiff fighting they gained possession of Victoria City and most of the is. By now the enemy and most of the is. Is now the enemy had more than 20 000 nee on the is, alone and were using their undisputed command of the au to full advantage. The moment Jap thoops landed, small units, armed with fourniv-guns, mortars and grounder produce require for the advance position. and groundes, made for the strong points marked on their detailed maps. Others mean the is, of the S. On Dec. 17 Sir marked on the dealed maps. Others Mark Young, governor of H. K., rejected a Jap. proposal to enter into negotiations of surrender and refused to accept any they appeared to be familiar, began to some further communications from the Jap.

the enemy indulged in their usual indis-criminate bombing before the final as-sault, civilian casualties never exceeded 150 a day. Indeed civilian casualties, both European and Chinese, seem to have both European and Chinese, seem to have been surprisingly light, possibly because no fighting occurred in the teeming cen-tral dists. of Victoria City. Gov. House was badly damaged by bombs. The Military Hospital was hit 29 times. Many fine houses on the Peak were wrecked; but the splendid new building of the H. K. Bank stood up well to shelling The Gloucester Hotel was only slightly of the H. K. Bank stood up well to shelling The Gloucester Hotel was only slightly damaged and the Queen Mary Hospital was neither bombed nor shelled. The gallantry of the garrison was beyond praise and the Indian troops showed magnificent bravery. But the colony was literally rocked from the repeated ex-plecions when the last relentless measures plosions when the last relentless measures were taken before shortage of water com-pelled the defenders to ask for terms. In the interests of humanitarianism the gar-rison was at last forced by the horror of thirst if not of actual want to negotiate a surrender. Among the many examples of courage in the battle for H. K. was the or courage in the battle for H. K. was the heroism of an officer, who, having defended his munition store with great tenacity blew himself up with the store rather than allow it to fall into the enemy's hands. Another gallant episode was an all night fight for the Repulse Bay Hotel on the S. side of the is., during which the defenders, using an old archery set found in one of the rooms, fired flaming arrows into the under rooms, fired flaming arrows into the under-growth where the Jap. were lurking. The garrison of 'Taipans,' consisting mainly of over-age business men, holding the N. Point Power Station, resisted for days, firing rifles from every window at the oncoming enemy. A force of Indians coming enemy. A force of Indians fought a remarkable rearguard action down the entire length of Nathan Road, Kowloon kept their fire up while embarking, and continued to fire as they moved But the odds were always against the defence and while the mainland was being evacuated, the whole 32 sq. m. colony shook from many explosions, including the blowing up of a ferry boat loaded with dynamite, which shattered every window of the is. On the 23rd Canadian troops of the is. On the 23rd Canadian troops suffered and inflicted heavy casualties, their commander, Brig. Lawson and his chief of staff, Col. Hennessy, both being killed. The actual date of surrender was Christmas Day and one Brit. party succeeded in excaping from the is. In speed boats on Christmas night. Thus ended, temporarily, the hundred years of Brit. The colony of H K.

temporarily, the hundred years of Britrule of the colony of H. K.

The colony remained in Jap, hands for some three and a half years. The populicity fell from 1 million to less than half that number. In the face of increasing oppression and brutality the fundamental loyalty to the Allied cause of the Chinese who remained was never in doubt; parts of the New Ters, remained in the hands of Chinese guerillas throughout the war. In spite of the most vigorous punitive

sive organisations had no difficulty in securing the help of every class of Chinese resident in the colony. H. K. was event-ually diberated by units of the Brit. Parific Fleet on Aug. 30, 1945. The Jap. forces were taken prisoner and a military administration was set up under Rear-Adm. Harcourt as commander-in-chief. The military administration lasted until The military auministration issued distinguished by the services and in the previous seven months with the work of reconstruction, a result largely due to the cheerfulness and resilience of the Ohinese pop. Civil gov. was restored on the above date when Sir Mark Young resumed the governorship of the colony and the legislative and executive Councils were reconstituted. In June 1946 the gov. (as in other colonies) set up a committee to consider the relative merits of various schemes for the development and welfare of the colony under the provisions of the Colonial Development and Welfare Act, 1945. War crimes trials during 1946 were set up in H. K. by royal during 1946 were set up in H. K. by royal warrant. Up to the end of that year some fifty Jap. had been tried, nine condemned to douth, nine to imprisonment for ten years or longor, twenty-six to shorter terms and six acquitted; some seventy-eight prisoners were then still awaiting trial. The trials included those of Col. Noma who was head of the Jap. Gendary during the occupation and Col. darmerlo during the occupation and Col. Tokunaga, who was in charge of all prisoner of war camps; while amongst those awating trial were Adm. Sakonio, accused of ordering sixty-nine prisoners of the Brit. motor vessel Behar, sunk in the Indian Ocean, to be butchered on the deck of a Jap. cruiser, and Col. Kogi, the public prosecutor at the 'bloody trials' of 1943 as a result of which forty local residents of H. K. lost their lives.

In anticipation of the fall of Shanghai In anticipation of the fall of Shanghai (May 24-25, 1949) and the implicit threat to H. K. from a further Communist advance southward, the cruiser Januatea arrived on May 29 to strengthen the colony's defences, while a curiew of three months' duration was imposed in the frontier dists. Later Mr. A. V. Alexander, minister of defence, paid a visit to II. K. to impact its defences and, subsequently. the Brit. Gov. sont strong quently, the Brit. Gov. sent strong reinforcements.

reinforcements.

Pop. (estimated, 1917) about 1,750,000, the great majority being of Chinese race. There were in the Colony, excluding Services personnel, about 6000-7000 Brit. subjects from the United Kingdom and the Dominions, 2500 Indians, 870 Portuguese ettizens, 3000 Isrit. subjects of Portuguese race, many of whom had spent the war years in Macao, and also 250 Amers.

Honorius (reigned A.D. 381-423), emperor of Rome, b. at Ravenna. Three things notably characterise his reign namely, the inroads of barbarians, the energy of Stilicho, and the pusilianimity of the emperor. Stilicho was appointed He squardlan during his minority, and it was he who quelled the revolt of Gildo in Africa (397) and thrice drove the Gotha Africa (397) and thrice drove the Goths and Huns from Italy. In 400 he defeated daughters of peers. Formerly the style the combined forces of Alaric and Radagalsus; in 402 he defeated Alaric alone at Pollentia, and a year later he put Radagalsus to death near Fœsula. H. executed Stilicho in 408, and so was powerless to repulse Alaric, when he captured Rome a second time in 410. Ataulphus, a right to the distinction.

Alario's son, married Placidia, H.'s sister, but neither he nor H., nor any of the host of usurpers could maintain even a semblance of imperial power. See Gibbon, The Decime and Fall of the Roman Empire, 1766-1788.

Honorius I., pope (625-37), succeeded oniface V. He wrote a letter to Edwin, Honorius I., pope (1920-31), successive Boniface V. He wrote a letter to Edwin, king of Northumbria, urging him to be true to the new faith, and at his request conferred the pallium on the bishops of York and Canterbury. The Celtic Church was a source of continual anxiety to him, as it failed first of all to acknowledge his supremacy, and secondly continued to observe Easter according to a rule for fixing that time that Rome had discarded. ing the time that Rome had discarded, and in its own way. H. also corresponded with Sergius, patriarch of Constantinople, who maintained that the twofold nature of our Lord was animated by a single will.

our Lord was snimated by a single will. If supported this heresy, which was called Monothelism and was anathematised, with the Monothelite heretics, by the Council of Constantinople in 638. See J. Chapman, The Condemnation of Pope Homorius I., 1907.

Honorius II., pope (1124-30), was Cardinal Lambert Scannaberchi, bishop of Ostia, before his election to the papal chair. Besieged by Roger, count of Sicily, in Benevento, H. atterwards countenanced his investiture as duke of Apulla and Calabria. He excommunicated Conrad, Lothair's rival for the throne of Conrad, Lothair's rival for the throne of

Italv.

Honorius III., pope (1216-27), was Car-dinal Cencio Savelli before he succeeded Innocent III. A zealous supporter of St. Dominic, he failed to induce Frederick II. to lead a crusade against the Muslims, and to lead a critisade against the Musilins, and was so unpopular at Rome that he was repeatedly driven beyond that city's gates. See monograph by J Clausen, 1895, and A. Keutner, Papstum und Krieg unter Honorius III, 1935.

Honorius IV., pope (1285-87), was Cardinal Giacomo Savelli. He favoured thules of Anion, and actually problemed

(inal Glacomo Savelli. He favoured (hailes of Anjou, and actually proclaimed his expedition against the men of Aragon a boly war. See M. Prou (ed.), Les Rignstres d'Honorius IV, 1849 Henour, legal description of a seigniory

of two or more manors under the control of one baron and subject to a single juris-

diction. See MANOR. Honour, Maids of, see HOUSEROLD. ROYAL.

Honourable (from Fr. honorable, and Let honorabiles, deserving honour), title of honour prevalent in the United Kingdom and her colomes and also in the United States. In the United Kingdom marquesses should be addressed as 'most II.'; earls, viscounts, barons, and privy councillors as 'right H.'; whilst the title councillors as 'right H.'; whilst the title of IF. is received for maids of honour, judges of the high court, and the sons and daughters of poers. Formerly the style was loosely applied. Major-gen. Lowther, whose father was a merchant, is described on his tomb in Westminster Abbey as 'The Hon.' (1746). In America and the colonies judges and members of state legislatures of the executive councils have

Honourable Artiflery Company (H.A.C.). As a military force this is one of the most auct, in the world, having been granted its Charter by Henry Vill. in 1537. At this time 'artiflery' included every kind of missile, and this company was a Guild of Arthur This Could become a training Archers. This Guild became a training Archers. This Guid became a training school for the London Train Bands, and was always in the foretrout of military training units. Many famous people have served in its ranks at various periods, including the poet Milton, Marlborough. Wren, and the great Fr. engineer Vauban.
The Corps served in the S. African war
1899-1902, and during the First World
War it raised three infantry battalions and seven batteries of artillery, which served in France, Fleuders, Italy, Palestine, and Aden. Its King's Colour is unique, in that it is the only King's Colour in the Brit. Service which bears all the battle bonous, these being usually on the Regimental Colour. The headquarters of the H.A.C. are at Artillery House, Finsbury, London. An Amer. off-shoot of this Company is the present 'Anct. and House he are the company of the Company is the present 'Anct. and Honourable Artillery Company of Boston, Massachusetts, founded in 1683 by four members of the H.A.C. who emigrated. In the Second World Was the 12th (H.A.C.) Regiment, Royal Horse Artillery took part in many battles on the It. front, 1944-45. Set Maj. G. Goold-Walker (ed.). The Honourable Artillery Company in the threat H ar 1914-19, 1930.

Hontheim, Johann Nicholaus von (1701–1790), Ger. Listorian and theologian, eduvas dean of St. Simeon's in Trier, his native place, and from 1738-47 represented the interests of the archbishop-elector at Koblenz. From 1748 he was also uffragan bighop of Trier, and he was also pro-chancellor of the univ. Under the pen-name of Febronias, he discussed the limits of papel authority in what became a famous treatise. His three hists, of Trier are in the highest degree erudite.

Honthorst, Gerard van (1990-1654), Dutch painter, has left many pictures which are now to be found in many gallettes of Europe. B. in Utrolit, he studied under Abraham Bloemaert, studied under Auraham Bioemaert, nigrated to Rome, where he executed his masterpiece 'Christ before ('alaphas,' In Whitehall, as in the Palace of The Hagne, etc., he painted allegorical subjects, and there are still in existence many excellent there are still in extraord, as, for example, the 'Counters of Bedford' in Woburn Abbey ite is noted specially for his night studies.

Hentrop, coal mining vil. of Westphalia, Germany, in the dist, of Arnsberg.

Bloaved (Land-defenders), term first used under the early monerchy of Hun-gary to describe the national champions. During the revolution of 1848 it was used of the patrictic party, and after independence was estab (1868) was applied to the Landwehr. In 1918 it was applied to the

was held in small esteem by his contemporaries. A pupil, perhaps, of Rembrandt, whose style has left an impress on his work, this artist has left a few, but, in their way, exquisite pictures of native interiors. His chan and cheerful course interiors. scenes intimate an earnest appreciation of the joys of domestic life and a warm love for sun and light. See Von Hostede de Groot, Catalogue raisonné 1907; E. Fro-mentiu, Masters of Past Time (trans.), 1910.

Hood, Sir Alexander, see BRIDPORT, VIN-

COUNT.

Hood of Avalen, Arthur William Acland, Baron (1824-1901), Eng. admired, entered the navy in 1836. During the Crimoan war he was with the naval brigade before Seleastopol, and in the China war parti-cipated in the action of Fatshan Creek (1857) and in the scizure of Canton (1858). Director of Naval Ordnance (1869-73), he flually rose to the rank of First Sea Lord of the Admiralty (1885), when his con-servatism proved a formidable obstacle

to crying reforms.

to crying reforms.
Hood, Sir Horace Lambert Alexander (1870-1916), Brit. rear-admiral; b. in London; 3rd son of 4th Viscount II. Calet at age of twelvo. Lieutemant. 1890 on the Trafalgur, 1891-92. Until 1895 studied gumery ashore and performed staff duties. His first experience of mer was under Experience. of war was under Egyptian gov. in gun-boat on Nile, 1897. At Athara and Om-durman. Commander, 1898. Captain, durman. Commander, 1898. Captala, 1903. Shore-fight, Somailland, 1904. Commanded college, Osborne 1910-13. Reuradural, 1913. In command of Dover idellia that secured Eng. Chaunel on outbreak of the First World War. While ably assisting Beatty with a battlacture squadron in Jutland fight, periabed in wreck of his flagship the Javing of the way was regarded by a captaled by a cille, whose magazine was expluded by a Ger. shell, May 30. See J. S. Corbott, History of the Great War, Naval Operations, 1923.

Hood, John Bell (1831-79), Amer. soldier, graduated from the military academy at West Point in 1853. On the declaration of Civil war he joined the Confederates, and after the battle of Gaine's Mill (1861) was promoted to major-gencral. At Gettysburg (1962) he was wounded and after the battle of Chickamanga (1863) lost one of his legs by amputation. Disaster attended him on winning the temporary command of the Tenmovee army, and at the Battle of Nashville his forces were utterly overwhelmed

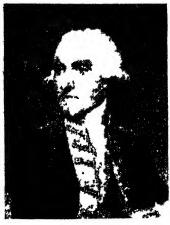

(1865).

(1865).
Hood, Robin, see Robin Hood.
Hood, Samuel, Viscount Hoed of Whiteley (1721-1516). Belt, admiral, sen of a elergyman and brother of Alexander Hood, first Viscount Bridgorf (q.v.), entered the navy in 1741. Frem 1780 to 1753 he was fighting in the West Indies, at first under Rodney, but afterwards as commander-in-chief. In 1781 he made an uneversestil attempt to prevent the Fr. admiral, De Grasse, from blockading whole srny.

Heach, Pieter de (1632-81, or later), thesapeake Hay, and the following year

Dutch painter, b. near Retterdam, workedt is siled likewise, in spite of adroit manat Delft. Like Hobberna and Cuyp, he couvres, to dislodge the Fr., again under

De Grasse, from the is, of St. Christopher The tartics he adopted in extracting him self from this engagement have again and again been commended by naval experts Finally, he assisted at the discounting of his old enemy in the action off Dominic (1783). In 1784 he was returned to Parliament, the unsuccessful candidate being none other than Fox. During the

SANTEL LIBRE VISCOUNT HOOD

Napoleonic wars he succeeded in occupying Corsica (1794) He was received viscount in 1796 and made governue of Greenwich Hospital vis J. H. Hose Greenwith Hospital See J. H. Rose Lard Hood and the Defence of Loudon, 1922

Hoad, Sir Samuel (1762-1911), kng vice admiral, joined the navy in 1776, and from that year till his death was on active service aimost without remission. He took part in the action off Ushant (1775) for the next two years he was flating in the W Indies, and in 1791 effected a branch of the was flating in the W. Indies, and in 1791 effected a branch of the was flating the way flating the way for the rescue of some ships rocked sailors outside the harhour of Jamaica. As commander of the Valous he distinguished himself for his intrepidity and promptitude at the battle of the Mile (1797). In 1842, being promoted to commodore, he almost drove the Fr. out of the West India, and in 1895 seized four Fr. Irigates near Rochefort, but this action unfortunately cost in 1608, he was publicly decorated by the king of Sweden for his brilliant seizure of the Russian gun-ship Senolod. Useful reforms followed his promotion to commander-in chief of the Kast Indies

Tiood, Thomas (1799–1815), King, poet, b. in London of Scottish descent, ultimateto the London Magazine at the age of twenty two, and through this connection it little Second World War, the show ship

he made acquaintance with many of the leading writers of the day He pub Whims and Oddites (1826), and began to publish his Come Annual four years later He was abroad from 1835, but acturned to England in 1840, and in the following year took up the editorship of Colburu's New Monthly Magazine In the year before his death he started Hood's Magazine, and issued Whompiculshes. His works were collected by his sen and dang for (1882-51). Has best known as a humor-191 and as such he occupies a very high place in Eng letters. He was anduly place in Eng letters. He was anduly addicted to the use of the pun, a now disciedited form of wit, but he had a happy way of playing upon words that redeems his jokes from the charge of sillines. I hough prin arily a humorest, he could write in other veins. The Dreum of will in other veins, The Dreum of Fugin trum (1839) is one of his most famous points, second only to the pathetic and be utiful Bidge of subs. The Song of the Shirt, pub anonymously in Punck in 1413 ittracted as much attention to the lot of the worker as Oliver Purst did to the abuses of the workiones system. The Memorials of Thomas Hood, by his daughter, appeared in 1860 and blogithm is by W. Jerrold in 1907 and W. H. Hinkon in 1915 See also W. Jeriold, thomas Hood and Charles Lamb, the story

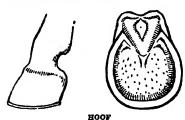

of a friendship, 1930
Hood, part of actionic dress. It is a development of the monk's cowl, and indicates by its colour retterns, and shape, the faculty in which the owner has graduated, the status to which he has attained, and the mire to which be be-

COOR PURDIN

Hood, Mount, extinct volcano, 11,225 ft. high, belonging to the Cascade Range, in the N E. of the Checkamas co. of Oregon, -. A 18 situated of m E of Portland Pines and fire cover its lower slopes. one side is a sheer descent of 7000 ft.

of the Royal Navy. She carried a heavier armament than any other ship in the Fleet with the same speed. Begun in 1916, launched in 1918, and completed in March, 1920. Her displacement was 42,100 tens and her speed was over 30 knots. The original cost was about £6,025,000 but a further £687.674 waspent on repairs and reconstruction when she was taken out of commission in 1929. She was again refitted in 1939. Her outstanding features were the huge area covered by heavy armour, strong framing and the general scheme of protection. Her eight 15-inch guns fired a shell of nearly 2,000 ib., their extreme range being 17 m. In addition there were twelve 5-5 inch guns, as well as lighter armament. The stip was sunk off Greenland by a shell from the new Ger. battleship ment. The slip was sunk of Greenland by a shell from the new Ger. battleship Bismarck at 13 m. range, the shell penetrating a magazine so that she blew up and sank in a few minutes (May 24, 1941). The end of the H. was an almost unbelievable nightmare to the Brit. public and an almost inexplicable disaster in naval hist. Of her complement of over 1300 only 3 were saved. See further under BISMARCK, THE, and NAVAL OPERATIONS IN SECOND WORLD WAR.

Hoofs are horny boxes which protect the sensitive parts of the foot of an animal. The possession of H. is a distinction on which the large order Ungulata is based. They are equivalent to the claws and nails of other mammals, and are renewed from the superior to the inferior border like the human nail. The flexibility of the H. is promoted by a fluid secreted by the kera-togenous (horn-producing) membrane. The so-called cloven H. has been evolved for walking and climbing on irregular surfaces by the formation of separate digits on the foot, each bearing its own distinct H. The horse's H. is too brittle for road wear, and the art of shooing was practised

as early as 333 B.C. Hooit, Pieter Corneliszoon (1581-1647), noted framatist and historian, is, perhaps, after Vondel, the greatest literary genius Holland has to far produced. Born in easy circumstances—his father was for some time burgomaster of Amsterdam—H.

pastoral Granida (1605), his tragedy Geerardt van Velzen (1612), and his monu-mental Nederlandsche Historien 1855-35 (1642-54). See G. Brandt. Leven van P. C. Hooft, 1677; Sir E. Gosse, Northern Studies, 1879; and P. Prinsen, P. C. Hooft, 1922.

Hooge, tn. just E. of Ypres in Flanders. Its situation caused it to be involved in most of the operations around Ypres in the First World War. In May 1915 heavy the First World War. In May 1915 heavy Ger. attacks were launched against the E. and N.E. fronts of the Y pres Salient, and by the 9th the Brit. line had been pushed back to Hooge on the E. Later in the month the Gers. gassed the place and secured a footing in it. During the Ger. offensive of April 1918, H. was again the scene of much fighting, but the Ger main effort was against the S. portion of Ypros more than the E. In the Allied counter-offensive the Ger. positions at H. were overrun by the Brit. (See also France and Flanders, First World War Oam-Paidy-11.) PAIGN4 IV.)

Hoogstraten, Samuel D. van (1627–1672), Dutch painter, b. at Pordrecht, studied in the school of Rembrandt. Hereme proyect of the min at Pordrecht.

studied in the school of Rembrandt. He became provest of the mint at Pordrecht, 1871. Good examples of his rare works being in Amsterdam and Vienna.

Hook, James Clark (1819–1907), Eng. nainter, studied at the Royal Academy, and in 1846 set out on his foreign tour, as the Academy had awarded him the travelling studentship for his 'Rizpah watching the Dead Sons of Saul' (1846). So far he had mostly chosen romantic or historical subjects, like 'The Finding the Body of Harold' (1846). But after his return from Italy and Paris, he embarked on his spiendid series of Eng. see and land on his spiendid series of Eng. sea and land scapes, among them being: 'A Rest by the Wayside' (1854), 'Luff Boy' (1859), which Ruskin so much admired; and 'Sea Urchins'. See A. J. Hook, Life of J. C. Hook, R.A., 1932.

Hook, Theodore Foundations (1932)

Hook, Theodore Edward (1788-1841), Eng. dramatist, journalist and novelist, b. in London, son of James H., a music-hall composer and composer of *The Lass* of *Richmond Hill*. Educated at Harrow; of lichmond Hill. Education at narrow; but his father, having discovered hisson's precoclous gifts as an author and composer, took him away from school so that he could practise them at home. This occupation was interrupted for a term or constitution of the control of the con two at Oxford, but univ. discipline proved uncongenial and H. returned to London Hooft, Pieter Corneliszoon (181-1647), uncongenial and H. returned to London Dutch dramatist and historian, is, perhaps, after Vondel, the greatest literary genius Holland has so far produced. Born in easy circumstance—his father was for some time burgomaster of Amsterdam—H. spent over three years travelling in Italy and Germany, and after studying law and hist, at Leyden Univ. (1606-09), received a highly remunerative appointment from the prince of Orango. The value of his European culture is manifest in his fine treasurer at Mauritius at a salary of \$3,000. This windfall was H.'s ruin. After five years of brilliant sectal success, he was accused of peculation and sent home under arrest. The attornov-general, however, ruled that there were no grounds for criminal proceedings and H was rulessed He found employment. no ground for criminal proceedings aim.

It was released. He found employment in starting and editing a high Tory weeky paper, John Bull, in which disgraceful attacks, written by himself, were made on Queen Caroline and her Whig adherents. When his identity became known the Whigs were not slow to take vengeance:

To though the neculation in Mauritius for, though the peculation in Mauritius was the work of a subordinate, it was found by a board of enquiry debtor to the Crown for £12,000 through gross neglect Crown for \$12,000 through gross neglect of duty and he was imprisoned for debt from 1822 till 1925. In the last sixteen years of his life, besides journalistic writing, he pub. 38 novels. These attained a popularity second only to Scott's now, unread and well-nigh unreadable, they are of interest only to the literary historian for their considerable influence on the early work of Dickens. Wrote The Schler's Between a coulc opers. 1895. on the early work of Dickens. Wrote The Soldier's Return (a comic opers. 1805), Catch Him who Can (also an opers. 1806). Sayings and Doings (3 series, 1826-29), Maxwell (1830), Jack Brag (1836). He was editor of The New Monthly Magazine from 1836 until bis deuta and had the honour of being satirised by Disraell and Thackeray. Though making a lesso in-Thackeray. Though making a large ininackersy. I long making a large income he was always in difficulties and, after a long struckle with broken health and spirits, he died at Fulham. By the testimony of all who knew him, from Coleridge to Barham, the charm of his conversation was irrestable and unfailing. conversation was irrespectible and unitaling, and his powers of memory and improvisation phenomenal See R. H. Barham, The Life and Remains of Theodore Hook, 1819; M. F. Brighthield, Theodore Hook and his Novels, 1928, and A. Repplier, The Laugh that Failed, 1936.

Hookah (from Arabic hugga) or Nartleb waters to be accounted to poullar in India.

Hookah (from Arabic huqqa) or Nargileh, water tobacco-pipe popular in India, Persia, Turkey, and other countries of the E. The tobacco bowl is connected by a wooden tube with a water vessel so that the smoke is cooled in the liquid before passing through a floxible tube up to the smoker's mouth.

Hooka Repart (1825-1793) Eng. physically a significant of the smoker's mouth.

Hooke, Robert (1635-1703), Eng. physicist, b. at Freshwater, in the tele of Wight, was a pupil of Dr. Busby at Westminster; and at Christ Church, Oxford, worked in the laboratory of Robert Boyle. In 1661 he taught geometry at Gresham Collego, and in 1677, after being surveyor to the City of London, became secretary to the Royal Society. From a paper read before the Royal Society in 1681 it is evident that H. had brought the theory of the telegraph to a much more advanced stage than the Frenchman, Guillaume Amontons (q.r.), and nearly twenty years sooner. Yot although the method of accomplishing telegraphic communication was clearly oxthe laboratory of Robert Boyle. In 1661 graphic communication was clearly explained by H. and its practicality domonstrated by Amontons, it continued to be regarded as of no practical value and was only applied to useful purposes a century later. The range of his invention was

phenomenal. Among his contrivances were a double-barrelled air-pump, the spirit-level, arcometer, marine barometer, the balance-spring of watches, the anchor-escapement of clocks, and a sea-gauge. He was one of the earliest workers with the microscope; his Micrographia (1667) contained the first description of plant contained the first description or plant cells, as well as many other accounts of microscopical anatomy. H.'s Law in physics is named after him. His regretable quarrel with Newton arose out of the fact that he believed, rightly it seems, that he had alroady discovered certain of his rival's principles, especially as to gravity and the laws which rule celestial motions. motions.

Hooker, Sir Joseph Dalton (1817-1911), Eng botanet; b. at Halesworth, Suffolk; son of Prof. Sir W. J. Hooker; took his M D. degree at Glasgow (1839), and as assistant-surgeon accompanied Sir James Ross to the Antarctic in the Erebus. His foreign tours were all fruitful in scientific forcign tours were all fruitful in scientific and especially botanical discoveries, which were fully described in his Flora Interctica (1841-17), Flora of British India (1874), etc. In 1865 he succeeded his father, also an eminent botanist, as director of Kew Gardens. A friend of Darwin, he championed his theories in his presidential address to the Brit. Association, 1868. President of the Boxel Section 1872-77

dress to the Brit. Association, 1868. President of the Royal Society, 1872-77. Other pubs. wero a Himulayan Journal (184) and Genera Plantarum (1862-83). Awarded O.M. in 1907. See monographs by L. Huxley, 1918, and F. Bower, 1919. Hooker, Riohard (1553-41600). Eng. theologian, was, through the patronage of two bishopy, able to take his M.A. degree at Corpus Christi, Oxford, in 1577. For some time he was tutor to George Cranmer. grand-nephow of the archbishop, and mer, grand-nephow of the archbishop, and Edwin Sundys, son of the bishop of Loneavin sanays, son or the bishop of London, and later became master of the Temple, whence his more popular rival. Travers, the Puritan, was eventually expelled. The eight books of the Laws of Ecclesiastical Pulity were composed within the cubet of a country vice see in the quiet of a country vicarage. Five books only were pub, in his lifetime, and considerable my-tery attended the pub. of the last three during the half century following his death. The standard edit, is that of Keble (1836), to which the inlimitable life by I. Walton (1666) is fitly appended. In spite of its quaint and somewhat archaic flavour, H. work, by gension of the statistics and observe the reason of its statelines and charm, its lucidity, even where the thought is most profound, and its noble expression of a lofty intellect and unswerving religious enthusiasm, is justly deemed the fountainhead of modern literature in prose. His head of modern literature in proso. His theory, which he gradually unfolds from book to book, is based first on the unity and omnipotence of law, 'whose seat is the boson of God,' and secondly on the supremacy of calm and temperate reason, to which all things, even divine revelation, are finally reforred. See V. Stanley, Richard Hooker, 1907, and L. S. Thornton, Il Hooker, a Stanley of his Theology. R Hooker, a Study of his Theology, 1921.

Hooker, Thomas (c. 1586–1647), Amer. divine, b. in Martield, Leicestershire, Eng-

Preached in London and Chelmsford (1629); at the latter th. Land, hishop of Lendon, dismissed him for noncon-formity He went to Holland (1630) and formity 416 went to Holland (1630) and in 1631 enigrated with John Cotton and Samuel Stone to Boston, U.S.A., appointed pastor at Newtown (now Cambridge, Massachusetts); and in 1636 he founded Hartford, which he named after tounded Harkford, which he handed after the bp. of his assistant, Samuel Stone, Some of his works include A Surrey of the Sum of Church Duscipline (1614), The Soul's Implantation (1641), The Application of Redemption (1646) See life in C Mather, Mognatius Christic Cimerican, 1702: and M. It rises in the Pyrenees Mts and flows in a

it riess in the lyrenees and and nows in a generally southern direction to the Indian Ocean at Warrnambool. Only about 5 m. are navigable. Length, 110 m.

Hopkins, Essk (1718–1802), Amer. naval officer, b. in Scituate R.I.: appointed by Congress, 1775. First Commander-in-Chief of Amer. navy with title of admirst. He was dismissed for allowof admiral. He was dismissed for allow-

ing the (llasgou to escape.

ing the Hangor to escape.

Hopkins, Sir Frederick Gowland (1861–1947), heramo prof. of blochemistry (1914) in the univ. of Cambridge, and Sir Wm. Dunn prof (1921). For his brilliant work in blochemistry he has received sev. awards, including part of the Nobel prize for medicine in 1929. In 1892, H. devised a reliable and comparatively simple vised a reliable and comparatively simple method, still in general use, for the estimation of uric acid in urine. H. had not been long at Emmanuel College, Cambridge (which made him a supervisor of its medical students), when he made in 1901 the first of his great discoveries: in col-laboration with S. W. Cole he isolated and identified the amino-acid tryptophane.

In 1902 a univ. readership in Chem. Physiology was created for him; and he only gave up his posts at Emmanuel College in 1910 when Trinity College elected lege in 1910 when Trinity Context crowsea thin to a praelectorship in Physiological Chem. with a fellowship. In 1914 a professorship of Blochemistry was created for him, to terminate with his tenure of office; in 1921 he became the first Sir Wm. Dunn Prof. of Blochemistry. The results Dunn Prof. of Biochemistry. The results obtained by H., working first with Fletcher (1905-06) and later with Dixon (1921), revolutionised the conception of the source of muscular energy and exidation of tlesues. The earlier work, howing the formation of lactic acid during nuscular contraction in the absence of oxygen, and the presence of mere traces of this product in the resting muscle and during contrac-tion in the pre-ence of oxygen, led to the abandonment of the theory of storage of intramolecular oxygen. Later, H and Dixon isolated glutathione, a constituent of plant and animal tissues, and showed that other cell products reduced this substance immediately it was oxidised. Glutathione was therefore regarded as the centre of autoxidation in the cell. H. was the first to show that life could not be maintained on protein, fat, and carbohy-drate alone, but that accessory food factors were essential. He thus initiated the research on vitamins and helped to show their importance in bone formation. (See VITAMINS.) In addition to these (See VITAMINA.) In addition to these important contributions to physiology and dietetics, H. discovered and investi-gated the biological rôle of many other compounds including pterins, a chemical group identified with the pigments of butterfly wings, of importance to bio-chemistry. He received the Royal Medal of the Royal Society in 1918 and the Society's Copley Medal in 1926. In 1931 he was elected President of the Royal Society In 1933 be was President of the Brit. Association. Awarded the Baly Medal of the Royal College of Physicians of the Royal College of Physicians in 1915 and in 1921 was Vice President of the Chem. Society. In 1928 he was given the Society of Apothecaries Medal and in 1931 was awarded the Albert Medal of the Society of Arts. ().M. 1935.

Hopkins, Gerard Manley, (1844-1889), Eng. poet and one of the most original of the poets of the second half of the nine-teenth century. Went to Balliol College, Oxford, his tutor being Walter Pater, and entered into the Rom. Catholic Church, but, on the advice of Cardinal Newman, but the Both of the Control of the Second Inc. 1866 he finished his studies at Oxford. In 1866 he joined the Society of Jesus and eleven yours later was ordained priest. Before Before entering on his religious vocation H. decided to eschew poetry, but after seven years, at a hint from a superior, he resumed his muse by writing a com-memorative poem on the Franciscan nuns lost in the wreek of the Deutschland—the iost in the wrek of the Deuschland—the poem being rejected by the Month (1876). If the poem was considered advanced forty years later, it is small wonder that it was rejected. His poot friends, Bridges and Patmore, felt some extrangement from his etvie: but despite the doubts of his friends, he clung to his alliterative metres and his artificial compounds—the 'lovelyasunder starlight,' and the 'silk-sack clouds.' The background to most of his cities and tue in England. Yet he was more concerned with being a prescher than a poet, and his letters show how much his poetry was an overcoming of fatigue. His last poems belong to the few remaining flis last poems belong to the few remaining years of his short life, when he taught Ck. and Lat. in Dublin after his election as a Fellow of the Royal Univ. in 1884. But his health was then declining and his imperfect sympathy with Irish politics added to his unhappiness. He was nearly thirty years dead before his poetry was pub. In 1918 the single vol. that contains it was brought out by his Oxford stand Edward English. But the first oil. friend, Robert Bridges. But the first ed of under one thousand copies took twelve years to sell and whether he will ever be widely read is much to be questioned, though fame has not furled him and he is a poet who should eventually receive his due place in the hierarchy of England's major poets. The poetry of H. in metrical form and imagery, shows the influence of Keats This is evident in the heautiful poem A Vision of the Mermauds (1862). More mature, but not more inspired than this mature, out not more inspired than this remarkable effort of his youth, are Ad Mariam, in the style 'Swinburne' Winder with the Gulf Stram, Line for Preture of St. Dorothea, Maryaret Clifferoe, Wind Lover Heaven-Haven, Pied Beauty, I have descred to go, Felix Randal and the Habit of Perfection—the last six being among his best poems. His name figures in every study of contemporary regres in every sound in community werse as that of a major poot, but noticitle less a poet's poet. An excellent analysis of his poetry is to be found in the chapter. The Craftsman in G. F. Lahey, Gerard Manley Hopkins, 1930. See also R. Beldere, at A. Poetro of Gerard Manley Hopkins. Manley Hopkins, 1930. See also R. Bridges (cd), Poems of Gerard Manley Hopkins, with introduction by C. Williams), 1930. Eleanor Ruggles, Gerard Manley Hopkins, 1947, and W. A. M. Peters, ferard Manley Hopkins a critical Lessy lineards the Understanding of his Poetry 1948.

Hopkins, Harry Lloyd (1890–1946)
Amer. social reformer politician and administrator, b. at Sloux City, Iowa, U.S.A., of comparatively humble parentage. Educated at Grinell College, Iowa While will at college he decided on a social service.

still at college he decided on a social serstall at college he decided on a social structure career and, in 1914, was put at the head of the New York City Board of Child Welfare. Defective eyesight produded military service in the 1914-18 war and he joined the Red Cross, kerving war and he joined the test Cross, thiring it in 1922 to become assistant director of the New York Tuberculosis and Health Association, in which caps ity he attracted the notice of Franklin Roosevelt then Governor of New York State Roosevelt made him acting director of the New York State Roosevelt made him acting director of the New York State Roosevelt made him acting director of the New York State Roosevelt Roos York State Temporary Emergency Roller Administration and, after his election as President, Federal Roher Administrator, in which capacity H. spent 39 m. in rollevin which capacity it. spont so in. in concern a fing unemployment, especially by building in titune. This he dipublic works on a nation-wide scale it philanthropic purpulsas during these years at Washington Bultunore with a public that H., who was in close touch with the White House, became the close friend of wards a free hospital.

Roosevelt. In 1938 the President appointed him Secretary of Commerce and when in 1940, ill health compelled his retirement from the poet, ill had won a wide measure of confidence among business men. By the time of the Democratic Convention of 1940 H had sufficiently recovered to work at the White House, becoming a resident there and a member of the Roosevelt household, Later, as virtual secretary to the Inner War Cabinet. H, became pursonal assistant to the President and his closest confidant. to the President and his closest confident. in Jan 1941, Roseveit sent him to Loudon as his personal emissary and later to Stalin in Moscow. In the same year the president made him head of lend Lease Administration. When the 1 the Lease Administration. When he is a true of the war, I was appointed an adviser on strategy and war supplies and, soon afterwards, chairman of the Munitions Assignment Board Member of the l'acthe War Council, 1942. After 1000-volt's death, H. again went to Moscow as President Truman's envoy and was instrumental in the partial solution of was instrumental in the partial solution of the difficulty on the veto which had arisen at the can francisco Conference (q v). The strain of the Moscow journey, however, on his health prevented him from attending the meeting of the representa-tives of the three major allies in Berlin in July, 1941, and from Nov. he was a patient in the New York Memorial Hos-pital, dving on Jan. 29, 1946. His was truly a remarkable cureer. From an earnest and single-minded social reformer earnest and single-inities social reformer he issume one of the leading adminis-trators of the New Deal (q.v.) and a trusted emissury on diplomatic missions of the highest importance. Despite ill health he accepted in the early stages of the war, the most onerous responsibilities, instilling a confidence in the goodwill and power of his country which was a source of immense inspiration to its alies. In Sept. 191, he received the Amer. Distinguished 193 he received the Amer Distinguished Solvice Medal, the citation speaking of the exceptional ability he had shewn in 'welding our allies to the common purpose of victory over agression.' See R. Sherwood (ed.), The White House Papers of Harry L. Hopkins (vol. 1), 1948.

Hopkins, John (d. 1570), Eng. hymn writer, was part translator with Thomas Strinhold of the famous metrical version of the Papers.

of the Psalms. Of the complete ed. which appeared in 1562 sixty pealing bore the name of H, and forty that of Sternhold. H also contributed some commendatory verses to Fove's Acts and Monuments, and

reves to Fove's Acts and Monuments, and soften credited with the authorship of the Old Hundredth.' He was rector of Great Waldangtield Suffolk (1561-70). Hopkins, Johns (1795-1873), Amer. phaenthropist b. in Anne Arundel co., Marsland. His Quaker parents educated him for a farmer, but at the age of seventicu he went to Baltunote and became a recess. grocer, eventually founding the house of Hopkins & Brothers, and amassing a large fortune. This he devoted to various philanthropic purposes, he presented Baltimore with a public park, founded the Johns Hopkins Univ., and gave money to-

Hopkins, 1930. Hopkins, Samuel (1721-1803), Amer. theologian, b. at Waterbury, Connecticut. He studied under Jonathan Edwards, and in 1/43 was ordained at Housatonic, now Great Barrington, Mass., where he con-tinued until 1769 when he became minister of Newport, Rhode I. He was an oppo-nent of slavery, and in 1776 pub. Dralogue showing at to be the Duty and Interest of the American States to Enuncipate all their African States. His System of Doctrines contained in Dimne Revet thin, Explained and Defended (1793), sets forth his theological opinions, which differ from ortho-dox ('alviniam in their opposition to the acctrines of original sin and of the Atonement. The pub. of his views was the cause of the famous 'Hopkinskin controversy.' II, is the central flaure in Mrs. Stowe's novel, The Minister's Wooing, (1859). See hite by S. West, W. Walker, Ton New England Leaders, 1901: and B. Dexter, Biographical Sketches of Yale College, 1907.

Hopkins. William (1999)

Hopkins, William (1793-1866), mathematician and geologist, b. at Kingston in Derbyshire. He entered Peterhouse, Cambridge, in 1827, and became seventh wrangler in 1827. He settled at Cambridge as a tutor, and was so successful in his work that he was called 'the senior wrangler maker'; indeed, in 1849 he had nearly 200 wranglers among his pupils, amongst whom may be mentioned such distinguished men as Todhunter, Tait, Fawcett, Stokes, and Clerk-Maxwell. About 1833 he began to study goology, and in 1850 received the Wollaston medal for his researches in the application of mathematics to physics and geology. In 1851 he was elected President of the Geological Society, and in 1853 became President of the Brit. Association. His pubs. include Elements of Irigonometry (1833), and Theoretical Investigations on Motion of (Ilacores (1842).

Hopkinson, Francis (1737-91), Amer. suther, h. in Philadelphia, U.S.A. He was educated at the univ. of Philadelphia, and then studied law. In 1776 he was elected representative of New Jersey in for his researches in the application of

elected representative of New Jersey in the Amer. Congress, and was a signer of the Declaration of Independence. He was appointed judge of the Admiralty in Pennsylvania (1779), and judge of the Dist. Court of the United States. H. was versatile writer and was very popular a versatile writer and was very popular during the revolution, when he wrote his famous ballad Battle of the Keys. Its writings include: The Treaty (1761), An Resaing Hynan, Science (1762) A Camp Ballad, The Typographical Mode of Conducting a Quarret, The Pretty Story (1774), The Prophecy (1776), The Political

Hopkinson, John (1849-98), Eng. electrician, b. at Manchoster and educated at Triuty College, Cambridge, where he caduated as senior wrangler. He then took up electrical engineering, and made many important investigations; in 1890 being awarded a royal medal for researches in electricity and magnetism. He was prof. of electrical engineering at King's College, London, at the time of his death. He pub: Dynamic Electrecity and Original Papers on Dynamic Machinery and Albed Subrets (1893), and other papers on similar themes. He was killed with a son and two daughters ascending the Dent de Veisvi in the Alps.

Hopkinson, Joseph (1770-1842), son of Francis H., b. at Philadelphia and educated at the univ. there. He studied law and practised at Easton and Philadelphia. II, was a member of the national House of being awarded a royal medal for researches

II, was a member of the national House of Representatives from 1815-19, and judge of the Dist. Court of the U.S.A. in 1828; he was also vice-president of the Amer. Philosophical Society and president of the Philadelphia Academy of Fine Arts. Ho pub some of his addresses which he delivered before various societies, but he will be chiefly remembered for his song, Had, Columbia (1798). See life by Fran-cis Wharton, R. Griswold Poets and Paetry of America, 1812; and B. A. Konkle, Joseph Hopkinson, 1931.

Hopkinsville, eity of Kontucky, U.S.A., co seat of Christian co, 71 m. S. of Henderson. It is important principally for its tobacco: it trades also in agric, produce, ive stock, coal, and timber. There are also flour mills. The Bothel Women's College is situated here. Pop. 11,700.

Hopping, John (1758-1810), portrait painter, b in Whitechipel, Loudon. He was admitted as a student to the Royal Academy in 1775, and in 1782 gauget the

Academy in 1775, and in 1782 gained the Academy in 1775, and in 1782 gained the gold medial for an original painting of a scene from King Lear. In 1785 he exhibited portraits of the youngest three princesses, sophia, Amelia, and Mary, and in 1789 was appointed portrait painter to the Prince of Wales. In 1795 he was elected R.A. H. acquired some reputation in his own day, especially for his portrait of women and children. His figures were graceful and rutural and his colours. tion in his own day, especially for his por-traits of women and children. His ignres were grace thi and matural, and his colour-ing brilliant and mellow. Some of his best pactures are the group of 'Lady Cal-ling Smith and Children' (belonging to the duke of Wellington), the time portrait of 'Mrs. La-celles' (the property of Lord Harswood), both of which were exhibited at the Royal Academy, 'The Countess of Oxford' (National Gallery, London', William Putt' and 'Lord Gresnville' (National Portrait Gallery, London', William Putt' and 'Lord Gresnville' (National Portrait Gallery). See W. Vinckay and W. Roberta, Lifegand Paint-ings of J. Hoppner, 1909. Hops (Humulus lupulus), perennial her-baceous plant belonging to the order Can-nabinacee, which has long twaining steams which climb fruely over hedges and bushes. Its leaves are stalked and three to five lobed and very rough to the touch, the

plant being of luxuriant growth and abundant foliage. The male flowers consist of a small five parted perianth enclosing five stamens, and grow in loose all lary panishes. The female flowers are in strobles, or cones, and it is these ripraed cones which are sold under the name of il so that female plants are most generally planted a few male only being necessary to fertilise the female flowers. The H to fertiline the female flowers first mentioned by Pliny as being a garden plant of the Roms who were in the babit of eating the young shoots as we ent asparagus (indeed in Belgrum the young tender tops are even now cut off in spring and used as food the plant being forced from lier to beb for that purpose), and as early as the eighth and ninth centuries H. gardens (humularia) were cultivated in France and Germany for the manuf of beer, but up to the sixteenth century the plant seems only to have been grown in a fifth manner. It was introduced into Emgland from Planders in 1245 but did not become suffice at for the supply of the not necome sunici at for the supply of the kingdom till the end of the seventeenth century. The chief cos concerned with H production in linghand are kent, Here ford, Sussex, Wolcester Hants, and Surrey, and of these kent has always taken the lead, and includes about two thirds of the left sevent of the left lakes. the H acreage of the Brit Isles indeed out of 41' pars in the count 3' have H plantations These are prepared in Oct and Nov the cuttus ploughed dug and manured (for a not soil is required) and the plants put in in rows 6 ft apart Later they are poled and dicesed, the former being due in various wave and at various times—some owners pole the ir plants the first year to produce II in the first season, but is a rule planters nurse their young plants for twelve months as they make very little growth the first year. When the cones are tipe are have become amber coloured and firm, they are picked and conveyed to the oast house to be dried, great care is required to prevent over heating, by which the essential on would be volidised. The cultivation of H is very precarious as the plant suffers from various pests, both insect and fun gold parasites of the former the red spider, Tetramychus telarius, is most de structive in very hot summers, and of the latter the fungus Podusphara costagner does much mischief to the cones See D Skilbock, Hops, 1931 See also Bri wine

Hoquiam, tn., Washington, U.S.A., co seat of Chehalis co., I.S.M. W. of Monte same. It is surrounded by tumber lands It has large lumber and shingle inflie, also plywood and vener plants. It ships lumber, fish, and furs. I arming and dairying are also carried on. I here are shipyards and a fine har hour. Pop. 10,800

Horace, Quintus Horatus Flaccus (62-8 B.C.), Hom poet, b at Venusia in Apulia. He was of servite descent but his father had acquired the status of freedman, and from his profits as anctionaur's collector had been able to purchase a small farm at Venusia. One of the most endearing traits in the character of H. is his reverence for his father. H.'s father recognised the genus of his son and, comparatively

poor though he was, he contrived to give him the best education obtainable by a Roin youth He therefore declined to send the boy to a prov school, and had him educated in Rome at the school of Orbilius, where the sons of knights and senstors were trained. The father himself acted as where the sons of knights and senators were trained. The father himself acted as attendant on the bow accompanying him to whool In H's time many Rom. youths received their univ training at Athens, and theire II repeared about the age of twenty. When Brutus wents to Athens to key forces against Octavian, H embated in his service and was given the raps of military tellura in command. the rank of military tribune in command of a legion. He was on the field at Philippi, and his depicciation of his own valour must be regarded as an imitation of Archilochus and Alcaus, and not as scious information (Odes, II vit. 9; I motte II n 46-30) In the land settlements after the war, H s paternal property at Vennsla was confiscated and he be-Rome Varius and Virgil introduced the coung poet to Mecense, who became his life long patron and friend Ma cenas, n turn introduced him to Augustus, who soon to the glory of Rome and the fame sorn to the giory of Rome and the fame of his protege, chilsted but services to your the ideals of his new empire. From the time it became a court poet, but his genies was strengthened rather than etailed by the guiding influence of his arrent in the year is not Maccines in the year is not Maccines, while throughout the remainder of his the time of the date of the de satisfied his deep scated love of countiv his and scenery I hough towards the cleang years of his life, H was drawn into full timest bosom of the court he never full this former patron. To his fervent. love of Marchae the seventeenth ode of the second book and the cleventh ode of the fourth book bear speaking testmony. Mecenas himself, on his deathbed, thus in nended the poet to the emperor. It rati I lace ut meresto nomor (Suct. m! but H only carvived his patron a few w k. H dued suddenly and without mailing a will, and to Augustus he left the unitie control of his affairs. H 's cardises pul was the first book of the Safara (Bc), followed by a second book c 30 I here follow the chdactic aims and an idea father of the early Salures of I wilms, but they are less personal in attack than the work of the early master. I like the fiere invertie of Juvenal, the it is been written between 41 and 11 BC.

1) are based on the works of Architochus but are sometimes coarse in sentiment and immature in expression. The the watment is mellow, and the workmansip perfect. In subject and style the fer Poetron, a metra il treatme on the act of poetry, is closely allied to the second honk of the Leptstle. This work is somewhat desultory in treatment and capricdons in judgment, its standpoint is un-compromisingly mechanical, vet it throws valuable light on H. s own poetic methods. and the state of literary criticism at Rome.

But H.'s great work was the Odes. These do not stand high on account of any startling originality of thought or depth of feeling, but in finish and technique they those which deal with Rome's expansion and conquests; the love lyrics, although

those which deal with Rome's expansion and conquests; the love lyrks, although charming and graceful, are sometimes in sincere and insipid, and are much inferior to the fiaming lyries of Catulius. The philosophy of H. is eclectic, but, if he inclines to any sect, he is Epicurean and carpe diem is his guiding procept. As a Rom, poet he is generally held to rank second only to Virgil.

Hores (Lat. hora, hour), Ok. mythology, the persontification of the seasons. They are weather-goddesses; the children of

the personification of the seasons. They are weather-goddesses; the children of Zeus and Themis, whose function, it is to regulate the order of nature, superintend agriculture, etc. They are companions of the nymphs and graces, and are represented as goddesses of youthful bloom and grace, typical of the springtime. They are sometimes indicated as being three in number, with parents as above mentioned: but under Alexandrian influence they became the four daughters of Hollos and Selene. See J. H. Krame, Die Musen, Grazien, Horen und Nymphen, 1871.

Horapoilo, or Horus Apollo, Gk. grammarian who taught at Alexandria and Constantinople in the reign of Theodosius. He is often confounded with the Egyptian Horapolic, who lived in the time of Zeno. There is still extant a work by him on

hieroglyphics.

Horatii, three Rom. brothers, chosen by the king, Tullu-Hostilius, to fight against the Curiatii (three Alban brothers) in Longa and Rome. Two of the Roma quickly fell in the combat, but the surviving Horatus was victorious and was led back in triumph to Rome.

Horatius Cocles, Publius, descendant of the survivor of the three Horatii, who, according to tradition, along with Titus Herminius and Spurius Lartius, held the bridge over the Tiber against Lars Por-sens, king of Latium, in 507 B.C. H. sent sens, king of Lathum, in 507 B.C. H. sent back his two companions when the fight was almost finished and defended the bridge single-handed. He then escaped by swimming the Tiber, though enfeebled by wounds, and was overwhelmed with honours by his compatriots. See T. Macaulay, Lays of Ancient Rome, 'Horatius,' 1842. Hordaland, co. of Norway, on the Atlantic coast, with Buskerud and Telemark cos. to the R. Chief tn., Bergen. Area 6.043 sq. m. Pop. 186,900.

Horley, par. and residential vil. in Surrey, England, 5 m. S.S.E. of Regate, and situated on the R. Mole. It possesses an Early Kng. church (St. Bartholomew). Pop. 6000.

Hormayr, Joseph, Baron von (1782–1848), Ger historian, b. at Innshrück. In 1815 he was appointed historiographer of Austria, and in 1828 became councillor for the foreign dept of Bavaria, holding the nesition of Bavarian minister to Hanthe position of Bavarian minister to Hanthe position of Bavarian minister to hab-over in 1832. He whote widely, among his works being: History of Typol (1817, General Hustory of Modern Times (1817), Vienna, Its History and Currosities (1823), etc. See life by T. von Heigel, 1881. Hormones (Gk. opaau, 1 excite) term applied by E. Starling to those Juices pre-paged by organs, who hass directly into

pared by organs, which pass directly into the blood stream, they are transported to some other parts of the body where to some other parts of the body where they exert a controlling and regulating effect on some vital activity. They are often referred to as the 'chemical mea sengers,' of the body. The most highly complex inter relations appear to exist between the glands, so that the effect of a uctive the giands, so that the effect of a drug on one of them is very far reaching W. Bayliss and E. Starling prepared an extract, secretin, by digesting duodenal mucous membran wan hydrochloric acid. The product is soluble in alcohol, and is not destroyed by holling. If secretin be injected into the blood, it leads to active stimulation of the paureas. This is apparently naturally formed by the action of the pair change on some two action of the acid chyme on some pro-secretin in the intestine. It passes to the pancreas, which it stimulates to produce pancreatic juice. Many Hs besides seeietin are now known, most of them produced in ductiess glands (endocrine or gans) The study of these glands, and of their Hs., forms the important branch of medicine known as endocrinology. We meaning known as endorfinding. We may mention thyroxin, formed in the thyroid gland of the neck; adrenalin, secreted by the adrenal glands near the kidneys, and pituitrin, a mixture of many hormones manufactured by the pituitary gland of the brain. The sex organs (testes or ovarise) are also the site of hormone production as a demonstration. organs (testes or ovaries) are and the site of hormone production, as is demonstrated by the striking consequences of castration. Insulin is the H of the pair rus, see D Paton, Hormone Iherapy, 1922, J Cunningham, Hormones and Herechty 1922; B Harrow, and C. Sherwin, J. Cunnington, Hormones and Herenty 1922: B. Harrow, and C. Horn, French, see FRINCH HORN.

Horn, Arvid Bernard, Count (1684–1742), Needish statesman, b at Vuorentaka, Finland. He served in the Swedish army against France and gained rapid promotion, being sent in 1704 as Swedish ambassador to Warsaw, and assisting in the deposition of king Augustus of Poland. In 1705 he became councillor to the new King Stanislans and as bead of the new King Stanislaus, and as head of the party of Bonnets 'practically ruled weden, converting it into a limited mon archy His party remained in power till 1738, when it was ousted by the Hats. I nder his leader-hip the country prosper d, and the years when he was marshal ame to be spoken of as the time of Arvid Horn.' See Gustav Horn, Arvid Bernhard

Hornbeam, or Carpinus betulus, species of Petulacem, found in N. climates and a

HORNBEAM

native of Britain. It greatly resembles the beech in habit, but its leaves are rough and ein like The timber is extremely rough, but is not very often used. In April it bears male and female catking, and the latter precede a number of one-seeded nuts with a three-lobed wing on one side.

HORNBILL

Hornbill, name given to the many species of cora nform brids belonging to the family Bucerotide. They are of considerable size, and derive their name from their immense dentated downward-curved beak, with the horn-like easque at the base. The species range from Africa, India, to the Malavan region, and are remark the for their slow and heavy flight, which, however, is counter-balanced by the pneumatic nature of their bones. The members of Bucarus are omnivorous and feed chiefly on the ground, their food consisting of roots, insects tortoises, etc. During breeding the female is imprisoned by the male in the hollow of a tree which he plasters up, leaving only a small shit for the admission of food B. abysanics is the best known species, other genera being Rhinoplax, Aceros, Lophoverus, and Anorhinus

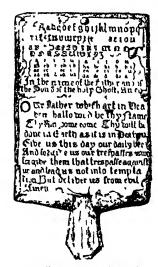

Hornblende, commonest member of the

Hornblende, commonest member of the amphibole group of rock-forming minerals. It is of all colours, but the name is generally restricted to the black or very dark green vareties. It is similar to augite, from which it can only be distinguished by its cleavage angle (q.z.). The monoclinic crystals are prismatic in habit with a six-sided (ross-section; the augle between the prism faces, parallel to which there are perfect cleavates, is 55° 49′ In metamorphic rocks it generally forms irregular messes without definite crystalline form. The dichrolem is always marked. H. occurs as an essential constitution of many kinds of igneous rocks, and many crystalline schists are almost entirely formed of it.

Horablende Schles, mineral commonly, associated with gneiss and, has frequently, with mice schizt. It follows the contortions of gneiss and is traversed like it by granitic veius.

Horabook, primer, formerly used by children in England to learn the elements of reading, prior to the days of printing. It consisted of a piece of paper or parchment on a tablet of wood, with a slice of transparent born in front, hence the mamo. It contained the alphabet, large and small, the Lord's Prayer, and the Rom numerals, and was prefaced with figures of the Cross. There was a handle attached to it By means of a hole bored for a string, the book could be fastiened to the scholar's girdle. At one time H, were quite common but they have now become very scarce.

Hombostel, Erich von (1877-1935), Austrian musicologist, h at Vienna Studied physics and philosophy at Vienna and Heidelberg, and in 1906 became head of the gramophone archives in Vienna for the recording of the music of primitive peoples, on which he wrote sev learned work. In 1923 he went to Berlin in 1933 to New York and the following year to London and Cambridge.

Hornung, Ernest William (1866-1921)

Hornung, Ernest William (1866-1921)

Eng novelst, b. at Middlesbrough: youngest son of John Peter H. Married a youngest son of John Peter H. Married a stater of Conan Loyle. Educated: Uppingham. In Australia, 1881-86 his early work deals chiefly, with that country. Wrote on many themes, but he owed his popularity to The Amaleur Grackman (viz. the elderly-genticumn-cricketer-burglar, Itaffies, 1899), with its sequels; and Stingares (name of a monocled Dundreary-whiskered bushranger, 1905). Though he dealt in 'sensation,' H.'s strie was refined. H.'s style was refined.

Horology, science which deals with the construction of contrivances for telling the It is well to point out in the first time. place that exact measurement of either space or time is impossible, as no distance can be shown as a multiple or sub-multiple of any particular unit, nor can any period of time be said to contain another period or definite number of times. The problem of measuring time, therefore, resolves itself into an attempt to attain a near approximation to the definition of a unit and the nearest possible measure of a given period in terms of that unit. The parti-cular phenomena which have been recog-nived as dividing time into regular periods are those associated with the revolution of are those associated with the revolution of the earth about the sun, and its rotation about its own axis. The recurrence of seasons due to the earth's revolution has given us the conception of the year, and the problem of calendar-making has involved the measurement of the year in terms of the period of the diurnal rotation of the earth. Machines for telling the time are, however, concerned only with latter unit. The rotation of the earth about its avis is uniform, and occupies the same period every day. The period of rotation is measured by observing the successive returns of a 'faxed' star to the meridian. Such a period constitutes the meridian. Such a period constitutes one sudcreal day, and is used only by astronomers. The sidereal day is divided by universal consent into twenty-four hrs., and the day is said to begin at noon For most practical purposes, however, the time between two successive passages of the sun over the meridian is taken as the unit, and the day is divided into twentyfour hrs., commencing at midnight. The solar day 19 not a uniform quantity, owing to variations in the velocity of the sun, and to the inclination of the equator to the plane of the ecliptic. It is, therefore, necessary to imagine the sun moving at an necessary to imagine the sun moving at an average rate every day, thus giving us the measure of a 'mean' solar day. It is possible, therefore, to assign three different times to any given instant: sidereal time, mean solar time, and true, or apparent, solar time. The sidereal day is shorter than the mean solar day by about four min on the average, or, to be more exact, twenty-four hrs. of mean solar time — 24 hrs. 3 min. 50-5554 sec. of sidereal time. The div. of the day into twenty-four hrs. is a roll of the sexagosimal systems. four hrs. is a relic of the sexagosimal system of notation, as also are the div. of the hour into sixty min. and that of the minute into sixty sec.

Early methods of time measurement.—
The div. of the day into recognised periods

is a natural consequence of any attempt at the proper conduct of affairs. The Egyptians used a horoscopus consisting of a tapering paim-branch with a sightslit in the broader end, and provided with a handle from which hung a plummet. With this apparatus the transit of a star over the meridian could be observed, and the hour fixed. Later on, we find the use of the clepsydra (q.c.), or water clock, and the sand clock fairly universal in Greece and Rome and Hellenised and Romanised countries. The waterclock consisted of a

Sun-dials.—The most exact instrument Sun-diam.—I no most exact materials.

Known to the ancts, was the sun-dial.

Mention is made of a sun-dial in Isalah

xxxviii. 8, which would refer to about

700 B.C. The hemisphere of the Chal
dæan Berosus (c. 300 B.C.) was half a

hollow sphere with its rim horizontal, and

a small sphere fixed at the centre. The shadow cast by this object on the inner surface of the hemisphere, traced out a circular arc during the time the sun was above the horizon. The like, adopted the above the horizon. use of the sun-dial from the Babylonians, and mention is made of one placed in Rome in 290 B.c. The science pertaining to the construction was called anomunica the Arabians were chiefly responsible for its development. The essential parts of its development. The escential parts of a sun-dial are the dial itself and the style, a piece of rigid met.! which casts its shadow on the dial. In a dial may be fixed horizontally, vertically, or inclined to the horizon. In the horizontal dual, which is the commonest type, the plane of the style must lie along the meridian which may be found by observing the successive shadows east by a vertical red and cessive shadows of equal length. This gives the direction of the shortest shadow, and consequently indicates twelve o'clock noon on the dial. The other ire, are ob-tained by calculating the angles on either side of the twelve o'clock shadow. It is obvious that sun-dials only tell the time during the day, and then only when the sun casts a distinct shadow. The time. noreover, is true solar time, which has to be corrected by the equation of time to give mean solar time. Portable dials were made and were commonly set in the meridian by the aid of a compass. Ornamental dials formed a feature of many country houses, but the growing perfection of clocks and watches rendered their employment unnecessary after the seventeenth century.

Clocks.—A clock is said to have been constructed by Pope Sylvester VII. in A.D. 996, with weights as motive power. Many of the early church clocks were simply striking instruments, with no dial to show the time. In 1288 a clock supplied with bells was put up 'n Westminster Abbey. bells was put up 'n Westminster Abbey, and many cathedrals posvesed clocks as early as the fourteenth century. The famous clock at Strasburg Cathedral was constructed in its original form between 1352 and 1370. The regulating mechanism of these clocks consisted of a verge escapement with a balance. The pendulum was adapted to clock mechanism in the seventeenth century, and corrections for temp. were introduced by John Har-

vessel of known capacity, whose base was perforated in such a way that the water leaked away slowly, and at a fairly uniform rate. Some instruments were provided with floats pointing to the hrs. inscribed on a vertical scale. The water clock and the sand clock (which was constructed on the same principle) were used to assign a limit to the duration of speeches in courts of justice, a use which has persisted in the form of the hour-glass estab. In certain clurches to this day.

Sun-dials.—The most exact instrument

| Control of the latter also invented the lituminated dial plate. Many modifications of the general structure of clocks have been introduced from time to time. Clocks which do not strike the hrs. are usually differentiated as timepieces; many play chimes or tunes in addition to striking the historian previously adjusting the Time on a separate hour indicator.

| Control of the latter also invented the lituminated dial plate. Many modifications of the general structure of clocks have been introduced from time to time. Clocks which do not strike the hrs. are usually differentiated as timepieces; many play chimes or tunes in addition to striking the historian previously adjusting the control of the general structure of clocks.—All

General construction of clocks.—All clocks made on the usual principles contain their own motive power, which may be a coiled steel spring or a weight suspended by a chain or wire; a train of wheels, by which the motion is communicated to the hands on the dla! a pendulum or other device for regulating the motion of the wheels; an escapement by which the motion of the pendulum is applied to the wheels; there is often a striking mechan-ism. In the case of a clock actuated by a suspended weight, the motion is first of all communicated to a barrel around which the cord holding the weight is coiled. The axis of the barrel and the arbors of the other wheels are socketed in two parallel plates kept at a constant distance by rigid pillars. Having the same axis as the barrel is the great wheel of the clock, which drives the centre pinion on the arbor of the centre wheel. The arbor of the centre wheel is produced through the front plate to the dial and to it is attached the min. hand. The centre wheel engages with the pinion of the second wheel, and the econd wheel with the pinon of the exapement wheel. The pallets of the exapement oscillate on an arbor which loins a lever or crutch at right angles, having at its other end a fork by which the motion of the pendulum is communicated to the economent. In front of the front-plate of the clock the prolonged arbor of the centre wheel is socketed into a spring pressing against a wheel communicating with the min. hand. The contact is sufficient to ensure the proper motion of the mm hand, but is not strong enough to prevent the adjustment of the hands from the front. Engaged with this wheel is another wheel with the same number of teeth, but bearing on its arbor a pinion which engages with the bour-hand wheel, which has twelve times the number of teeth of the pinion, and is concentric with the minute-hand wheel, though it is surmounted on a hollow tube surrounding the arbor of the minute-band wheel.

Pendulum.-The biggest advance in H. is that due to the introduction of the pendulum. The mechanics of a sus-neuded body had been investigated to come extent by Galilieo, but there is some doubt as to the horologist responsible for its adaptation to clock mechanism, though the honour is usually ascribed to the liutch physicist, Christiaan Huygens. In theory, a pendulum consists of a small theory, a pendulum consists of a small heavy mass concentrated at the end of a light string or row which is free to move about a fixed point. When the arc of oscillation is large, the period of the os-cillation depends upon the amplitude of the swing, but this is not so when the arc of escillation is small. The forces acting upon the bob of the pendulum are its weight acting vertically downward, and the tension of the string acting in the direction of the away At a given moment the motion of the bob is along the tangent to the arc, and as this is at right angles to the direction of the string, the tension of the string, the tension of the string cannot be reselved along the

AN FNGLISH CLOCK IN STLVIN CASE C. 1659. BY D. BOUGET

tangent The motions of the bob constitute simple harmonic motion, so that the vibration is isochronous, that is, whatever the amplitude of the vibration the periodic time is the same. This result is of the utmost importance in considering the pendulum as a time regulator. It means that whatever the power of the driving mechanism, whether the pendulum is moving strongly or feebly as long as the same, in clocks, the pendulum is a bob fixed to the er d of a rigid bar; the bar itself has weight, so that the centre of oscillation is somewhat above the centre of ogravity of the host. The great desideration is that the length of the pendulum from point of suspension to centre of oscillation should remain constant.

Compensation.—As metals expand on timeprisation.—As metals expand on increase of temp., the length of a pendulum tends to increase in hot weather, with the result that the period of oscillation is increased and the clock loses. It is, therefore, necessary to make some contrivance so that the centre of gravity and the whole pendulum shall be moved uparalt at the some extent as the expression. wards to the same extent as the expansion due to heat moves it downwards One of the earliest devises for this purpose is demonstrated in Graham a mercarial pendulum. The bob consists of two glass eviliders containing mercury by adjusting the quantity of mercury in the glass voscels, the moving apwards of the centre of gravity of the mercury can be made to compensate for the lowering of the centre of gravity due to the increased length of the rod. Another compensation device is that invented by John Harrison. in 1726, and commonly known as the gridiron pendulum. It consists of a frame-work of metal rods of two different metals, iron and brass being generally used. The tody are so are inged that the steel bars lengthen downwards in expanding, while the brass rods are fixed at the bottom and lengthen upwards By adjusting the lengths of the respective metals in the in-verse ratio of their co efficients of expansion, the expansion upwards can be made to counteract cractly the cypansion downwards An improvement in these methods of compensation has now been affected by the use of 'invar,' an alloy of makel and steel

Escapements -The function of an escapement is to apply an impulse to the pendulum to cause it to vibrate and to lock the escapement wheel until the pendock the escapement wheel until the pendulum to the pendu dulun has completed a vibration In this way the clock mechanism proceeds in 1 rks, one tooth of the eyespement wheel being advanced for each simile wibration of the pendulum. Soon after the introduction of the pendulum, the anchor es-capement was invented by R Hooke It consists of two claw shaped convex pallets mounted on two limbs oscillating about an axis at the junction of the limbs Each pallet is driven in turn into a notch be-tween two teeth and as it is being withdrawn, it receives an impulse from the turning wheel which serves to keep the pendulum oscillating. The pendulum is, therefore, never free, and a recoil is occa-sioned at the end of the vibration. This disadvantage is obviated in the deadheat escapement, in which the serrations of the where point in the opposite direction. advantage of this escapement is that there is no recoil so that it is well adapted for clocks in which great accuracy is required. Mant cacapements are constructed on the remontoire ' system, in which the escapement has a driving power of its own, esp-plied other by separate winding by the clock train, or by allowing the pallets to drop on to the pendulum by the action of gravity.

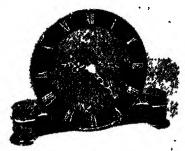

The wheels of a clock are usually made of hard brass and are cut by a whoel-custing machine adapted to the sitch of the wheel. By pitch is meant the number of teeth to each inch of circumference joircomferential pitch) or to each inch of diameter (diametral pitch). Pinions are sometimes made in lautern form, and with specially—haped com give satisfactory re-sults. It is necessary to have come ar rangement in a clock by which the motion of the clock train is not interfered with by or the circum of minings. This is effected by such a contrivance as Harrison's going ratchet. The great wheel has on its face a ratchet wheel with a click set in the clock frame. Upon this ratchet wheel is set another with its teeth pointing in the set another with its teeth pointing it the opposite direction, and its click set upon the larger ratchet wheel. The winding of the clock, therefore, does not cause the revolution of the larger ratchet, as that is prevented by the click set in the clock frame. Striking is effected by a some what complicated mechanism at the front of the clock The essential part is a small wound round the hour wheel. The snall bas a step for each hour, so that a lifting piece is allowed to fall into a position along a rack from which the number of notcheto the end determine the hour to be struck A pin on the min wheel sets the striking mechanism in readiness for going a few min, before the hour. Other additional mechanisms are 'alarm' arrangements tell-tale 'contrivances, etc. The alarm is set by turning an in a stor upon a small dial: the indicator is attached to a wheel set upon the hour-hand wheel by means of a friction spring. A form of watchman's clock is that in which a set of spikes project round the dial in such a way that when a handle is pulled, the spike which happens to be opposite is pulled in. In the morning the spikes pushed in indicate at what hrs. the watchman operated the clock.

The perfecting of the electric clock, first invented by Alexander Bain in 1848, is a recent development. In one type electricity is used to wind the clock by means of a simple direct current motor, operated from a hattery. In others the clock is a simple synchronous motor running in step with the alternators of the power station which supplies the electricity. The frequency of the current generated is constant, being 50 cycles per sec. and (in United Kingdom) is constant for all electricity stations. Clocks are manufactured on a large scale in the United States, particularly in Connecticut and New York. In England the chief centres of the industry are Lendon and Handsworth near Birmingham and there is a recently establicity of the content of the findustry in S. Wales. Many cheap but excellent clocks are made in the Plack Forest region in Germany while the didnatry also flourishes in Switzerland, France

und Iraly.

Until very recently the oscillating quartz crystal was the most accurate stendard of time measurement. If a constant temp, is maintained, the oscillations in a piece of quartz at its natural resonance frequency can be held to a constant of one part in a hundred million. The frequency of the oscillations is reduced until they are capable of driving an electric motor. Atomic physics has now provided a further refinement of accuracy; the new primary standard of time and

frequency is the constant natural frequency of the vibrations of the atoms in the annuonia molecule. The oscillations of the quartz crystal are compared with the amnuonia absorption line, and corrected when necessary, achieving stability against drift. An immediate benefit may result in radio communication, by obtaining the necessity of wide frequency bands.

Smith's Light (locks, Ltd an electric clock, 1950

in clock is finished in without and gift, or padouk an ibronze. It is also manufactured with an 8 day lever movement

Musical Clocks. — Elaborate musical clocks hist made their appearance in England in the early part of the eighteenth century, the name of Charles Clay, official clock-maker to His Majesty's Board of of Works, being most prominent. In 1716 Clay, a Yorkshireman of the W. Riding, petitioned Parliament for a patent in respect of a repeating and musical watch or clock of his invention. A formidable risal, Daniel Quare, ex-master of the Clockmakers' Company, produced a watch alleged to answer the same end as Clay's; but though the atternety general reported in Clay's favour, the opposition of the Clockmakers' Company finally defeated Clay's petition. This set back however did not deter Clay from coming to London, where he eventually acquired so great a reputation as a craftsuan that he could count on the co-operation of eminent artists and musicians in making his clocks. One clock, which Clay exhibited before the Royal Family in 1736, is described (k. J. Britten, Watch and Clock-makers of the World, 1899) as resembling a large table-clock on a rectangular pedestal, being \$\frac{1}{2}\$ ft. high in the arch above the dial are a subsidiary dial showing the age of the moon and the day of the moon had the names of the musical pieces played by the clock. These are (i.) Arrangelo (mell'i Twelfth Comerto, let Adago, 3nd Alleryn, 3nd Saraband, 4th Jigg, and (if.) the Fague in the for view of Arrange, i.e. the second movement of the overture in Handel's opera (inst pub. in 1734). The musical machine consists of a barrel 12 in.

in diameter working on a chime of twentyone belis, and is contained in the pedestal Corelli's concerto is in F major, and Handel's overture in the relative D minor, Handel's overture in the relative D minor, which suggests that the chime was based on an F major scale. Clay's choice of music was of a higher quality and far more elaborate than that supplied by most eighteenth-contury makers, whose repertory is usually confined to the fushionable dances, marches and hymn-tunes of the day. There is a direct relationship between Clay and Handel in this connection for in the index to a vol. of his 'ploces' for a musical clock 'one set is named by Handel Ten Tunes for Clay's musical clock, six being original compositions, and five being arias from Haudel's own operas — For the arias from Haudel's own operas. For the making of his musical clock called The Temple of the Four Grand Monarchies of the World, Clay had the co-operation of Jacopo Aniconi (or Amigoni), the painter, Louis François Roublike, baroque sculptor, John Michael Rysbrack, silver work, Handel, and Geminani, the violin virtuoso. This remarkable clock, which was not completed in C.'s lifetime, subsequently passed into the recoverying of the was not completed in C.'s ineture, subsequently passed into the possession of the Princess Augusta, wife of Frederick, Prince of Wales, and mother of George III. Another typical inusical clock of Clay's is that in the Royal Palace at Naples. The world with the little and the research of the little way. music of this clock was provided by a little pipe-organ, worked by a barrel, but there was no list of tunes. Tradition has it that was no list of times. Tradition has it that this clock was given to Maria Carolina, Nelson's Queen of Naples, by Sir John Aoton, Eng. born Prime Minister of Naples. (See E. Croft Murray, 'The Ingenious Mr. Clay,' Country Life, Dec. 31, 1948.)

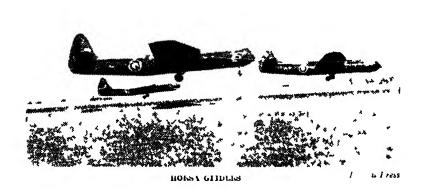

Watches.—Early watches were really ortable clocks. They were driven by a portable clocks. They were driven by a mainspring, and the motion was regulated by a small balance escapement as in the clocks of the same period. Such instru-ments were often too large to be carried in the pocket, and were suspended from the girdle by a chain or cord. Frequently they were globular in form, and gained the name of 'Nireunberg eggs' on that ac-count. Early in the sixteenth century an arrangement called the fusee was adopted. This consists of a mainspring enclosed in a barrel on which is wound a piece of catcut or a chain which is also wound upon a spiral drum in such a manner that when the mainsprings weakens as it relayes, the leverage on the spiral increases, so that the force remains fairly uniform. The the force remains fairly uniform. The form of the watch lent itself to a high degree of ornamentation, and the watches Tudor times are remarkable for the delicacy of the engraving on their cases. Many of them contained a striking mechanism, and when this was dispensed with a decrease in size and weight became possible. Thomas 'Fompion (1639–1713) invented a dead-beat escapement for watches, which was afterwards improved upon by George Graham (1673-1751). The

offered rewards of £10,000, £15,000, and £20,000 for chronometers which would determine long within an error of £0, £0, and 30 geographical m. respectively. In 1761 John Harrison sent his son on a voyage to Jamaica with a watch of his own construction. It lost one min. fifty-four and a half sec. on the double Journey, which was equivalent to a determination of long, within an error of 18 m., according to the terms of the Gov.'s offer. On a subsequent voyage of four months duration to Barbados, one of Harrison's chrono-meters showed an error equivalent to only ten geographical miles. The reward offered was tardily paid by the Gov. who did not sympathise with the principles upon which Harrison constructed his watches. A modern watch possesses a case for containing the mechanism, a mainspring and winding-up mechanism, a balance wheel and hair spring, and an escapement. The mainspring is a thin strip of tempered steel, and in most modern watches tapers very gradually from one end to the other. The fusee is now little end to the other. The fusee is now little used, and inequality in the driving force is compensated for in other ways. The mainspring was formerly wound up by a separate ker, but this is now avoided by connecting the mainspring barrel with the pendant. 1 push button is also provided by which the wheels connected with the pondant can be thrown out of gear with the barrel wheel and connected up with the hand wheels to set the hands when required. The driving power of the main-spring is communicated to the train of wheels as in ordinary clock mechanism. The function of the pendulum in regulat-ing the speed of the train of wheels is taken up by the balance wheel. This consists of a small brass wheel to which is attached the balrapring, a fine appral spring with centro of gravity on the axis of the balance wheel. The elasticity of the spring cames the wheel, when impelled from its normal position in either direction, to return bevond its normal position, and the time of oscillation is the same for different impulses within certain limits The impulse is supplied to the balance wheel by the escapement, which also communicates the rate of oscillation to the train of wheels. The commonest oscapement in Eng. made watches is the lever escapement. This device, invented by Thomas Mudge in the latter part of the eighteenth century, is an adaptation of the dead-best escapement The pallets are fixed applied to clocks. to a lever pivoted at a point midway be-tween the pallets, and furnished with a notch which engages with a small pin on the balance wheel near its axis. The motion is so adjusted that when a tooth of the escape wheel escapes from one of the pallets the pin slips out of the notch and enters it again on the return of the balance wheel, moving the lever sufficiently for the next tooth to escape. The pallets of the lever and the pivots of lever and escape ext great development was the invention wheel are usually lewelled, and undue of the curb-compensation for the hair-spring by John Harrison (1693-1776), who himself constructed chronometers of marvellous efficiency. In 1713 the Brit. Gov. called the 'detached' escapement) provides for one impulse only in a double velocity of light See T. Reld, Treatise on oscillation and the unlocking occurs every Clock and Watch Making, 1849, E. J. other vibration It is too delicate for Wood, Curiosities of Clocks and Watches, use in ordinary portable watches, and is specially adapted for chronometers which are maintained in a horizontal position by gimbals Compensation for changes due to difference of temp is necessary for two reasons. The expansion of the balance wheel increases the moment of inertia of the wheel so that it requires a greater force to turn it in a given direction. The ordinary compensated balance wheel has a circumference consisting of two or more sections cach of which is composed of an inner har of steel melted upon an outer bur of brass, this compound bar carrying a

small weight The inequality of the expansion of the two metals results in a bending of the bar inwards thus carrying the weight towards the centre of the wheel Such a contrivance requires care ful adjustment Secondary compensa tion is necessary on account of the weaken ing of the elasticity of the hairspring through rise of tup. Apparatus designed to record very small diva of time with great accuracy are called chronoscopes with grain acting and cancer carriaged so as to proserve a more of less permanent record, they are called chronographs $(q \cdot)$ Such mochanisms are often dependent upon the breaking and establishing of electrical contacts and are brought to a block with a furfaction classes. high pitch of perfection Greater and greater degrees of accuracy are constantly being achieved, but it must be remembered that absolute accuracy is not only impossible by the nature of time, but also through the fact that no physical process can be said to be ultimately instantan

After studying at Cambridge he returned to his native place and there began his astronomical observations. In 1639 how ever he was ordained curate at Hook in I ancashire and there made his observation of the transit of Venus Among his writ of the transit of Venus Among his with max are benus in 8 to 1200, printed by Hevelius in 1662 and portions of his writings pub by the Royal Society under the title berema Horractopera Postuma Sec 1 E Balley, Pilatine Volebook, 1882 Horsa, sec Herouse Ard Horsa, Brit troop carrying glider, with a wing span of 85 it and carrying capacity of these tons of fright or fiftigen men

it of three tone of freight or fifteen men with arms and equi ment. The fuselage are of box shape, and a wooden frame nork ensured cast production Large numbers were used in the Normandy invasion, at Arnhem and at the crossing of the Rhine

Horse: History — There is abundant evidence of the exitunce in Cresar's time can be said to be ultimately instantan of Brit or Celtic I miss throughout the eous. For instance, if two clocks are supposed to be exactly synchronous, they are not so when viewed from each other their difference being a function of the difference being a func of Arabian or thoroughbred blood, show no tendency te increase their size. The large H. was probably unknown until the Norman invasion. Then animals of the Andalusian or Chestnut type were introduced, and from these and the large Bel-gian or Flemish H., the war H. ridden by knights in armour and later the modern heavy cart H., were evolved. Although the evidence of the oldest writings, sculptures, and frescues goes to show that Hs. were driven long before they were ridden. the H. was probably employed and bred almost solely for war purposes for a long period. As far back however, as the time of Henry II., the tournament was intro-duced and H. racing first captivated the Eng. people. But wars, of vil and foreign, seriously depleted the H. supply, and in 1495 Henry VII. forbade the export of any H. without royal permission, and of any mare whose value exceeded the 8d. It was Henry VIII. who made H. stealing a During his reign, the weight cap, offence of armour reached its maximum, and in consequence, large and strong Hs. were in beary demand. By this time the value of the H. in agriculture had been realised, and the pack H. was in extensive use for transporting goods. The use of state chariots by noblemen virtually originated the present road system and modern methods of travel. Coaches were introduced in the reign of Queen Elizabeth, and the importation of Arabs and other foreign stock laid the foundations of the modern race H. or Eng. thoroughbred. With the improvement of the roads, and the use of coaches, carriages, and lighter vehicles, great attention was paid to the development of the barness H., and the Hackney or Norfolk Trotter was evolved from a foundation stock of Scandinavian Hs., and the Cleveland Bay and the Yorkshire coach H. were developed.

Brkeps.—The majority of Hs. in use in

Breens.—The majority of the Creat Britain belong to no distinct breed, being of a general utility character, such being of a general utility character, with the development of motor traction, however, the number of such Ha., formerly much used for omnibuses and cabs, has declined rapidly, and the porrentage of pure bred animals has increased. The following are the distinct breefs: the Racehorse, or Thoroughbred, and the Hunter, the Hackney, the Yorkshire Coach H. and Cleveland Bay, the Shire H., the Clydesdale, and the Suffolk Punch; while aroung popies are the Pole pony, the while among points are the Polo pony, the Hackney pony, the Welsh, the New Forest, the Highland, the Shetland, the Dartmoor,

the Exmour, the Fell, and Connemara.
The Thoroughbred is said to have developed an inch in height in every twen y-five years since 1700, and for considerably more than a hundred years has been kept absolutely pure. While it owes much to the Arab all authorities agree that it would not benealt by further intro-duction of Arab blood. The majority of thoroughbreds are bay in colour, and their number appears on the increase. Chest-trut is a fairly frequent colour, blacks and browns are rare, and grey thoroughbreds are practically extinct.

Hunters are bred from at least one thoroughired parent, excellent animals for the purpose being produced by crosses with small Clydeadale or Sunok mares. Irish hunters have long been considered the heat here. A mahoguny-brown colour is preferred, black, bay, or dark chestant coming next in favour. Greys, rosas, and light chestants are not fashionable. A hunter should be thick and strong on the back and loin, with long powerful quarters and numerilar thighs and neatly-shaped and clean books. Size, stamma, action, and reliability at fences are essentials in a good hunter.
The Hockney H. is the beautiful harness

H. of high action, arched neck and fast pace. A Hackney must be over 14 hands high, i.e. exceeding 56 in., but the average high is about 15-3 hands. Hackney-bred carriage Hs. of 17 hands can be obtained. The distinguishing feature of the tained. The distinguishing feature of the breed is its very high and free action. It is a powerfully built, short-legged, big, broad H., with an intelligent head, neat neck, strong level back, powerful loins, tlat-boned legs and good fort.

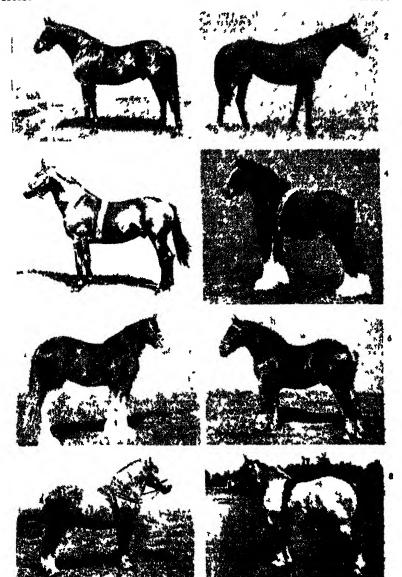

The Cleveland Bay with its offshoot, the Yorkshire Coach H., which tends again to Yorkshire Coach II., which tends again to amalgamate with the parent stock, is the general utility II. There is no better base or foundation for crossing to obtain hunters, cavalry IIs., and harness IIs. The Cleveland Bay is about 16 hands 2 in. in height, bas a short back, powerful toins, and long quarters. Black zebralike stripes above the hock, which occursionally occurs are supposed to denote signally occurs are supposed to denote sionally occur, are supposed to denote special purity of breeding. The colour of the Yorkshire Coach H. is usually dark bay or brown. The mane and tail are black and thick. A fine head, sloping shoulders, strong loins, lengthy quarters, high stepping action, and abundance of bone and muscle characterise the breed which undoubtedly owes something to the Thoroughbred.

The Shire is the largest draught H. in the world, commonly attaining a height of 17 hands, weighing as much as 2000 lb. Though immensely strong, it is very docile and intelligent, and has a good free action. The prevailing colours are black, bay, and The prevailing colours are black, bay, and brown. The short stout legs have a plentiful covering of long hair known as 'feathering,' from the back of the knees and bocks to the parterns. The neck is well arched, chest wide and full, back short and straight, ribs round and deep, and the quarters long, lovel, and well down to muscular thighs. The breed is directly descended from the great way. If directly descended from the great war H.

of medieval times.

The Clydestate is the agric. II. of Scot-nd. It is somewhat smaller than the Shire, but is claimed to be of finer tinish. Bay and brown are the commonest colours. play and frown are the commonest convirs, black and grey coming next, and, more rarely, chestuut and roan. The shoulder is more oblique than in the Shire, but the 'feathering' on the backs of the legs approaches the style of the latter. The broad is remarkably active in work, and is possessed of great strength and enduraure.

The Suffolk Punch is quite distinct from

80ME BRITESH AND FORRIGH BIGHELS

1, Thoroughbred

2, Irish Hunter (Farmer and No. & breeden), 3, Cleveland Bay (Yorkshee Post), 4, Shire, 5, Clydesdale 6, Suffolk Punk i Farmer and Stock-breeden), 7, Pertheson (Sport and General), 8, Brabaucon (Ten Hagen)

the other native draught Hs., and its hind-quarters. It has to carry at top-clean legs, or freedom from 'feathering.' speed weights considered ample for hunt-make it specially well adapted for working ers of 15 hands and upwards. All des-on the land. The Suffolk is always a criptions of native breeds have been drawn on the land. The Suffolk is always a chestnut, varying from light sorrel to dark mahogany. It has long been kept pure, and always breeds true to colour. It averages 16 hands, and sometimes weight as much as 2000 lb. The Suffolk is fumous for its willingness to pull at a dead weight and is an averagingtive. is famous for its willingness to pull at a dead weight, and is an exceedingly active animal. It has a very finely arched neck, low shoulders, thick withers, and a deep round barrel-like build.

Foreign Horses.—The Arab is the most distinguished non-Brit. H. The earliest traces of it go back to the sixth century an and since then the bread has been

A.D., and since then the breed has been A.D., and whe then the bred has been constantly improved by rigorous selection. It has great powers of endurance, fine intelligence, and rare courage, as well as perfect shoulder action and a light mouth. It is the ideal cavalry H., and was in request by the Remount Dept. of every war office in the world until the develop-ment of mechanised warfare. There are ment of mernanised warrare. There are sev. Arab stude in Great Britain. Amongst other foreign breeds are the Percheron, the famous cart-horse breed of France (also bred in England), the Brabancon of Belgium, the Russian Orloff, the Prussian Trakehner, the Jutland, and the Amer. Trotter.

Proter.

Punies.—With the exception of the Shetland, Brit. ponies owe much to Arabian and Thoroughbred blood. The pony breeder's object is to compress the most valuable qualities into the least compass, the aim being an animal with a most based on the second transfer of the compass, the aim being an animal with a small head, perfect shoulders and true action. Yet a pony must not only be a diminutive H.; It must have true pony character. The various breefs range from 14 hands, or even a little bigher, down to 8 hands. The Shetland has been known sometimes to be no more than 26 in. high. Black, bay, and brown are the favourite colours. The Shetlands sure-footedness, intelligence, and good nature make then ideal companions for children. The Highland pony is the for children. The Highland pony is the largest and strongest of native ponies, and is unequalled for hardiness and staying power. The commonent type is the Carpower. The commonest type is the training of the training a stout H, or back). This breed is said to owe some of its features to the Percheron. Allied are the Barra, the Uist, the Rum, and the Skye ponies. The Welsh pony is somewhat the street of the Birthead pony but Skyc ponies. The Welsh pony is somewhat similar to the Highland pony, but is a faster animal; in colour bays and browns are the usual shades. The New Forest pony is most commonly a fiesblitten grey. Its height ranges from 12 2 to 13.2 hands. The Dartmoor and Exmoor are other parfectly hardy breeds.

or in creating the Polo pony, which should measure from 14 hands to 14 hands 2 in.
DIMEASES. Amaurosis, or Glass Eye, is a derangement of the optic nerve. The II. carries its head well up, and steps very high. It is incurable, and its detection is high. It is incurable, and its detection is very important in buying Hs. Authrax (q.v.) is a very contagious disease, and must be at once reported to the police. Astima, Broken Wind, or Heaves, is sometimes due to influenza, bronchitis, or pneumonia, but more frequently to bad food, such as musty hav or corn, or to too much exertion after feeding. Two or three grain doses of arsonic once a day in a mash may give relief. Azoturia occurs when animals are too well fed and have too little overcise. After a little work, the H. sweats profusely and ejects large quantities of blood coloured urine. Bloeding is supposed to give relief. Bog Spavin is a distention of the capsular ligament of the hock joint, and is commonest in cart Hs., especially young Clydosdales. A dressing of green tar and turning out to grass has a good effect. Bone Spavin is a bony enlargement on the lower part of the hock joint brought on by injury or over-exer-tion. Rest, blisters, and firing are recom-mended. Bots are the grube of a gadily. The eggs are laid in summer on the shoulders and forelegs, and are licked off and swallowed. There is no satisfactory remedy, but a H. singeing lamp should be used to destroy the little yellow eggs. Broken Knees are of frequent occurrence. After washing and dressing with antiseptics, cold water bandages are applied. Bronchitis causes great debility. The H. should be placed in a well-ventilated box, the legs bandaged and warm sheets put the legs bandaged and warm sheets put on the body and a pail of cold water con-taining a tablespoon of nitrate of potasi-given it to drink. Calculi are stony accumulations, occurring in the large intestine, and commonest in miliors' Hs. They are often passed naturally, but strong purgatives must be avoided. Canker in the foot is a growth of horn on the sois, produced by injuries or by disty Canker in the foot is a growth of horn on the sole, produced by injuries or by dirty wet litter. The H. must be kept dry and the foot dressed with powdered alum and dried tow. Capped Hock, Knee, or Elbow is a swelling due to a collection of fluid under the skin. Apply hot or cold applications and stimulating lotions. Cataract is a pearly-white appearance of the crystalline lens of the eye, which must be carefully looked for in a possible purthe crystalline lens of the eye, which must be carefully looked for in a possible pur-chase. There is no treatment. Catarrh, or cold in the head, bowels, or bladder is often neglected, but should have prompt attention. Warm clothing, bandaging the legs, a tablespoonful of nitrate of potash, and good varied reeding should restore health. For Collo, or Gripes, two to four ounces of laudanum with two ounces of turnentine in a pint of linseed 13-2 hands. The Darkmoor and Exmoor ponies are other perfectly hardy breeds, of ten neglected, but should have prompt the Fell pony is a native of Cumberland and Westmorland, used by the farmers for all sorts of work. In colour it is usually black, brown, or bay. The Connemars pony, an Irish breed, supposed to be derived from Sp. crosses with native mares, is a big pony, and is much sought after for polo. A pony suitable for polo of Conjunctivitis bathe with tepid water must have powerful riding shoulders, with strength across the loins, and muscular acid lotion. Corns generally occur in the

fore-feet. The shoes should be removed orrespect. The snoes should be removed and a poultice of cold water and bran applied. Crib biting and wind sucking is often a bad habit, though it may be a form of dyspersia. Feeding on the ground, providing a muzzle, or substituting iron for wooden stable fittings may offer to cure. Curb is an epigrament of effect a cure Curb is an enlargement of the back and lower part of the bock joint. the deck and lower part of the local parties. Rest, cold water bandages to reduce the inflammation followed by blistering and firing are beneficial. Diabetes is characterised by the passing of enormous quantities of urine due to bad food and impure water. Rost, good food, dram doses of lodine in a ball, and twenty five drops of hydrochloric acid in the drinking drops or hydrochloric acid in the Grinking water are advisable. In Diarrhora small doses of liuseed oil and laudanum will check an attack. Eczema is very contagious. Triat the affected parts with a disinfectant fluid knteritis, or Inflammation of the Rowels, is a fatal disease, the pain being continuous, and death offer occlusing the oracle was the pain being continuous, and death often occurs in five or six hrs. Hypoder-mic injections of morphia and atropine ane the safest treatment. Farcy and trianders are alled forms of a highly dangerous and contegious disease which is compulsorily notifiable to the police. With chronic glanders, a H. may go on working and feeding for month while a ragged un healthy coat and a leaden hue to the healthy coat and a leaden hue to the membrane of the nostril as the only signs, but such an animal may be a general source of infection. All Hs, and ponies have to be incoulated with mallein before being put down into a coal mine (For fuller details on this, see GLANDERS) Founder, or Laminitia, is an inflammation of the feet. Bleeding often gives relief, as also injection under the skin of a solution of coleration. also injection under the skin of a solution of adreualin. Fractures are of six kinds 1, simple; 2, compound, 3, compound comminuted, 4, compleated; 5, green stick; 6, impacted. In the second and third cases treatment is practically useless, and the H is best destroyed. All the bones of the H is body are subject to fracture. They must be put in position and splints and bandages applied Gastritis or Inflammation of the Stomach, usually proves fatal. Four ourses of usually proves fatal. Four ounces of laudanum in a pint of linseed oil will relieve the pain. Injections of sixty to eighty drop does of morphia and atropine are beneficial. Grease is an inflammation of the skin, the hind legs of cart Hs being most subject. Wash with disinfertants, and dust with boracic acid, lodoform, and charcoal. Hernia is a dis placement of the bowel. A bandage should be sewn tightly round the body until the rupture is reduced. Larvngitis needs careful attention, as if acute the H may become a roarer. Mustard mixed with cold water rubbed on the throat generally effects a cure. Steaming the nestrils with eucalyptus oil time or four nostris with enchypter on inite or four times ado has a southing effect. Locking, or Tetanus, is frequently a fatal disease communicable to man. Antistetanus serum injected at the lower portion of the neck has been successful in some cases. Mange is a parasitic disease, the protuberance in the control of the Any parasiticide except those containing

arsenic can be applied, but as the disease may be deep-sected or superficial, treat-usent varies greatly in effectiveness. The distance has been compulsorily notifiable. Nephritis, or inflammation of the kidneys, requires perfect rest, hot clothes, and small doses of linseed oil and laudanum. Pheumonia is much relieved by bleeding, accompanied by a dose of from ten to twenty oz. of lin-eed oil mixed with one or two oz. of spirits of nitre, and ten to ffteen drops of a onite tincture. Roaring a peculiar noise made in the act of inspiration, and is a characteristic of unsoundness. Operations cometimes effect a cure Saddle galls are the result of badls-ntring harnes. They should be washed with antiseptics and dressed with zinc and lead lotion Sidebone, the ossi-fication of one or both of the lateral cartilages at the sides and top of the hoof, is commonest in cart Hs., and is often caused by high-heeled shoes. Hs. with suctione are unsound. An operation, the use of the bar shoe, and blistering may rectore soundness. Strangles is an infor tions disease commonest in youngs and most seen during the spring months.

Abscess a are formed under the law, round harmath the ears. With the throat, and beneath the ears. With good nursing it often passes off mildly. A preventive serum is recommended. Strangles frequently terminates in roaring.

I large vocabulary has attached itself to the breeding and management of Hs. The following is a glossary of terms in more general use: arm, or shoulder, the upper part of a fore-leg from just below the withers, to just above the elbow; bars of the mouth, the spaces between the canne teeth and the grinders; they occur at the angle of the lips and in them the bit is placed; bay, a reddish nut-brown colour with black points; blaze, a stripe of white down a horse's face, calf knee, a knee that bends sideways towards its fellow, kneck-kneed; castors, chestnuts, or creats, horny excrescences on the inside of each leg above the knees and below the of each leg above the knees and below the hocks. Chestnut. reddish-brown lighter than bay, but without black points, and frequently with one or more white stock-ings clicking, or forging, a defect in a H.'s paces when it knocks the feet against one another; cob, a compact short legged ii.; coffin bone, the bone in the centre of the hoof; cotonet, the bony fringe round the top of the hoof; dappled, coat sprinkled with rings or spots of a darker colour; docking, shortening the tall dun, a dull dark brown generally with black extremities and a black line down the back; elbow, the bony projection just below the junction of a H.'s for leg and body 'fetleck, a lock of short half hanging from the back of the fetlock joint--the junction of the pastern and the shink or cannon home, flank, the part of the H.'s side between the ribs and the hip; the first sind of the control of the sind of the ditter, small red or dark spots on a white or grey coat, also used of a H. with spots on a dark ground; forearm, the part of the foredeg between the knee and the junction of the leg with the body, frog, the protuberance in the centre of the

of a hind-leg between the book and the junction of the leg with the body, grey, the colour composed by a mixture of black and white bairs, hand, a measurement of height of four in, hannehes, the fieshy part at the junction of body and hips hock, the backward bending joint on the bind leg, knee, the forward bunding joint of the foreleg mark (infundibulum), the hollow upon the top of a young H s teeth which by gradually wearing down serves which by gradually wearing down screes as an indication of ago, pastrn, the hone joining hoof and fetlock joint plebald the colour which consists of patches of white and black, points, the extremities of the limbs, roan, a red or blue coat closely decked with grey hairs shoulder the upper part of the foreign from its junction with the body to the shoulder joint alewbald, the colour consisting of patches of any two colours except white and black, snip, a small patch of white upon the nose sorrel the colour formed by vellowish or reddish brown bairs—splint bonce small bones running from hock or knee to fet lock star a square white patch upon the forehead stiffs the joint at the junction of the hind leg with the body thigh the upper part of the hind leg white stocking, the white colouring of one or more legs of a dark or brightly (cloured H) withers the highest point of the back just behind the neck See also Arab Barb Farrifra and Hors Racing See Sir W H Flower, The Horse 1891 W H Wanklyn. Horse-chestaut, or I scalus Hippo custums, well known species of Hippo

Horse-chestnut, or I scalus Hippo castunum, well known species of Hippo castanacee, commonly grown in Bistain as an ornamental tree It was introduced to England early in the seventeenth century from N Greece and Albania It has large leaves divided into five or seven long distinct leaflets and the white Bowers timed with yellow or pink, are arranged in tall showy spikes the fruit arranged in tail showy spiked the fruit is a prukly capsule It is not related to the sweet or sp chestnut see (1FG

the sweet or sp chestnut see (1921). Horse Guards, name of a building in Whitehold London, where the offices of the depts under the command r-in-chief of the army (a rank aboushed in 1904) were situated. Also the name of a cavakry regiment (see next article). The Whitehall building was built in the eighteenth century, and though no longer the headquarters of the army it is still used for military purposes. At the rear, through an archway, is the Horseguards Parade, where the Trooping of the Colour takes place on the King's birthday.

Horse Guards, Royal. Raised in 1661 by the earl of Oxford It wore blue clothing, hence its secondary title 'The Blues' It fought at Sedgemoor, the Boyne and Dettingen In 1812 two Boyne and Dettingen in 1812 two squadrons went to the Peninsula, and were present at Vittoria and the subsequent battle. At Waterloo two squadrons formed part of the famous Household Brigade It served again in the 1822 treatment of the sample in the 1822 treatment of the served again. brigade in server again in the Nile campling was employed as Lainchy. During the S African war (1513-1992) it was at the Relicf of Kimbelley and at Paardeberg During the Liest World War it served in Liance and Llinders from Mons to the Sambre (1913) In the Second World War as part of the House hold Cavalry, it served in Syria is an armoure I car unit in N Africa and Italy and in burope is a reconnuissance unit of the Guards arm mired div

Horse-power, unit used to denote the power of steem and other engines. James Watt was the man who worked out the value of 1 H.P. after experiments with value of 1 H.P. after experiments with strong dray horses. In consequence of the exceptional power of the animals em-ployed, Watt's result is in excess of the amount of work an average horse can compass. It represents the amount of work done, or energy expanded, when 33,000 lb. is raised 1 ft. in 1 min., and equals 146 wates. The Fr. chevel-vapeur is equal to 4500 kilogrammetres a min (32,549 ft.-lbs.), or 736 watt, slightly less than the Eng. II.P. The nominal H.P. of an engine is a term which is quite arbitrary, and is rapidly falling into disuse. The formula for obtaining it is D⊿∜S for high-pressure, and

15.6 47 for condensing engines, where D= the diameter of the piston in in., S= the length of the stroke in ft.

The indicated H.P. (I.H.P.) of a re ciprocating engine is given by the formula 2 A P R S

, where A = the area of the 33.000 piston in sq. in., 5 - the 'en,th of the stroke in ft., P = the mean pressure on the piston in lb. per sq. in. (ascertained from the indicator), and R = the number of effective strokes per min., one for each revolution of the crank-shaft if the engine is single-acting, or two if double-acting.
This formula will not apply in the case of steam turbines, as a statement of the I.H.P. supplies the measure of force acting on the cylinder of an engine, but before the power available for doing external work off the crankshaft can be obtained, that required for driving the engine itself, must be subtracted. The result, when this has been done, is known as the actual, effective, or brake H.P. (B.H.P.) of the engine. For high-class condensing engines 80 per cent. of the 1.H.P., as shown by the dynamometer, or 85 per cent, for non condensing curines, may be taken as the B.H.P., or a little more in each case if the turbines are very large. If the turbineare directly coupled to electrical generators, as is often the case on land, the H.P. can be deduced from the electrical output. Similarly, in an electric motor, if the electrical H.P. (E.H.P.), which is found by the formula amps. x volts - 10, and the efficiency of the motor is 36 per cent., 3.6 will be the B H.P. of the motor. The power required to operate machinery can be exactly measured by connecting it to an electric motor, either as single units, or in groups driven from shafting. The H.P. of a boiler is an expression for the pressure and vol. of steam required to supply an engine of the same H.P. It is a question of the grate area and heating surface, or, in other words, the evaporative capacity to produce the required amount of steam. For convenience, hollers are often so classed, their H.P. under given conditions being stated by the manufacturers.

Horse-rading. The qualities of speed and endurance for which the horse has always been notable, irrespective of any conscious or artificial process of selection, would naturally suggest the inference that would naturally suggest the inserence that H. is a sport of some antiquity. Such is indeed the case, for classic writers record systematic H. at the Grecian Olympiasis in 600 a.c., while G. Grote, History of Greece, 1846-36, speaks of races for one-year-old coits. A tolerably full historical account of turf matters up to the middle of the numeteenth century will be found in of the nineteenth century will be found in J. Whyte's History of the British Tusf, 1810, from which it seems that the earliest mention of race-horses (or 'running horses,' as they were called) in Brit, national annuls is not till the ninth century ' runuing when Wm. of Mainesbury (q.e.) that llugh Capet in soliciting the hand of Ethel-witha, King Athelstan's sister, in marriage, sent over a present of Ger. 'ronning-horses.' It was not, however, till the reign of Henry II. that horse-mess began to be frequent. They were generally held at Smithfield, which at that time ally held at Smithfield, which at that time was the prin, horse-mrkt, of England. The first race of which a description exists took place, possibly at Newmarket, between animals owned by Richard II. and the earl of Arundel. But in the public favour tournaments and jousts held the first esteem, and by the Tudor period, H. had coased to be a great public amusement. The sport revived under James I., at which time Garterly in Yorkshire, Croydon, and Enfield Chase more James I., at which time Garrery in Yorkshire, Croydon, and Enfield Chase were the customary places for the best races took place at Newmarket, although James I. built stables there near his pulace. In Lincoln (on Lincoln Heath) ann racing began about 1680.

Generally speaking, it may be said that II. owes its position as pre-eminently the national pastime to the royal favour of the Stuart monarchs, especially Charles II. The earlier Hanoverum munarchs do not appear to have taken so kindly to the national sport; but if during that period II. was not the sport of kings, it certainly became that of the Prince of Waks. Prince George, after-wards George IV., owned race-horses in 174 The memory of the late King Edward VII., especially when Prince of wales, will long be cherished as a patron of H. Epsom, which from the fact of the 'Derby' being habitually run there, is probably the most popular recessories in kingland, does not appear to have been the seen of H. till 1618 (see Popy's Parry). The Derby Stakes were insugarated in 1789, but although that race Wales, will long be cherished as a patron. continues to be regarded as the bine mband of the turf, the number of entrants has at times compared unfavour-ably with that in other less classic races where the stakes have often been pecuniarily much more valuable. The St. Leger sweepstakes were instituted by a Colonal St. Leger in 1776, who lived near Boncaster Tn. Mose. The 'Ladies Race' of the Osks first took place in 1779. Ascot. as a popular H. place can trace its blat. from 1711. But practically all the great

ann. steeplechases, like the Grand National, 1 event. the Liverpool, and the Sandown Park Eclipse, began long after the estab. of the

great classic flat-race meetings.

Some occasional steeple hasing across country is traceable, according to the Badminton Racing book, as far back as 1752, Ireland apparently being the home of its early popularity. The term 'steeplechasing' itself merely denotes the fact that some convenient goal like a neighbouring church steeple was selected event. In 1866, as a result of the efforts of Lord Suffolk, Lord Coventry, the duke of Beaufort, and others in the interests of fair play, the Grand National Hunt Committee was formed as the authoritative governing body over steeplechasing, the Jockey Club refusing to assume control over disputes unconnected with flat-enering The recognised rules and regulations of steeplechasing are to be found in Weatherby's Steeplechase Calendar

The Jockey Club is the governing body as a point in the race for the horses to over all matters appertaining to flat-mark on in their cross-country run over racing. Its first existence is variously

Fus Photos THE SCENE AT THE FINISH OF THE 1947 DERBY, WON BY 'PEARL DIVER'

ditches and hedges. (See also POINT TO POINT STERPLECHASES.) Steeplechasing as a regulated sport is not recorded much eacher than about 1829, when plates were put up for prizes, and restrictions placed on the weights of the miders. The sport became increasingly popular some ten years later, when the first Liverpool steepleshape were steeplechase was run round a two-mile course near Aintree. For the first time the conditions of the race were so regu-lated as not only to secure for the spec-tators an uninterrupted view of the race, but to ensure fair play for all the com-petitors. After this, meetings were in-stituted at St. Albans, Aylesbury, and other places, but the contest originated at

assigned to the years 1750 and 1759. The first express mention of it, according to Dey's book on H, occurs in R. Heber's Racing Calendar for 1758, in connection with a regulation passed in that year directing all ridors to pass the scales when directing all riders to pass the scales when they came in, under pain of dismissal. This, however, would seem to indicate that the club had by that time got into full working order, and the tradition of 1750, as the year of its foundation, is further confirmed by the fact that in 1752 a room on the site of the present club buildings was erected and leased to the duke of Ancaster and the marquis of flatings in trust for fifty years as the place for general meetings of the aristo-Liverpool, especially after the seiling race became superseded by the Grand National market meetings, (See also the Badwhich has continued down to the present minton Racing-book.) The Jockey Club day to be the prin. ann. steeplechasing promulgates the rules of racing and

amends them according to the dictates of | (A scale of Weights for Ages will be found the racing world; it also regularly in Ituf's Guide to the Turf) The scale is appoints stewards and defines their pub under the sanction of the stewards amends them according to the dictates of the racing world; it also regularly appoints stewards and defines their powers. The rules prescribe that the full programme of every meeting must be public the names of two or more persons as stewards, and of the various other racing officials—the judge, cirk of the course, handicapper, stakeholder, clerk of the scales, and starter The clerk of the course is solely responsible to the stewards for all general arrangements. The principle of the clerk of the course is solely responsible to the stewards for all general arrangements. The principle of the clerk of the course is to can say, months before the meeting, for entries for months before the meeting, for entries for the races.

Hurdle racing is also a popular form of co. In the early days of this kind of H the hurdles were customanly about 5 ft. in height and had very tightly in the ground, but the modern builde is not above 4 ft high, and is put so lossely in the ground that a horse failing to char it may easily carry it along with him to his own great danger. The whole art of hurdle racing is to take the hurdles smoothly and easily without a perceptible pause either at making the spring or at the hurdles were customaily about 5 ft.

landing.

The prin. flat rating events in England, and the distances are (1 1) The Derby Stakes (1 m. 4 furlongs), 2000 Cunneas (1 m.), 1000 Gunneas (1 m.), 0aks (1 m.), 6 m. hasot Cup (2 m.), 5t. Loger (1 m.), 6 m. longs, 142 yds.), Lincolnshire Handicap (1 m.), Newmarket Stakes (1 m.), 2 furlongs, 3, 48cot Stakes (2 m.), Roval Hunt Cup (7 furlongs, 166 vds.), Gold Vacc, Ascot (2 m.), C'esarewitch (2 m., 2 furlongs), Coronation Cup (1 m.), Coventry Stakes (5 furlongs), Grand Plix de Paris (1 m. 7 furlongs), Nunthorpe Stakes (5 furlongs), Cheveley Park Stakes (6 furlongs), Cambridgeshire (9 furlongs or 1 m.), Dewhurst Stakes (7 furlongs), Champion The prin. flat racing events in England,

iongs), Cambridgeshire (9 furlongs or 1 m.), Dewhurst Stakes (7 furlongs), Champion Stakes (1 m. 2 furlongs), November Handicap (1 m.), Middle Park Stakes (6 furlongs), Free Handicap (7 furlongs), Goodwood Cup (2 m., 5 furlongs).

The season for flat-racing in England is between March 21 and Nov. 22, or there abouts. The rules provide for two races of 1 m. or upwards—not being selling races—for each day's racing, and that no race shall be run over a less distance than five furlongs. It is not often, however. five furlongs. It is not often, however, that a two-mile course is run, though at Age at the Gold Cup course is 24 m, the Alexandra Stakes is 2 m 0 furlongs 85, 3 ds while the Cesarewatch course is 2 in 2 furlongs. The Deiby course has been shortened 29 yds., owing to the rounding of Tattenham Corner, and is now 1 in 4 furlongs exactly. The Derby and St. of Tattenham Corner, and is now 1 m 4 furlongs exactly. The Derby and 5t Leger are restricted to horses three years old, both illies and colts being eligible, and except that fillies have a sex allowance of 3 lb., all the horses carry the same weight. The Oaks is for fillies only "Weight-for-age" races are open to horses of varying ages, horses of equal age carrying equal weights the younger less than the older. Horses of six years and upwards give weight, according to a present of the property of six years and upwards give weight, according to a present of the property of six years and upwards give weight, according to a present of the property of six years and upwards give weight, according to a present of the property of six years and upwards give weight, according to a present of the property of six years and upwards give weight, according to a present of the property of the pr

of the Jockey Club as a guide to tace-meeting managers, but is not intend d to be imperative. The third kind of race is the handleap, which did not become a rignlar feature much before 1820. In handleaps the dida is to equalise the chances by apportioning to each horse the weight which is the opinion of the office. weight which, in the opinion of the official hands appor, will bring them together in a dead heat the rules provide for the due pub of the conditions of any handicap and the date at which the entires close The wights assigned are pub. in the Racing Calendar, and owners who do not agree with this handicap can cut their further loss by declining to acc pt—in other words, by becoming non-taiters.

The controvers, over the forward and

backward seat for jumping has resulted in a marked preference for the backward scat for steeplech using The flat racing seat has also undergone changes, the rider usually rides with short leathers, bunched forward on the horse's neck, with his contractions with many lines and stirrup-irons. the old seat the jockey rode with longer leathers, standing in the stirrups. The Amer jockey, Tod Sloan, first introduced the new seat into Lugland

Betting -All contracts or agreements by way of gaming or wagering are null and void by the Gaming Act of 1845, and securities like cheques or bills of exchange given for money lost on wagers are void under an Act of 1711 (In the case of 1) oolf v Hamatton, decided as late as 1898, it was held that H had always come under the wagers contemplated by the Act of 1711) Contributions or subscriptions or agreements to subscribe or contribute towards any plate pure or sum of money to be awarded to the winner of any lawful to be awarded to the winner of any lawrin sport (including, of course, H) are expressly excepted from the operation of the Gaming Act, 1845 (see also Berling, Contracts, Guning, and Gambling) The business of bookmaking is only illegal if carried on in contravention of the Betting Act, 1803, which Act prohibite the keeping or using a house or other place for betting purposes, and the whole question turns on the judicial construction of a place within the meaning of the Act It has been held that I etersall's enclosure is not such a place that word apparently is not such a place that were apparently bring construed cyu-dem generis with house, office, or room Betting is permitted with a bookmaker who acts as an agent for his client, and with whom accounts are settled weekly. The tote, a mechanical betting machine, is now

Jockey Club with headquarters at Bois- | machinery and ladies' clothing manuf. fort, while race-meetings were held at Antwerp, Ostend, Bruges, and Spa. H. was also making considerable strides in the E., particularly in India and Malaya. Foreign-owned horses are allowed to com-Foreign-owned horses are allowed to compete in Eng. races, but so far a similar privilege has not been extended to the horses of Eng. owners on some foreign courses. Eng. racehorses, however, are sought after by foreign buyers for breeding purposes. See Ruff's Cuide to the Turf; H. S. J. Bourke, Horse Training, 1928; J. Hislop, The Turf, 1949.

U.S.4.—In what is now the U.S.A. H. in the beginning was largely confined to the S, states whose settlers were chiefly Brit. and brought with them the habits brit.

Brit., and brought with them the habits and traditions of the home country. When New York became a Brit. instead of a Dutch colony, II. was introduced there, and that state is still the locale of some of the best race-tracks in the country.
Before the Civil war New Orleans was
famous as a racing centre. Kentucky is
pre-eminently the race-horse breeding
state. The section near Lexington. known as the Bluerrass region, is filled with stud farms, and Kentucky horses are with stud farms, and Kentheky horses are excelled by none. The best-known tracks are Belmont Park, Aqueduct, Empiro City, and Jamaica near New York City, the one at Saratoga, New York, four near Baltimore, four near Chicago, Churchill Downs in Louisville, Kentucky, and Latonia in Kentucky, opposite Cincinnati. Most of the tracks in the U.S.A. differ from those in Great Butane, in that they are discussed in the tracks in the U.S.A. differ are circular, and the turf has been re-moved, the roadway being made of dirt. In recent years the totalisator, known in the U.S.A. as the Parimutuel, has been installed in many race-tracks by state law, the state getting a percentage of the receipts, and bookmakers being barred.

Horse-radish (Cochleana Armoraria), cultivated plant belonging to the natural order Crucifene. The root has a strong pungent taste which closely resembles mustard, and is used either grated or made into a sauce, as a condiment with beef.

Horse-shoeing, see FARRIERY.
Horse-tails, see EQUIPERI'M.
Horsforth, tn. situated in the W. Riding of Yorkshire, England, 5 m. to the N.W. of Leeds. It manufs, woollen goods.

Pop. 12,200.

Horsham: (1) mrkt. tn. in the co. of Sussex, England, lying 18 in. N.W. of Brighton, and about 36 in. S.S.W. of London. Among its buildings of interest are the old church, which has been restored, the grammar school, and corn exchange. The chief industries are tan-ning, brewing, iron-founding, and coachbuilding. Here also is situated Christ's Dullding. Here also is shuased Christ of Hospital, which was moved from London Pop. 21,000. (2) Th. on the Wimmera R. approximately 200 m. N.W. of Melbourne, Australia, centre of the Wimmera dist., the largest wheat growing area of Victoria. The th. has a very modern the control of the Wimmera dist. hall (seating 1000), 7 churches, base hos-pital, and a High School, and State School. The chief industries are flour milling, agric. implement foundry, textile

Other primary products associated with the tn. are wool, fruit, tomatoes. Pop. 6500.

Horsley, John Calcott (1817-1903), Eng. artist, b. at Brompton, Loudon. in 1856 he was elected an R.A., and from 1882 to 1897 he was treasurer of the Academy.
His best works are those dealing with
everyday life. Among his works are
'Rent Day at Haddon Hall.' 'Canght
Napping,' L'Allegro, Il Penseroso,' and
'The Healing Mercles of Christ'—the
altar-piece in St. Thomas's Hospital

chapel.

Horsley, Samuel (1733-1806), Eng. pre-late, b. in London, and educated at Westminster School and Cambridge. In 1759 he became rector of Newington, a living which he held till 1793. He devoted a which he held till 1793. He devoted a great part of his time, however, to a controversy with Dr. Priestley on the doctrine of the divinity of Christ. Among his other preferments may be mentioned that of hishop of St. Davids in 1788, Rochester in 1793, and St. Asaphs in 1802. He ed. the works of Sir Isaac Newton (1785). See J. Priestley, Tracts in Controversy with Horsley, 1815; R. Hall, Hemarks on Horsley's Sermons, 1819.

Horsley, Sir Victor Alexander Haden (1857-1916), Brit. surgeon and neurologist, b. at Kensungton, London. He was prof. superintendent of Brown Institution 1884-90; secretary to the Royal Commission on Hydrophobia, 1885; surgeon

1884-90; secretary to the Royal Commission on Hydrophobia, 1885; surgeon to the National Hospital for Paralysis and Epilepsy, 1886; Fullerian prof. at the Royal Institution, 1891-93; president of the Pathological Section of the Brit. Medical Association, 1892-93; prof. of pathology, Univ. College, 1803-96. From 1906, he was Emeritus prof. of clinical surgeons and conventions environmental links. surgery and consulting guizeon at Univ. College Hospital. One of the leaders of the medical crusade against alcoholism; and author, in collaboration with Dr. Mary Stinge, of Alcohol and the Human Rody (1917). Body (1907). Among his other works are: heremments upon the Functions of the Cerebral Cortex (1885), Iran Surgery (1887), Hydrophobus and its Treatment (1888). While serving as consultant with forces in Mc-opotamia he suffered heatstroke, and died at Amarah.

Horst Wessel Lied, rallying song of the Ger. National Socialist or Nazi Party, the words of which were written by a student, Horst Wessel, who was born in 1907 and was killed in 1930 in a Communist-quarter of Berlin where he lived and commanded a section of the Abledung or Storm Troopers of the Nazis. No certain details Troopers of the Nazis. No certain details exist of the precise manner of his death, but sev. persons suffered death, for their supposed implication in it, at the hands of the Gertapo. The song was sing to the time of a minic-hall song which was popular amongst the troops in 1914.

Horta, cap of the is. of Fayal, belonging to the Azores group. It is situated on the S.E. coast of the is., and is also the cap. of the dist. of H. Pop. about 7000; dist., 53.700.

Hortense Eugénie de Beauharnals (1783-1837), queen of Holland, the daughter of the Empress Josephine by her daughter of the Empress Josephine by her first husband, was born in Paris. In 1802 she married Napoleon's brother, Louis Bonaparte, king of Holland. On the fall of Napoleon and his family in 1815, she field to Switzerland. The youngest of her sons afterwards bocame Napoleon III. See T. A. Taylor, Queen Hortense and her Friends, 1907; Mile. Cochelet, Mémoires sur la reine Hortense et sa famille, 1907; J. Hanoteau (ed.) Mémoires de la reine Hortense publiés par le Prince Napoléon. Hortense publics par le Prince Napoléon, 1927.

Hortensius, Quintus (114-50 B.C.), surnamed Hortalus, was, after Ciccro. the most famous of the Rom. orators. He was the son of Q. Lutatins Catulus, and so belonged to the ari-to-ratic party. He supported Sulla in the civil wars, fought during two campaigns (90-89) in the Social war and become curvall in 69 B.C. guring two campaigns (190-89) in the Social war and became consul in 69 B.C. In 63 B.C. he came into conflict with Cicero and, on Pompey's return from the E. in 61 B.C. retired into private life. His apoeches are not examt, but are described by Cicero as Asiatic and florid in style.

by Cicero as Asatic and flotid in style. Horthy de Nagybanya, Miklos, Hungarian admiral and regent; b. 1805, of noble family at Verd in Szolnok comitat. Studied at naval academy, fiunc. Recame A.D.C. to Emperor Franz Josef, and served in naval dept. of war ministry, Vienna. In the First World War, commanded cruiser Norura attacked Italy at Pouto Corsini, San Giovanni di Medua, and Otranto. Severely wounded in last-mentioned ongagement, May 14, 1917. When peace came, H. was placed in command of the navy of the dual monarchy: when that monarchy fell, he monarchy: when that monarchy fell, he returned to Hungary; and, after the collapse of Bole Kun's Gov., he organised its anti-Bolshevik successor—entering Budapest, 1919 and assuming the title of Indapes, 1919 and assuming the title of Administrator of the Realm' (1920). In Feb. 1920 he was elected regent of Hungary by the nutional assembly. Twice in 1921 he used force against the ex-Emperor Karl (Charles I.), who attempted to become king of Hungary. He rose to power as the safeguarder of the Hap-burg Monarchy, but kept his position as protector of the interests of the big landowners. Described by Count Karolyl as the ' Hungarian Quisling,' he was the first to introduce fascist methods in Hungary and promoted a rapprochement with Italy. He supported whole-heartedly Ger. militarism, because Hungarian landlords always needed the help of Germany to carry on successfully a reof Germany to carry on successfully a re-actionary policy. As a reward for stab-bing his ally Yugoslavia in the back in 1941 he secured purts of Transylvania, Slovakia and the Banat but soon found that he had forfeited Hungarian inde-pendence. His regency ended in 1941, Horticultural Colleges, see HORTICUL-

kng. Congregational minister. b. London, and educated at Shrewsbury and New College, Oxford. In 1877 he was president of the Oxford Union, and in 1879 he became fellow of New College and lecturer on hist in 1880 he was appointed pastor of the Lyndhurst Road church, Humpstead In 1886 he was the chultrum of the London Congregational Horticultural Colleges, see Ho Creed (1895), and The Teaching of Jesus (1895). The Trinity (1901) and Pastoral Epistles (1901), The Holy Spirit (1907). The Early Church (1908), Great Issues (1910). Horton, Sir Max Kennedy (b. 1883), Brit. admiral. He entered the Royal Navy at the age of seventeen and served in submarines during the Eirst. World

Navy at the age of seventeen and served much may be acceded and the name Hor was the common much and the Legion of Honour. He was promoted to Captain in 1920 and commanded the 1st Submarine Flotilia, Atlantic Fleet, 1922-24. In 1926 he went to the admiralty as Assistant Director, Mobilization, and in 1928 served for two years as Chief of Staff to the Commander-in-Chief, Portsmouth. In 1932 he was appointed Rear-Admiral, commanding tites. Pop. 14.900.

i.e. 'Hor the child,' when he is represented as seated on a lotus-flower with his finger in his mouth, perhaps as a symbol of socrecy and silence. The name Hor on sorrecy and stience. The name Hör was also prohably applied to lesser divinities, but to all forms the falcon was held sacred, and the name Hör was the commonest title of the king in the earliest dynasties. The N. kingdom in particular was under the parteners of H.

2nd Battle Squadron (1933) and 1st (ruiser Squadron (1935); in 1936 Vice-Admiral, commanding Reserve Fleet (1937-39). At the beginning of the First World War he became Vice-Admiral, Submarines, and many early Brit. successes in the submarine warfere were due to his efforts. From 1942 until the end of the war he was Commander-in-Chief, Western Approaches, and was largely Western Approaches, and was largely responsible for the success of the counter-offensive to the German U-boat campaign. H. retired at his own request in Nov. 1935. Orders conferred on him in the course of Orders conterred on him in the course of his long and successful naval career include C.B., 1934; K.C.B., 1939; G.C.B., 1945; Orders of St. George and St. Anne (Russia); Grand Cross of the Order of Orange Nassau (Netherlands); Commander of the Order of the Redeemer (Greece). It holds the silver medal for caving life on the occasion of the loss of regreece). He holds the silver medal for saving life on the occasion of the loss of the P. & C. steamship, Delhi, which ran aground off Cape Spartel Morocco. Nov. 13, 1911. In Jan. 1946 he was appointed Bath King of Arms of the Order of the Bath.

Horus Sicous, see Herbarium.

Horus (Egyptian Hör), in anct. Egyptian mythology, was the sun-god and equivalent to the Gk. 'Apollo.' He is sometimes identified with Harpokhrates, He is

Hosanna, shout of praise and adoration used by the multitude at the triumphal entry of Jesus into Jerusalem (Matt. xxi. 9).

Hosea, first of the twelve minor prophets according to the Biblical order. Nothing is known of him beyond what is told us in the Book of II. From this we learn that he was a native of the N. kingdom of the Wall and that his father's narrow learn that he was a native of the N. king-dom of I-rael, and that his father's name was Been. The period of his prophedes is given in the first verse: 'In the days of Uzziah, Jotham, Abaz, and Hezekiah, kings of Judah, and in the days of Jero-boam the son of Joash, king of Jerael,' Since the last-named king d. during the life of Uzziah, those dates are not in full agreement. The prophecies fall into two parts: (I) Chapters 1-3, which tell the story of the prophet's marriage with Gomer the daughter of Diblain, a profligate woman, and of the birth of his three children, to whom allegorical names are given (i. 4, 6, and 9). The application of this story 6, and 9). The application of this story is then made to the relations between Yahweh (Jehovah) and his people. (2) Chapters 4-14, wherein he denounces more fully the particular sims of unfaithfulness committed by the Israelites against Yahweh, such as their introduction of idolatrous ceremonies and their alliance with and trust in foreign nations. The

question as to whether the account of the prophet's marriage is truly biographical, or is merely introduced to give point to the later accusations has been much dis-cussed. There seems to be no sufficient reason why it should not be biographical There are some interpolations such as (1) those passages which extend the application of the prophecies to the S kingdom of Judah (2) those which interrupt the of Judan (2) those which interrupt the denunciation to speak of a period of final happiness See A linson, Der Prophet Hosea, 1851 W R linth, I wate Minor Prophets, 1876 and studies by S L Brown, 1932 L 1 Birns, 1322 G (1 Morgan, 1934, R H W heeler, 1948 also north by W Nowack A State and R. Hosiery in its limited sense refers to the manuf of stockings (liose) but the term is used to designate all textule fabrics which are manufactured on the looped wcb principle and knitted goods, whether

we of principle and annual goods, whether made by hand or machinery.

Hand Initing requires very few and simple implements, consisting of two or more straight needles. On to these an indefinite number of loops are cast, made of one continuous thread of yarn which is passed through the previously loops to make fresh series, and left hang bont, wood or plastic and of any length or thickn . If only two are used the fabric will have a solvedge on both sides if three or more are employed a circular web will be formed. See further under KNITTING

I rame work knilling, was introduced by the Rev W Lace when he invented the sto king frume in 1589 This frume thing d from the principles of hand knilling in having a separate needle for knitting in having a soparate needle for each loop instead of casting all the loops on to one needle. Fach needle consists of a shink with a spring pointed hook which can be pressed into a socket in the shank. The following diagrams are to show the formation of the knitted loop with that the peof needle all other machine patts have been omitted to give a clear view of the stitches and needle. Fig. 1 how the new row of loops being formed whil it the fabric is hid lower down the needle. In Fig. 2, the needles have been needle In Fig 2 the needles have been lowered to allow the loop into the hook of the needle In he hook has been closed and is till descending into the loop of the privious row of stitches. Fig. 3 shows the o'l loops rising above the needles and descending on the new loops which are still held in the hook of the needle lig 4 shows the needles rising to their original position with the new row of loofs sliding down the shauk of the

not die The first fabric made by Lee was a flat picce with selvedge on both sides from which the garment had to be cut to hape and sown up but he soon learned to fashion by transferring loops at the edges, in wards to narrow and outwards to widen In I ce's machine the thread had to be laced over the needle by hand and it was not until 1857 that Luke Barton invented the first successful machine fitted with self acting mechanism for fushioning knewn as the straight bar rotary frame

Il arp knutting varies from frame work knitting in having a separate thread for ca h needle instead of the same thread for th whole row. By the invention of the Dawson whice (1791) the threads can be laid in any direction and thus give greater sc pe for variety of design in patterns and colour which make this form of knit ting specially suitable for household fut rice

Circular knilling was made possible by a n thino patented by Sir Marc I Brunel in 1816, which he called the tricoteur This produced a tubular web but did not come much into use till improved upon by Peter Claussen of Brussels in 1844. The pro-

circular fabrics. The seamless stocking (as made on the circular machine) is woven in strong formation : e in endless succession whereas on a fashioned knitting-machine each hose is in ide and cast off

machine each hose is in ide and cast off the work was the first variation of the plain fabric produced in Lees machine, and was produced by an invention of Jededith Strutt in 1758, by which a second set of needles, placed at light angles to the first, dr w their loops to one side, while the first set of needles drew theirs to the other side of the frame Lee's frame had only sixteen needles for a single modelly mything have as in wherea modern machines have as many as 120 needles for a in Some of the most modern knitting frames work at a great special One with flurty dives of 476 medies each has in all 11 230 medies, each of these form loops at the rate of 50 in a minute so that 1,142,400 loops can be tormed in a minute (the speed of an expert hand knitt i is 100 loops per minute)

The materials used in hosier varocotton, wool, salk and many varying varies such as Rayon and valon. In the trade the term 'stocking is obsolete and sock is used only for childing H. Mens socks are called half hose and lince length H is known as three-quarker has the two chief methods of man t are seamless and fully fashume! (Many great London and provincial Hs. were seriously damaged by Gur. air-raids in 1910-44. See further under London, etc.)

Administration.—In the Brit. Isless

Administration.-In the Brit. many Hs. were, until the National Health Act came into force in 1918, largely supported by voluntary contributions, whilst on the Continent and in the United States on the continent and in the United States these institutions are, for the most part, supported and controlled by municipalities. The rate-supported H. in England formerly almost confined to fever and smallpox H., a few ambulance stations, and some homes for sick and convelescent children both in the country and at the reside were supported in 1927. and at the seaside were augmented in 1927

by the inclusion of the l'oor Law Infirmaries ('workhouse' H.).
Sir Wm. Fergusson's Commission on Hospital Abuse (1871) made the following recommendations which are here quoted as indicating deficiencies previously existing in our H. system: (1) to improve the administration of poor-law medical the administration of poor-law medical relief; (2) to give the poor-law authorities control of all free dispensaries; (3) to check the unrestricted system of free relief; and (4) to pay the medical staff. It is well estab, that a considerable number of people who were able to pay availed themselves of free treatment, which was only intended for the poor, and pay wards are now attached to all large H., the patients admitted to them large H., the patients admitted to them giving fees according to their social status. Since 1909 almoners have been appointed in certain H. to decide whether or not applicants for medical assistance are in a position to contribute towards its expense. Since 1948 this work has become un-necessary, since H. treatment is now available to all under the National Health Act, but II. almoners still have important

and are remarkable in the great advance shown as to the place of H. service in the state. The scheme was discussed in 1927 by the Brit. H. Association.

1. Domiciliary, including curative and preventive treatment. Staff: doctors, pharmacists, nurses, midwives, health visitors, and other officers of the Health

authority.

2. Primary Health Centres, including medical, surgical and maternity beds, out-patient clinics, dontal clinics, accommodation for equipment needed for treatment and investigation, accommodation for the work of communal services, ambulance service. Staff: general practi-tioners, visiting consultants and special-ists, officers engaged in communal services, visiting dental surgeons, workers in an-

ciliary services.
3. Secondary Health Centres, including facilities in curative services in cases requiring highly specialised diagnosis or treatment. Staff: consultants and spec-ialists, officers of communal services, dental surgeons, workers in ancillary

services.

4. Supplementary services, including facilities for apecialised treatment of such conditions as tuberculosis, mental disease, etc. Staff: appropriate specialists and workers in ancillary services.

5. Teaching H. and medical schools for cases of unusual difficulty; including facilities for research and post-graduate study. Staff: consultants, teaching and research staff, workers in ancillary services.

6. Research: clinical records.
7. Adminstration: The estab. of a single Health authority to supervise local administration whether curative or prerentive. Representation of the medical profession on each authority and the estab. of Local Medical Advisory Boards.

A further step forward was indicated by Mr. Neville Chamberlain as Minister of Health in 1927 whereby by special legislation Poor Law H. were to be transferred to the nunicipal authority. This measure had the very important results of removing the stigma of penury from Poor Law patients and allowing all classes to become eligible for institutional benefit.

The prohibitive charges of most private Nursing Homes have led some II. to conduct depts, for private patients with fees which are within the means of the middle

and lower middle classes.

Busides the pressing need for co-ordination of H. services the financial position recently became increasingly urgent. It was evident that the voluntary system was inadequate to supply the necessary income and many of the voluntary H. functioned with restricted accommodation as a result. Local authorities act, but it almoners suit nave important.

The rapid growth in the number of H. in recent years has emphasized many problems both of finance and administration, and in order to meet them the following recommendations were made by the Medical Consultative Council in 1920 and pub. In their report. They originated with a scheme of combined medical serclaimed and many patients were therefore asked to guarantee payment of costs before admittance, a procedure which was contrary to the object for which the H. operated.

Voluntary Hoganials under the National Health Service Act, 1946.—This Act introduces drastle changes in the system of voluntary H.; for in effect it nationalises the existing H and such future H. as may be required. The Act imposes on the minister of health the duty to provide throughout the United Kingdom such H and specialist and nursing services as may nicet all reasonable requirements. The former honorary staff are paid for their services Spicial accommodation may be provided for private patients who undertake to pay the prescribed charges, which are designed to cover the whole cost of the accommodation and services provided for the patient at the II, including an appropriate amount in respect of overhead expenses, and the minister is empowered to sue for the amount. Included in the H. and consultant services are all forms of general and specialist H. care and treatment, both in patient and outpatient. Specialist opinions and treatment of all kinds are to be made available ment of all kinds are to be made available at H. (as well of course at clinics, institutions health centres, etc.). For this national service the minister of health will take over both voluntary and public H. Supplementary services, such as midwifery, maternity and child welfare will be provided through the local authorities. In introducing this Bill, the minister of health, Mr Ancurin Bevan, admitted that the voluntary H had done valuable work. the voluntary II had done valuable work, but he believed that 'it was repugnant to a civilised community for Hospitals to have to rely on private charity.' The gov. rejected the idea that local authorities should take over the H. and considered that the only thing to do was to create an entirely new II service, to take over voluntary H. and local goy H and to organise them as a single H. service to organise them as a single H. service throughout the country, with the nation itself carrying the eye inditure. In the early years, the gov. estimated the cost at £152,000,000, the net ann additional exchequer expenditure being placed at £95,000,000, after allowing for a contribution of £32,000,000 from the National Insurance Fund. Regional Bearies to Insurance Fund. Regional Boards to administer the H. and specialist services will be set up in about a score of regions, each large H. or related group of H. having a management committee. Except in the a management communete: Except in the case of voluntary teaching H., endow-ments will pass to a new fund called 'the Hospital Endowments Fund,' which the minister of health will administer, the cap, value of the fund being apportioned among the regional boards and the income from each portion passing to the board.

The Act provides that where any volun-The Acc provides that where any voluntary H. is designated as a teaching H. or for the patient a journey through the open is one of a group so designated, all the H. are but the modern operation suits is endowments will be transferred to a planned as part of the surgical block, near Board of Governors constituted in the manner provided in the Act. Endownents given after the passing of the Act has no fewer than nine parts, including the form of the surgical block, near the wards and is diplicated (or multiments given after the passing of the Act has no fewer than nine parts, including instrument room, dressing rooms,

day, upon trusts which provide for the application of the property for some specific object distinct from the general purposes of the H. and for administration as a distinct cap. fund, will not be transferred to the H. Endowments Fund but to the H. Management Committee constituted under the provisions of the Action that H. as recovered M. In relief to the for the H. or group of H. in which it is comprised.

Architecture .- A H., viewed as a number of wards, each containing so many beds, with kitchens and other offices within ea-v reach of wards, is a simple building in conception, and there has been only one really important change of plan in ward crection during the last 200 years. The old method provided windows on one side of the ward only, and is well illustrated by the older blocks of the two London H. Guy's and St. Bartholomew's. In each there is a central entrance and staircase and two long wards on each side, making four in all, on each floor Thus, each ward is lit by a single row of windows, down its length, and possibly by one or two windows at the end. In the new method in order to get the most light and are such ward how sufficient as heat date. air, each ward has windows on both sides The architectural problems of the H. are by no means limited to the building of the the arcintectural problems of the h. are by no means limited to the building of the wards, and in particular, the H in a large city should be connected with a univ. or have a medical school attached to it, so that it may take advantage of modern scientific freatment and research. A H in this case (to borrow the claim of one great institution) is a 'city within a city,' its div is 21 hrs., it is a bread bakery, a power plant for the manuf of current, a liundry, a college with lecture theatres, a labor story for scientific research, a ware house that stocks cotton wool by the ton, a museum and a gymnasium. It has itstire great depta. : Medical, Surgical and Out Patients, and has many rooms and wards for X-ray treatment and X-ray research work. Many of those depta dividing a the hospital grows, but in America during the last fifty years the sciencisty of wealthy philanthropists has son ctimes enabled the boldest schemes to be carried out as a whole, though the son crimes enabled the poldest schemes to be carried out as a whole, though the speed with which medical science advinces rarely leaves such work unaltered. The new addition to a li in any great country is probably the best of its kind of thult. The new blocks recently built at high Bartholomer's in London, for example, as far as human skill makes it possible combine the advantages of all possible, combine the advantages of all privious architectural experience. This may be exemplified in the treatment of surgical cases; when new hygienic rules revolutionised the old operation rooms the operation theatre was usually built in any convenient corner as a separate three 100m erection and was frequently far from some of the wards, thereby involving

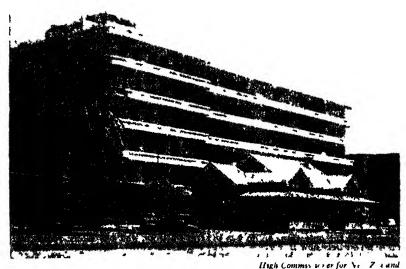

sterilising room operating theatre and a century ago (Liston amputated a leg anaisthetising room, where, in agreeable under other at University College H. in surroundings the feelings of the patient [1818] secondly Lister's introduction of need not be harrowed by the sight of any surge al apparatus before the administra

tion of the anesthetic

History—It is no exaggeration to say that until the eighteenth century the sick could only be cared for at home or at least in private houses. As late as 1710 St. I homas's and St. Bartholomows H. were the only asylums for the set. in London, and in the provinces such institutions primarily Christian institutions l gyptian

autiseptic methods at Glusgow Royal Infirmary in 1865 puring the way for modern asserts, thirdly the improvement in the standard of nursing as a result of Horence Nighting de's pioneer chorts at scutair in the Crima and later in her nursing school at St. Thomas' H in London

Hotham, William, first Lord (1736-1813), Eng. naval officer. He entered the navy in 1718, in 1751 sailed to N. America, and ultimately served in the W. Indies. He took part in the defeuce of Sandy Hook and Ithodo Is. under Lord Howe. H.'s actions against the Fr. off Genoa and off Hvères (1795) were adversely criticised by Nelson in his letters. Hotham, Mount (alt. 6100 ft.), one of the highest peaks in the Barry range, Victoria, S. Australia, about 135 m. E.N.E. of Melbourne.

Hothouse describes a glazed and heated structure used in horticulture for growing plants out of season or in colder climates by allowing close control of temp., venti-lation and light to be exercised. Glazing lation and light to be exercised. Glazing extends to roof and all sides, and may be, with equal efficiency, of clear or semi-ob-cured hortic, glass. If a tenant's struc-ture, it must be unattached to ground, perture, it must be unattached to ground, permanent walls or buil laws, espuble of being dismantled and portable, but it may rest on a loose brick, not cemented, foundation. The three common types are: Span roof, ranging from the single span garden greenhouse to the many-panned commercial glasshouse, creeted with ridge running N. and S. to admit maximum sunlight; three-quarter span roof, preferably built adjoining a S.W. or S. wall; and the single span lean-to roof, similarly situated. The smallest economic size for equable heating is probably 12 ft. x 8 ft. Site must be sunny, on 12 ft. x 8 ft. Site must be sunny, on well-drained soil, and foundations well-drained soll, and foundations draught-proof. Heating equipment depends upon the minimum winter temp, to be maintained. Tropical or semi-tropical plants and vegetables require much higher temps, than temporate flowers such as primulas. A house in which the night temp, in winter does not full below 10° F. in the severest weather is termed a cool greenhouse. It is suitable for the raising of such plants as alonson, begonia, cal-ceolaria, carnations, celosia, cheruria, colous, cyclamen, diasca, francoa, gerbera, coleus, cyclainen, diased, francon, gerberg, glozinia, grevillea, petunia, rhodanthe, schizanthus, streptcorpus, swect pes, verbena, zinnia, ctc., from seed; chrysanthemum, coleus, cytisus, fuchsia, hydrangea, oleander, pelargonium, plumbago, salvia, and solanum from cuttings; and most bulb species from corms or offsets. A warm or stove house is one in which a minimum winter temp. of 60° F. be forced, vegetables grown out of season, and plants raised from seed or cuttings for later planting out of doors. The range of tender flowers that can be grown include achimene, allamanda, amryliis, anthurium, bougainvilica, bouvardia, caladium, clerodendron, croton, dipladenia, his life in lecturing and writing.

fumeless oilstoves, gas or electrical ap-paratus. Gas and electrical heating offer the advantage of thermostatic control, but are seldom practical at an economic cost for the maintenance of forcing temps. The most economic heating equipment conrists of hot water or steam pipes extending along the sides, etc., of the house, together with a furnace or slow-combustion stove. This may be oil or gas-fired, but solid fuel, coke or anthracite, is most economical today. Techniques of soil-warming by electric cable or wire may be utilised with advantage in most houses. The aim of ventilation is to change the air without draughts. Roof ventilators are essential. Stage ventilation at the side of a house is rarely needed in winter, but helpful in summer. Sub-stage ventilators admitting air on to heating pipes are good for winter use. A constant water supply is essential in 114., and may be arranged by gutters and pipes draining into a lidded cistern sunk to floor level inside the structure. Modern houses of steel, aluminium or alloy construction are less costly to maintain than wooden, but care should be taken to see that facilities for supporting plants by training wires or strings are provided. by training wires or strings are provided. Whether grown in pots, boxes, or borders. H.-grown plants require well-balanced, fertile soils. Making up of soil composts for seed-growing and potting is simplified by use of formulæ developed by John Innes Hortic. Institution, Merton Park, London, S.W. 20. Freedom from soil-borne plant parasites, fungal or insect, is assured by soil sterilisation, preferably by heat or the use of a 2 per cent solution of heat, or the use of a 2 per cent solution of formaldehyde. Proper regulation of temp., ventilation and watering assure maintenance of buoyant atmosphere. ance of buoyant atmosphere. Watering should be done early in the day to ensure plant foliage being dry when the house is closed at night. Insect control has been revolutionised by the development of new smoke generators. D.D.T. smoke controls adult white-fly, tomato moth caterpullars, woodlice, and capsids. Azobenzene Smokes eliminate red suider Azelnet Smokes eliminate red spider. Against aphides, thrips, and scale, nicotine is most effective. Mildews, teaf mould and other fungus diseases require the use of sulphur or copper fungicides. Plants vary in their tolerance of smoke or fundgating treatments, and this should be ascertained beforehand. See F. J. Fletcher, Class-houses and Propagation of Plants, 1948. Hotin, see KHOTIN.

Hot Lake, dist. in the N. is. of New Zealand, stretching S.W. from the bay of

Plenty, and containing hot springs, gevers, and active volcanoes.

Hotman, François (1524-90), Fr. publicist and jurist, of Slesian origin, b. at Paris, son of a counsellor of the parliament of Paris. Studied law and began to practice at the Paris har, but thereafter spent tise at the Paris bar, but thereafter spent

first let turer in Roman law at Paris Univ. Having embraced Calvinism he went to Geneva and thence to Lausanne, where he Geneva and thence to Lausanne, where he was prof of belies-lettres. From 1550 for some years he lectured at Strasbourg and then attached himself to Anton, of Navarre, boing entrusted with missions from the Huguenots to German princes. He succeeded Jacques de Cujis (9 r) at Bourges, but the civil war drove him into flight, to Orie was whence he was sent to Blois to arraise the peace of 1568—life suffered greatly during the Huguenot per secutions and again sought refuge, this time. secutions and again sought retuge, this time at Sancerre, where he wrote has a work drawn from the hible and stangustine. After the massure of st. Bartholomey he field to General and turned his back on France forever, having written his famous Lat political treatise, the Franco Gallia (1573, trans. 1774) At Geneva he was appointed prof. of Roman news are was appointed provide that have but he never found peace and event pally, in 189, he fied to Basel, where he died and was buried in the cathedral there. His prin, work, the I rane stalling doubtless aimed at Charles IX, was nover no pulsar with his to relicents and was popular with his co-religionists and was also much censured by the Catholics In it he represents the institutions that the Huguenot party demanded as being those which for long governed lines, and which alone could retrieve her prosperity According to H, these ale il institutions could be traced to the listory of Gaul and the old Frankish monachy and to the later federation of free states formed by the peoples of Gaul in (can a time, under the peoples of Gaut in C can if the the the agencial Assembly of cletted deputies—a federation which, after the Conquest of Gaul by the Franks, was replaced by an elective monarchy, beginning with Childric in which the king could be deposed by the States-General composed of nobles. magistrates, merchanty and artisans, the clergy forming no order and exercising no power. This work breathed the true spirit of research and of Hugue not independence, and the sensation it caus d has been compared to that produced by the Contral Social of Rousseau II was a man of unquestion able piets and lotty ideas on a ligion, and his frequent tights, which a nebt seem to savour of cowardice, were really due to fears for his wife and family. Hospital. Pop. 3/14.
Hound's-tongue, name given to various species of the boraginaceous genus Cynogloseum. The plants grow in tropical and temperate lands, and two grow cai and temperate lands, and two grow wild in Britain. Of these the better-known is C. officinale, the common if., which grows on waste ground, and was formerly used in medicine. It grows to a height of 2 ft., has downy leaves, and bears red flowers.

Hounslow, tn. in Middlesex, which stands at the junction of the two great W. of England roads from Bath and Exeter, and is about 14 m. from London and 24 m. from Brentford. H. Heath, W. of the tn. was the site of Rom. and Brit camps, and was also a favourite resort of highwaymen. It is now used as an exercise ground for troops. From 1918 it was the continental air port for London till this was transferred to Croydon in 1920. The large cavalry barracks built in 1793 is the chief military depôt for Middlesex. A priory of friars of the Holy Trinity was founded at H. in 1296, and the chapel was used as a church

until 1330, after which the present church of the Holy Trinity was built. H. is now part of Heston—Isleworth. Pop. 23,600. Hour, twenty-fourth part of a day. In most countries the Hs. are counted from midnight, and two twelves are reckoned. but in certain parts of Italy twenty-four out in certain parts of Italy twenty-four Hs. are counted, beginning with sunset, so that noon and midnight occur at different times each day. The 23-H. mode of reckoning 1: used in the Brit. Army. Whitaker's Almanack, etc., e.g., 12.5 A.M. is reckoned as 0005 H., 11.50 r.M. as 2350 Hs. kach H. is divided into 60 mins. and each min. into 60 secs. Many nations e.g. Gka. Jews and Habytonians were not

'Apostle of the North,' who was rector into equal parts, but into unequal or here, and also founded the grammar planetary Hs., and double Hs. of 120 min. school. Pop. 28,100.

Hour-angle, angle made by any H.-circle with the meridian of the observer. For example, when the sundial at a certain spot registers ten o'clock in the morning, and the sun is therefore two hrs. distant from the meridian, the hr.-circle makes an angle of 30° with the meridian. Hour-circle, in astronomy, any great circle drawn through the poles. The fixed

stars complete their apparent revolution round the earth in twenty-four hrs. of sidereal time, passing through 360° in suceren time, passing through 360° in twenty-four hrs., i.e. in 15° one hr. If, therefore, two observers are 15° of long, from each other, one has any fixed star one hour of sidereal time later in his merdian than the other. Meridians in dialing are known as 11°.

dialing are known as Hs.

Hour-glass, instrument for measuring intervals of time which consists of two glass bulbs joined by a narrow neck. One of the bulbs is almost filled with sand or mercury, which passes through the narrow aperture to the other bulb in the space of an hr. if an H., or of a min. if a min. glass. This device was frequently employed in churches during the sixteenth and seventeenth centuries, and in the Fing. House of Commons, as a preliminary to a div., a two-min, sand-glass is still turned.

Houri, name for a beautiful damsel endowed with perpetual youth, whose companion-hip in Paradice is the reward of devout Moslems after death. The word comes from the Persian huri; Arabian

haura, a black-eyed virgin.

House, Edward Mandell (1858-1938), friend and adviser of President Woodrow Wilson, was b. at Houston, Texas, U.S.A. He was the son of an Englishman who emigrated to Texas when that ter, was still part of Mexico, and who took a large part in lighting Mexico. He was educated at Cornell Univ., and then returned to his native state, where he made a comfortable fortune from his plantations and other business ventures. Although he never ran for office himself, he took a keen interest in the politics of Texas, and was largely instrumental in the nomination largely instrumental in the nomination and election of a number of its governors and senators. II, was a progressive Democrat. When Woodrow Wilson was prominently mentioned for the Democratic nomination for the Presidency in 1912, II, paid a visit to the then governor of New Jersey. The two man found that they thought alike on public questions and policies, and a friendship was begun which was to lest without a break until which was to last without a break until the closing months of Wilson's life. When with the crossing months of whom after. When is reckoned as 0005 H. 11.50 F.M. as 2350 Hs. Each H. is divided into 60 mins, and each min, into 60 secs. Many nations and each min, into 60 secs. Many nations could have had almost any position that the President could bestow, the course of the course of the course of the President of the Curope for accustomed to divide their day and night the President. He had interviews with

most of the rulers and leading statesmen of the Old World—a practice followed by President Roosevelt in 1940 and 1941. In 1915 H. again went to Europe to be the eyes and ears of the President, and, particularly, to study the possibility of Wilson acting as mediator between the warring nations. Whon America entered the war in 1817 H. once more went to Furnous as chief 1917, H. once more went to Europe as chief of the mission to study means of fulfilling

before 1700 B.C. Hs., of two or three storeys with stairs to the upper rooms; the ground floor rooms obtained light only through the doors, the upper floors were lit by windows. The rooms were rect-angular, the roofs flat. This is the S. type of H. In Greece, in very early times, the H. was of circular form. It passed through many changes to a rectangular formation in which the circular form is Allied war needs. He then became a member of the Allied War Council, and when the creased in width, central columns were

Powers met at Versailles to draft the Peace Treaty, Wilson named H. as one of the Amer. peace commissioners. As such he took a considerable part in drafting the he took a considerable part in draiting the League of Nations covenant. One of the most fascinating books on Europe and America just before, during and after the war is The Intimate Papers of Colonel House, ed. by Prof. C. Seymour, 1926-28. See A. D. Howden Smith, The Real Colonel House, 1918.

House, term used for a building erected for habitation. It therefore includes dwellings of any size from a single-proper.

dwellings of any size, from a single-room building to a palace. Hs. set the architectural type of the epoch. The early Egyptians lived mostly out of doors, and their dwellings were of wood or crude brick. Their smallest Hs. consisted of single rooms. Their larger Hs. had outer

added. The roofs were pitched. The accommodation consisted of a porch, a accommodation consisted of a porch, a megaron with a hearth, and sometimes a further sleeping chamber. The Hs. in Greece were of the N. type. The later dwellings of the Gks. were plain and unpretentious; the rooms faced inwards and round an internal courtyard, the Hs. were of one story, and the light was admitted through the doorways. They were frequently surrounded on the outer walls by shops. In Rome, the accommo-dation was similar to that of Hs. in Greece, the rooms being round an interior court with a peristyle: light was admitted through the doorways, and the ceilings and roots were of wood. The buildings were one storey in height to withstand earthquake. This type was called domus. There were also insulae, or tenements of and inner courts surrounded by porticoes, sev. floors, similar in plan on each floor, halls, and chambers for the family, guests built of concrete with brick facings. The and servants. The ground plans only rooms were barrel vaulted and the walls remain. At Cnoesus the Crotans built, plastered. The floors were covered with sev. floors, similar in plan on each floor, built of concrete with brick facings. The

mosaic. The rooms were lit by windows. mosaic. The rooms were at by windows. They had staircases to the upper floors from the street, as at SS. Giovanni e Paolo, Rome. There were, jurther, villas as that of Hadren at Tvoli, and palaces as that of Plocletan at Rome. The accommodation was semi-public The Rome built Ha. in England, official but these, being of the 5 type, appear to

have had no influence upon the Eng. H.
Between the Rom, occupation and the
Norman Conquest the buildings in Eng-land were of wood. With few exceptions there was no permanent building until fifty years after the Conquest. The castles of the Conqueror were of wood surounded by earthworks In the twelith century stone superseded wood, and the stone H. probably embodied the same accommodation as its wooden fore runners. The keen was the domestic part of the castle, and the important room of the keep was the hall. The Hs. other than castles were still of wood. The keep was nearly always square, as in the case of the White Tower of the Tower of London, and Rochester Castle (1130) The walls were very thick, the rooms being badly lighted by a small window to each floor. There are two rooms to cach floor in Rochester Castle, and there is a chapel in the thickness of the walls, and a circular staircase communicates with each floor. The windows are small and unglazed; a wall fireplace heats the hell, the smoke being taken through the wall. In some case, the floors of the keep were of wood, in other, stone-vanited. The rooms were on top of each other, baser cut, hall, and attic. The kitchen was detached. Where defence was not the paramount consideration, the rooms were placed side by side upon the ground. The hall was still the prin. apartment of the H. and was used for living, eating and sleeping. This type, the fortified manor H, survived, and developed into the modern H. The and developed into the modern H. The keep type continued in such buildings as the Peel tower of the N and Lattersull (astle, Lincolnshire, and cls where until the mid-lifteenth century. The hall gave the name to the H. At on end of the hall was the kitchen, at the other the solar or master's room. The solar grew into the name of rooms for the family, the letters. -uite of rooms for the family, the kitchen into the domestic suite. In the manor type of H , the hre was in the centre of the ball, nearer the end used by the master of the H., the smoke was let out through louvres in the root. To increase the width of the hill, a row of columns was placed on our side or on both Glass was sometimes used in the windows in the mid thirteenth centur, but not generally until the tifteenth entury. In some cases the strength was detached from the H. Towards the end of the thirteenth century decoration and comfort were considered

Stokesav (astle, in Shropshire, built in 1940, is to-day a well-preserved thirteenth to carry a well-preserved thirteenth control carries and the control carries are put to different uses. In common with sev. other old houses, it was styled a 'castle' because show and stateliness was still further the tops of the walls and towers were realised. Rules of proportion produced

fitted with battlements—in other words, castellated—where as it was really only a fortified manor house. It is considered the finest oxample in England of an early hall. Well preserved S. Castle is defended by most, gatehouse, and tower 14 great hall was built in 1210 and the tower 50 years later, when the owner obtained his

teenes to crenellate, or fortift his home.
Haddon Hall is to day similar m plan
to what it was in the fourteenth contury. to what it was in the fourternth contury. It is grouped round an upper and lower county and the hall divides the two courts. The building is of the tortified type there are few windows; and it is in from the inner courts. The rooms communicate directly with one another, but privacy is assured by the use of screens. There are some rooms on the trist floor over the kitchen. The planning is wasteful. The windows are small. In this, Hs. were built side by side within the walls until the available space was utilized. By the close of the space was utilised. By the close of the fifteenth century, the need for tottifica-tion had passed Elizabethan plans of Ils, were more economical of material and their planning was more convenient. They were designed to produce offects (though there is some evidence of unnecessary towers eather). Towards the end of the sixteenth century the builders considered the symmetry of their electrions. During this century the greatest changes took place. The period concided with the Renaissance, which commenced in this country, in the reign of Henry VIII, with the dissolution of the monasteries, and the transfer of wealth from the Church to the Court. On the clevation the critical to the Court. On the clevation the cornice and pilester appear, and within the plan more privacy is provided by the use of corridors, as at Hengiave Hall, 1648. Tho subjects of Queen I Brabeth yied with each other in building large estabs. H type plan was evolved as letting in more air than the courtyard type. Windows became larger, chimners and fireplaces were more highly developed

In the seventeenth century the design of Hs became personal. The taste for the It tishion was gracified by Imgo Jones, Wien, and, later, Vanbrugh. In the coun-Wren, and, later, Wanbringh. If the country dists the old traditional type of plan and building continued. The design of Ha, now followed two lines. In the academic type, the position and use of the hall were slowly altered from that of a hving-room to that of an entrance. The ground floor was used for the day rooms, the upper floor for the sleeping rooms. The staircase became more central. Such windows were first employed. The chinneys colected into staks, and there were deriver. ierted into staks, and there were dormors as part of the roofs and not, as formerly, as part of the walls. The Cryl war district the development of building. Architecture became fashionable through books on the subject Castle Howard is the culmination of this period. It was built for display, and the outside wings are similar, though the rooms behind them

beautiful Hs. which were highly inconvenient The rooms were too lofty for comfort, though pleasing in appearance The kitchen balanced the stables, but both The Rivenon balance of the stanles, but non-were separated from the H by long colon-nades. There was some protest against this tendency, but usually the dictates of Andrea Palladio t. numphed, and Hs. lost comfort and gained stateliness. Some of the smaller is were more practically built. The in Il was developed on a narrow frontage faring on to squares and streets, repecting the same plan such by an the design of their elevations the such side in blocks and groups. With the mieteenth cutury, the growth of building increased with the pop and their migration from the country to the tar and cities. The people had to be housed their work. Little list in terraces the kitch is scaled to a contract and order in attention and cities.

ated with a ulpture. Baths and gymnasia ue provided in England, the modifica-tion of the building regulations to allow of artificial ventilation of bathrooms will affect the future planning of flats and Hs On the Continent there are Hs, built to start the phrase's machine to live in as the definition of a H. This tendency has hid some influence on recent king planung

ated in sev. Hs. In 1801, Lord Smallesbury called atten tion to the condition of overcrow line no London In some localities there were t more than eighty Hs to the in, with families in cach to in Lagislation wis emacted providing for the eccion of lodging-Hs, subsidied out of the poor rates Other Acts followed They did not produce the desired effect. In 1890 not produce the desired effect. In 1890 the London to Council bean to det with the problem. They built flats, the more recent of which are fixe floors high three floors of flats and the fourth and lifth floors two storey tenements. Con fith floors two storey tenements. Con tinental countries have adopted flats,

partnessing, and enjays es the import unce of structure the buildings are winden framed and derived from Eng ources the small 1 being wooden examples of his cottages in the ighteenth century they because forms being wooden tages in the m plan, based upon the palladish etyle copied and adapted from books by hig writers. This type and period are called toorgan Colonial. The early Republican Il show ir indu nees Oval tooms are found, the communication within the H is carefully studied the bedrooms being criticed through so tate doors. In New York there are IIs of the oughteenth oen tury with Dutch chuacteristics, notably covered verandas. In the S. Sp. types prevail, the walls are thick, the buildings of one storey round open partos and the channeys outside in the N the plan-iro more compact, the chimneys inside the In Stockholm they are sometimes twelve it. With the opening of the nine teenth storeys high in Amsterdam are to eight century, romanticism influenced the destoreys. In Germany and Austria the sign of the American influenced the decords about the blocks of flats are decorded to the decord of the century the ideas found in all these periods

and areas have been exploited and develand areas navo been exploited and averaged oped. In general, modern Amer. H. plans have the living-room and the dining-room connected, the dining-room being reached from the kitchen and living-room only. The dining-room is usually small. only. The dining-room is usually small. The bedrooms are often without fire-places. In many Hs. the living-room contains the only fire-place, the Hs. being heated artificially. There is a tendency to place the living-room at the rear, garage and services towards the street. In New York, apartment Hs. of thirty-one stories, 380 ft. high, have been built. Indeed, with the difficulties of obtaining servants, the building of big modern apartment Hs. has been increased in Amer. cities.

Interior Deviration, General.—Electric lighting has led to considerable experiment in the interior decoration of Hs. Diffused, concealed, reflected, and strip lighting have all been used. Colour has been given to light by tinted glass screens and neon tubing. Walls are sometimes considered as toxture in order to break the even distribution of the light. Glass considered as toxture in order to break the even distribution of the light. Glass is used in ceilings; polished steel for foors. Mural painting has been revived. Colour is used for psychological ends. Glass in various colours and as mirrors is being largely employed. The room and its furnishing are being considered as an entity. Emotional and spectacular effects, rendered possible from the use of colour and form, are being successfully designed. The various rooms are being decorated to accord with the moods appropriate to their use. The walls, ceilings, windows and doors have all been treated with the same colour or shades as tending to homogeneity. The bathroom is being considered—cheerfulness being stimulated by coloured walls and fittings of various material—porcelain, ceramics, mosaic and paint. Glass and stainless steel have been tried as handrails and for various fittings. Built-in fittings are used in mest of the rooms of the H. in order to economiss space and simplify decoration by glung the room of the H. in order to economise space and simplify decoration by giving the room that greater unity which follows from the employment of the architect of the H. as the designer of its furniture. Mouldings have been reduced, and surfaces are less broken. Pictures are selected with greater care-for colour and design-their setting being considered, or designed for them. There is less ornament in Hs. and less provision for their display. Ornaments are selected for emotional effect. The psychologist and the scientist have been studied by the decorator in order to stimulation. studied by the decorator in order to stimulate health and pleasure. Houseboat, riv. boat which is fitted with every convenience for habitation, i.e. has living, sleeping, and cooking apartmonts.

living, sleeping, and cooking apartments. In England these boats are found mainly In England these boats are found manny on the R. Thannes, and are only used as temporary housed by people making riv. excursions; but in the E. countries Hs. which very much resemble floating huts, are common on all the large rivs., and are used as permanent residences; indeed, many of the Chinoso, Burmese, etc., spend their whole lives on those floating craft.

Housebreaking, see under BURGLARY.
Housecraft. Term which includes not
only housewifery (q.v.) and cookery, but
which has wider implications, the scientific practice of H. being known as
'domestic science,' and including the
choice of a house, its furnishing and equipment, cleaning and care, and embracing
such subjects as cookery dietetics laure such subjects as cookery, dietetics, launsuch subjects as cookery, dietetics, laundry work, and home nursing. Teachers' training courses in II. may be taken at the Battersea Polytechnic; Berridge House, Hampetead (now under the National Societies Training College of Domestic Subjects); the National Training College of Domestic Subjects, Buckingham Palace Road, and King's College of Household and Social Science (Univ. of London), Campden Hill. In the provs., and abroad also, many schools and colleges provide full courses, and degrees are awarded in domestic science. Shorter courses of instruction in housecraft are given at various struction in housecraft are given at various polytechnics and schools of Domestic Science. The choice of a site for a house should

be considered in relationship to the soil, aspect, contour of the land, drainage facilities, and provision of water, gas and electricity; the plan of the house should be prepared with full regard to the facilities offered by the site. Choice of furnishings, largely a matter of individual taste, should, novertheless, have regard to a general colour scheme, walls, flor covering, curtains, and style of furniture having a relationship to each other. The kitchen is the workshop of the house and should receive special consideration, as the smooth running of the entire estab-depends largely upon its effolency. Labour-saving devices should be incor-porated as far as possible, not only in the kitchen, but in the other rooms of the house. These may include: built-in cup-boards and wardrobes: rounded corpors house. These may include: bunton cap-boards and wardrobes; rounded corners to facilitate cleaning; washable or tiled walls in kitchens and bathrooms; plain doors to cuphoards and rooms; hot and cold running water in the bedrooms; kitchen cabinets for the storage of dry goods and a hatchway unit between dining-room and kitchen; airing cupboards they pass the winter chiefly in the pupal for linen; stainless steel sink units with draining trays, cuphoards, etc.; stainless Household, Royal. The R. H. probmetal taps; bakelite or plastic electric ably had its origin in the commutatus des metal taps; Dakelite or plastic electric fittings; enamelled gas and electric cooking stoves; electric vacuum cleaners and floor polishers; electric washing and washing-up machines Information and advice on good household equipment can be obtained from The Good Housekeeping be obtained from The Good House keeping Institute, 28-30, Grosyenor Cardens, London, S.W. 1. See E. W. Gregory, The Art and Craft of Home-Making, 1922; E. E. Jardine, Housecraft, 1928; Pauline Griffin, Happy 19 the Bride, 1916, also Blackie's Domestic Science Handbooks including Simple Lessons on Health and Habits, Simple Lessons on Household Management, and The Chemistry of House craft.

House-duty, Inhabited, tax imposed on inhabited dwelling-houses of the annivalue of upwards of £20 in England, Wales and Scotland. Its incidence was on the legal occupier and not on the owner. There were numerous exemptions, such as houses helonging to the royal family, hospitals, alms houses, school buildings trade and business houses, and others. The duty ceased to be chargeable after 1923-24 (Finance vet 1924, Sect 20) House-fly, Flesh-ily, or klu ca domestica, name given to a species of dipterous

tica, name given to a species of dipterous insects belonging to the family Muscidiz.

1 White um Jores THE PROBOSCIS OF A HOUSE LLY

The two jointed probose is is shown, with the palps and the lips (labella) permeated by feeding tubes

These files are widely distributed and very numerous, especially in summer. The eggs are deposited on dung-heaps or similar places, and the larvæ feed on their surroundings until pupation, which takes place in a few days' time; at the end of a fortnight they are fully-developed winged insects. The chief characteristics are the sucking proboscis and the bristle-feathered antenne. Ils. are considered frequently to be agents in the spreading of disease:

Household, Royal. The R. H. probably had its origin in the commutus decribed by Tacitus which consisted of comites or companions who were the personal attendants of the Tentonic chieftain. In England before the Conquest the comites had been replaced by them, the chief of whom were the staller or hurse them and the bounches while or horse thegn and the bowerthegn, while in Normandy a similar arrangement had been estab, and each duke had his senes chal or steward, his chamberlain, and his constable. After the Conquest this ducal constable. After the Conquest this ducal household was reproduced in the R. H. of England The hist. of the R. H., however, is difficult to trace, as very few records concerning it are forthcoming. The Black Book of the Exchequer enumerates its offices in Henry II's reign, but gives no account of their function, and the Collection of Ordinances and Regulations for the Government of the Royal Mouchald made on Invest Proceedings. Household, made in Divers Reigns from I due to the top indeed, give some details about the court nuted, give some details about the court arrangements during the fifteenth and sixteenth centuries, and Chamberlayne's Presul State of England contains a catalogue of the officials at the court of Queen Anne, but no connected hist is forth coming. Be this as it may, the existing R II is essentially the same as that under the Ludges or Plantagencies and consists. the Indors or Plantagenets, and consists of three main depts. : the lord steward's dept (Board of Green Cloth), the lord chamberlain's Dept, and the master of the horse's Dept, which can rerhaus-clim the greatest antiquity. At the head claim the greatest antiquity. At the head of the first is the lord steward, who must always be a member of the gov and a pur and it is interesting to note that he still possesses a criminal jurisdiction such us was originally inherent in every head of a dept , indeed, all juri-diction relating to homicide in respect of the R. H. resides in him, and under his mandate alone can inquests be held or criminals be indicted and tried. Under him are the treasurer, the comptroller, the master of the house hold, the offices of the almonry, and the paymaster of the Household. At the he id of the second is the lord chamberlain, who must also be a member of the gov and a peor, and under him are the vice chamberlain, the master of the Cere-monies, whose duty it is to enforce the observance of the eliquette of the court, observance of the eliquette of the court, the gentleman usher of the Black Rod, the prin usher of the kingdom, the lords and grooms-in-waiting, who attend on the king in turn for all out three weeks at a time, the captain of the Corps of Gentlemen at-Arms, the captain of the king's bodyguard of the Yeomen of the Guard, the countralies and examiner of accounts the comptroller and examiner of accounts, the dean and the sub-dean of the Chapels Royal, the pages, the master of the king's nursic, the poet laureate, the royal physi-cians and surgeon, chaplains, painters, librarian, and musicians.

The Queen Consort's Household is also

in this dept and compuses a lord Cham- | care of the fabric and contents of a house, berlain, a treasurer, equery, and various ladies. These include the mistress of the robes, who attends the queen at all State functions and is the only lady of the Court who comes into office with the got, seven ladies of the bedchamber, who must be peereses seven women of the bedcham ber who appear only at Court functions and eight maids of honour, who as a rule are daughters or granddaughters of peers, and who in any cise have the right to pre ny honourable, to their names even if not entitled to do so by buth. The third dept has at its head the master of the Horse who also is a member of the gov He has charge of all matters connected with the horses and h u ds of the king and under him are the Croy i Figuria who practical v manages the roy i stubles and stud-the officers of the equering who are alway armed forces an I attend the king in turn like the lords and grooms in writing the pages of honour vouths who wait on the king at state eccumones. Besides the three depts mentioned there is its the Privy Purse Dept which cousts of the king's 'persound staff and includes the keeper of the privy purse and the privit-scretary. The civil 1 provides for the maintenance of the P it 114 8000 being granted for solarie and 1172,800 for expenses, besides a unit 1172,800 for expenses besides a monof clib,000 for their majested priva pure \$2,000 for works, \$13,200 for real bounts and \$8000 uneppropriatel

HOUSES OF

Housewifery, term defining activity of the wife in the home, and not confined to adapted to meet indiviousline housework, but embracing the can be considered here

care of the fabric and contents or a nouse, and the skill necessary to convert the house into a home—a happy home and a contented household being an important contribution, at all times, to the national life. The surroundings of a house are important it should, if possible, stand in a productive garden the rooms of the house should be so arranged as to admit the maximum of sum and all to those frequently used. Modern practice is for the quently used Modern practice is for the house to face S II or S W and not due S the kitchen, scullery, and laider should the North Bedrooms (an face \$ \Gamma, or \text{\$\sigma}\$) The ann of the modern house wife should be to attain satisfactory results within a reasonable time and with the minim im imount of physical labour, this can be whieved by acquiring a knowledge or, and using modern labour saving equipment as in as means permit (see also Hotsici (FI)

Good turniture should be regarded as an esecutial, but over furnishing should be there should be ample space in as orde 1 which to work and move about son it requirements vary, but a good rule is to buy only the essentials it possible from a well planned range of unit furni tur whi he can be put together like unit bei helve thus allowing for additional from the may be classified as utility circuilly and well designed and of pleasing projection non-wild traying standards of projection non-wild to the various dear hour greater and more individual. gen ally a good quality as far as material and wikm unship is concerned, but very off it of high for the modern house or rtique- invariably well made, but often un uitable for a modern house and dasaezten ire

Dans (13 anno - A certain amount of cleaning each day is a necessity, though aften, sould not be made at a thorough ansing of the entire house cach is it fictory result can be obtained div in are is a able time, and efforts should be made to attain a happy medium between interf two k and planning in oxh mist hener a more officiently accomplished if the feel wang order is observed bedrooms (bath 'n and levatory if on the first flor), landing, sturs, half, itsing room, kitchen and back premises. In blief, the wisk as from the top of the house down Dilly cleaning eneares that noth ing is overlooked (to become very dirty and thus demand excessive time, materials and ishour on its cleansing) and it gives an and thout on it cleaning and it gives an opportunity of Icoping all polished surface—flors mirrors, windows, etc—tright and duning, and generally to 'tidy up di the rooms Household routine should always be so planned that this daily cleaning is finished before the start of the general work of the day As vary-ing houses present their own problems, and even rooms of the same type demand special requirements, only general prin-ciples of daily cleaning which should be adapted to neet individual requirements

should be aired and the cleaning apparatus ready to hand a heginning should be made by cleaning the fire place and relay-ing the fire if a b droom is being cleaned, re making of the bed should be given first attention followed by the elecating of any fitted hand basin, and literwards the sweeping of the floor (or sweeper or ifterwards the vacuum ele incrover the triget) and sinas vacuum ele incrover the triget) and sinas work ing any small mats. The main work done the turnit ne lels ngs, door and window frames etc may be dusted in full bright surfaces polished with a pelishing and a map rubbed over any surrounds on the floor Lastly, polished surrounds on the floor the room should be gen a ally tidied. When all the household learning is completed the cleaning equipment and materials should be carcially packed away. Beds should be opened by removing all the bedelother and placing them over two chairs arching the mattress so that it may air the mat tress should be turned daily, from side to side and from head to foot alternately the beliter and p flows should be shaken bedelothes should be smooth and crosseless and the sheets tucked tightly under the mattices. Where it is pressible for two people to make the beds the work is halved and made much easier

In clean a pre-pl. The hearth right

In clean a pre plan The hearth rac should first be tolled up and the carpet turned back while the floor in front of the hearth should be covered with newspaper, | and the fender and are irons moved to one ande while the sent from the back of the moved it is advisable to save these cinders to the next fire but the ashes should be completely removed, preferably using for the purpose an old bucket lined with newspaper, which facilitates disposal in the dust bin the fire is laid by lightly crumpling newspaper on top of which dry sticks are placed crosswise, the cinders being placed at the back of the fireplace small pieces of coal at the front and larger pieces at either side limitly, any bright proces at either aid. Limilly, any bright surfaces should be polished, and the tilewashed before the replacement of the fire irons hearth ing and cupet and the refilling of the coal box

Io clean a pttcd hand hann and sur round,—The basin should be half filled with warm water in which the tooth gliss can be washed and then dried the glass shelf and its contents dusted, and the sur round to the bean, and the sorp wells wored. The basin should now be emp tred, rinsed and dried, and the taps rubbed up with a dry duster

Lo clean the laratory and huthroom —It is advisable first to sweep or mop over the floor, when the lavatory should be flushed and a little di-infectant spinkled. The bath should be wired over with a damp cloth, sprinkled with a little paradin, and afterwards rinsed, any stains upon the bath may be removed by subbing seap on the cloth and applying to the stains, while it will be found that unegar will remove any blue stains. (are is advisable in the use of abrasive substances when cleaning the bath, as these may tend to spoil the surface enamel. To complete the work.

all k dge - should be dusted and the window left open while if the weather permits, the towels and bath mats should be dried in the open air

WINKING -1 more thorough cleaning should be given to each part of the house, if possible it we kly intervals the order of work should generally, follow that wisked for daily cleaning, ex-cept that, after cleaning and relaying the in the wills should be swept, paint work on doors window sills and mantel plece cte, should be washed and the functure in I floor p h hed. Dust shocts should a ver furniture during the weekly clauming unless an electric cleaner is being used after use they should be carefully removed folded with the dusty side inside. tilen outside and shaken and packed the clocks should be moved as little as Where there are I ting is in progress bing numbers of books they should be the chee dusted and the whole covered with edust shoet

PRICIAL CIFANINGS TRING AND Si ng leaning should be this beet before il le to do without fires and when the we other permits, furniture bangings, car

t to may be put out into the garden ning and cleaning. The housewife hould plan carefully as much as can be ine call day without disorganising the ends and ensuring that the extra work to a not interfere with the preparation of or her meals in men bers of the family A decision should first be int horself m : le regarding inv necessity de corations and arrangements made for this work to be done, and it may be found that the chimneys require sweeping. Before the cleaning begins, the hou owife should be sure that there is a good supply of cleaning in iterals and that all the equipment is in s ood order, and a beginning may be con con order, and a bigining may be on conjudy cleaning all cupboards, drawers, they, etc., and by cleaning and storing away winter clothes, curtains, extra limbers, ciderdowrs, etc. It this con a ction it will be found that protection ig unst 1 joths is advisable Special work to be done during the spring cleaning in cludes the cleaning and if necessary pelishing of all pictures, ornaments, walls, a untwork, furniture, carpets and bed Plus tu

Order of Spring claning -Work should lern at the top of the house, cleaning in t those rooms which are least used I ndings, passage hall, and staircast in uld be cleaned after the rooms, and the kitchen and back promises last of all I lest to finish one room before beginning the next, and to keep the doors of rooms dready cleaned cloud

Special cleanings -A sick room should in kept scrupulously clean, and the fewer its contents the latter (see NUNSING— Home Nursing) he freplace should inst be cleaned, and the coal-box quietly rofiled. Before sweeping the floor all furniture should be drawn out from the

walls in order to remove any dust that has collected. Damp tea-leaves or sawdust should be sprinkled over the surface before sweeping is begun, as this prevents the dust from rising. If the floor is carpetcovered, a carpet-sweeper should be used daily, and furniture, ledges, dusted with a slightly damp cloth, finishing with a dry cloth. Fresh water should be given daily to flowers in the sick-room, and their removal at night.

Preparation for chimney-sweeping.—The sweep will expect to be told the exact date and time he is to attend, and to be in-formed of the number of chimners which will require his attention. Unless the sweep is using the new vacuum (or a similar) method, by which chimners may be swept without disturbing the room, the following preparations should be made: furniture should be covered with dustsheets or newspapers: curtains and the hearth-rug removed from the room; the carpet should be turned back from the fireplace and the floor covered with newspaper; the floor-space immediately near the fireplace should be well covered to allow the sweep space on which to rest his tools; the windows and door should be kept shut while sweeping is in progress. HOUSEHOLD CLEANING EQUIPMENT.—

Brooms and brushes, whether made from horse-hair, fibre, bass, bristle, or one of the various substitutes, should be washed when necessary, (a) soft brushes in warm soapy water, rinsed in clean warm water and dried in the open air; (b) stiff brushes in cold salt water, allowing 2 tablespoonfuls of salt to a bucket of water, rinsed in cold salted water. Care should be taken not to lean on a brush or allow the bristles to bend or break, and to remove all dust and fluff, after use, by shaking. Brooms and brushes should be hung up in a cupboard when not in use. Carpet sweepers operate by means of a revolving brush between two dustpans. These dustpans should be emptied daily, and all pieces of fluff, cotton, etc., may then be removed; it is possible for the entire instrument to be possible for the entire instrument to so cleaned by the housewife herself, and this may be done occasionally by unscrewing the bandle, removing the furniture guard, and taking out the revolving bush. The component parts may then be thoroughly cleaned and reassembled. Electric cleaners are an important part of the where electricity is cheap. The best-known types are the outside bag type, also known as the broom-handle type, such as the Hoover, etc., and the enclosed bag type, such as the Electrolux, etc. Kneeling mats are made from a variety

of different materials, and can be bought or improvised from a pad of old soft material. Step ladders long enough to allow the housewife to reach easily up to the top of cuphoards, etc., are extremely useful. There are many kinds, but the safety-ladder type should always be bought. Rack for brooms and brushes are

KITCHEN EQUIPMENT AND CLEANING. Glass cooking utenglis should be steeped in cold water if they have been used for milky or floury foods, and in hot water if used for greasy foods. They should be washed with hot soapy water, sode being added if the dishes are very greasy, and if very dirty they may be scoured with stool wool, a saucepan brush, or scourer, after-wards being rinsed and dried with a net cloth. Saucepans should be cleaned according to the surface material -- they may be obtained in various materials ranging from aluminum to enamel. Only the outsides and lids of saucepans should be polished, the pans being tilled with water immediately after use, hot water being used to remove groasy food and cold water to remove milky or floury foods. Saucepans should be cleaned as soon after use as possible, dried thoroughly, and kept uppossible, dried thoroughly, and kept upside down in an airy place. Enamel ware should be washed with warm soapy water, a fine cleaning powder being used it necessary, after which the articles should be rinsed and thoroughly dried. Care should be taken to avoid knocking the surface of chamel-ware articles, as this causes the enamel to crack, agreeing the causes the enamel to crack, exposing the foundation metal, which rusts on exposure to morture and air. Earthenware casscroles should be steeped in hot water if greasy, or in cold water if milky; they should then be washed in hot soapy water, using a sacepan brush, or scourer, and the outside may be cleaned with a fine clean-ing powder. The use of soda should be avoided, as this is apt to remove the glaze from the inner lining.

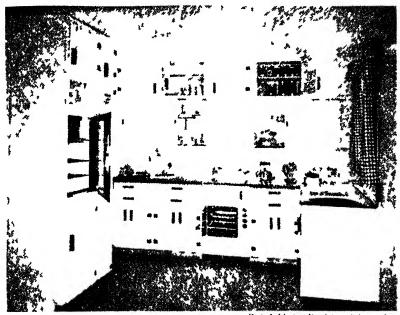

Baking and roasting tine should be steeped in hot soapy soda water, afterwards being washed in a further solution of hot soapy soda water. Stains may be removed by the use of a cleaning powder, after which the tins should be rinsed and after which the tins should be rinsed and dried in a warin place. Cake tins should be rubbed over whilst still warm with absorbent paper, but washing should be avoided unless this becomes absolutely necessary, when the tins may be treated as for baking and roasting tins. Frying pans should first be emptied by pouring the remaining fat into a small lar and reserving the future use after which the pan serving for future use, after which the pan should be whold with clean absorbent paper; washing with soap and water should be avoided, as this spoils the sur-face and tends to make food stick to the pan. Mincing machines after use should be taken apart so that all food may be removed with a fork, scraping if necessary, and afterwards washed in hot spapy water. After rinsing and drying with a net cloth the drying process may be advantageously completed by placing the minorr in a cool oven or on the plate rack.

China jugs or howls which have contained milky or floury foods should be rinsed with cold water, then filled with cold water and stood aside to soak; any pieces should be scraped off platos, which should then be washed in hot soapy water, extremely useful as they enable brooms, using a cotton mop; it is advisable to brushes, and other cleaning equipment bogin washing the cleanest things, fluishto be tidly stored. They can either be ing with the greasy china. After rinsing bought or improvised from odd materials.

Asphalt coment and concrete should be Aspirate towards and thrush and priod sauly swilled, after sweeping with cold water, the water being brushed towards the drain with an old stiff brush. Stone should be swept daily with a soft brush and if much used the first should be scrubbed with hot soda water after sweep

in the plate rack, with the exception of a soft brush and rubbed with a polishing cups, etc., which should be towel dried mop or two dusters, polish should not be FLOORS AND I LOOR COVERINGS— applied however, beneath carpets or rugs the wood or linoleum should be period ically washed with warm soap water, dried with a flooreloth after which pollsh may be applied (ork lineleum should be cleaned rach day as for polished wood Periodic ally the lineleum should be washed with warm scally wat r, but should not be scrubbed

Carpets and rugs should be cleaned

After rinsing the doors and windows open to create a and drying it should be polished with draught. Matting requires cleaning daily furniture polish or cream. in the open air, or left to dry indoors with the doors and windows open to create a draught. Matting requires cleaning daily by sweeping, and may periodically be gently scrubbed with cold saited water on both sides, afterwards being rinsed and

dried in the open air.

dried in the open air.

WALL COVERINGS may be enamel, paint, tiles, wallpaper, or distemper. Thes may be cleaned with warm soapy water: wallpaper may be cleaned by removing the surface dust with a brush covered with a clean cloth, or with the vacuum cleaner, and especially dirty marks can be removed by the careful use of india rubber; varnushed or washable surfaces should be cleaned by removing the surface cost and washing the most soiled parts with tepid water and borax, allowing I tablespoonful of borax to one quart of water; distemper, or choir wash,

quart of water; distemper, or colour wish, may be cleaned with warm soapy water.
Wood.—A number of different woods may be used in a house in the flooring. furniture, fixtures, and donestic appli-ances. Wooden surfaces may be left be left smooth and plain, as is the case with pastry smooth and plain, as is the ease with pastry and draining boards, or they may be covered with some protective coating, such as paint, enamel, or stain, which may afterwards be varuished. Plain wooden surfaces are easily cleaned by scrubbing with hot soapy water, care being taken to scrub with the grain to avoid roughening the wood: the wood may be ening the wood; the wood may be carefully scraped with the grain, using carefully scraped with the grain, using an old knife, if particles adhere after scrub-bing; rinse in cold water, which helps to keep the wood a good colour, dry with a net cloth and finish drying in the open air if possible. Stains such as those made by if possible. Stains such as those made by meat, vegetables, parsley, etc., may be scrubbed off with plain cold water, or, if obdurate, they may be sprinkled with kitchen salt and then scrubbed; oil and grease usually yield to hot soapy water. Protected wooden surfaces should be dusted daily and rubbed hard with the duster to maintain the polish and occasionally washed with warm soapy water, using a soft nail brush for carved surfaces. Polished or varuished surfaces should be finished with furniture cream or polish. Paint on woodwork exposed to the outer air should not be washed with soapy water, as this tends to blister the paint, use being made instead of a mixture of parattin and water, allowing I tablespoonful of para-fin to half a bucket of warm water.

mn to had a ducket of warm water.

Fure-truer.—All furniture should be dusted or brushed daily, loose covers being straightened and well tucked in and cushions puffed up. Cane furniture may be cleaned by washing and rinsing with cold sait water, allowing, I tablespoonful dealt to tweeter or trater and drainst horse of salt to I quart of water, and drying thor-oughly in the open air. Wicker furniture should be washed with warm soapy water, using a soft cloth, and if very dirty a soft mail brush may be used. After riusing and drying the furniture may be polished with a liquid furniture polish. Drving in front of the fire should be avoided, as this causes the funture to creak. Leather and imitation leather cloth may be periodically

GLASS.—Flower glasses and bowls should be washed with warm soapy water. and howls using a soft nail brush if necessary; stains may be removed by placing a tablespoon-ful of salt in each ful of salt in each vase, covering with vine-gar and water, and allowing line vase to soak overnight, then washing in the usual way. Windows and mirrors should first be dusted, then rubbed with a pad of lightly-crushed newspaper, or tissue paper. Periodically the paint-work of the window trame should be cleaned, and then the window. Methylated spirit, or one of the commercial window-leaning liquids may be used instead of water to clean windowand mirrors. It is unwise to wash windows in frosty weather, or while the sun is shining directly on the window.

Mitals.—A number of metals are usually used in the ordinary house. Aluminium, chromium plate, cleetroplate, galvanised iron, lead, monel metal, pewter, stainless steel, ctc. Steel knives, tin and zinc, can be washed with hot soapy water, using a soft cloth, stains being removed by the use of a little fine cleaning powder. Steel wool can be used for removing stains from aluminium and pewter, and powdered bathbrick for re-moving stains from galvanised fron. Chromium plate, monel metal and stainless steel may be polished by rubbing with a dry duster; aluminium and tin by rub-bing with dry whiting and polishing with a duster; electroplate and silver by rubbing with whiting or polishing with a commercial plate preparation; galvanised iron, lead and zinc by rubbing with powdered bath-brick and paratiln, finishing with a dry duster; pewter as for solid silver; steel by rubbing thoroughly with dry steel wool or emerypaper and finishing

with a soft dry cloth.

BEDS AND BEDDING .-- Bedsteads should be made as plainly and simply as possible to allow for easy cleaning; a bedstead condits of a head board and a footboard. held upright by means of iron side bars, on which rests the wire mattress and the The design upholstered mattress. modern bedsteads is changing and the head and footboards are becoming lower and smaller; in some cases the footboard is omitted altogether. If both head and footboards are omitted, the bed then becomes a divan bed. Mattresses consist of wire links of different shapes, mounted in a metal frame; the upholstered mattress is soft and warm and covers the wire mattress; there are several types of filling for upholstered mattressed—horsohair, wool, flock, fibro, etc. There are also sev. varieties of mattress such as the spring mattress, which, as its name suggests, con-tains springs in addition to the filling; the box mattress, containing spiral springs and filling, etc. A wire mattress, unless made of stainless metal, should always be covered to prevent rust and stains being transferred to the upholstered mattress -covers can be made from clean sacking, hessian, or any piece of thick cotton

Pillous -The standard size is 20 in by 30 in and this should be remembered when buying pillow cases. The filling may be of buying pillow cases down or feathers, and the outer covering is made from a cotton meterial known as pillow ticking, a finer variety of mattress ticking. Bolsters are always filled with feathers and the outer covering is the same as for pillows

HOUSE HOLD LINE -In every house a special place should be set apart for the sife keeping of the household linen IΙι lmen cupboard should be dry and airy but not hot, as heat is hable to cause the linen to take on a yellow tinge. Linen should not be stored if it has been starched the shelves of the linen cupboard should be covered with clean white paper of with material such as old sheeting. A written li t (inventory) should be kept of all the line and it this is kept up to date it will assist the narranging replacements it will assist the natinging reperiories household linen or he marked by using marking into or by the use of woren names. Is use of the heavy initial cost of household here in the cost attached by the perfect condition for aslong as possible. The intended done by external manders, when two old to serve its capital in fiding reason is in receive and arcful using. When too old to serve its ough a purpose and inciding a no longer possible it should be cut lower and used. for other purpos

MINOR ELECTRICAL FAULTS.—One of cluded in that environment the home the commonest electrical faults in the fitself. II. legislation up to 1890 was more or less ineffective. Then came the Act the switch is turned on. The bulb should of 1890, which was passed after the report first be tried in another socket to ascertain whether it is worn out or still operating; if the fault is not that of the bulb, the lampholder may need adjustment; or the flex at the plug and ceiling may be faulty. Fuses can be tested by switching on lights in the same circuit; if these are working the fault lies between the fuse box and the lamp; care should be taken to switch off all current before inspecting any electrical equipment—flex, lamp-holder, etc. It a fuse has blown, switch off at the main, pull out the fuse holders in turn from their flying clips until one carrying an incomplete (melted) wire, or only ends, is found. A dark stain caused by the combustion will probably be noted. The terminals of the holder should then be unscrewed to release the ends, and a length of new fuse wire inserted loosely connecting the two ends. It is important that fuse wire of the correct thickness be used. A supply of tuse wire both for lighting and power circuits should always be kept at hand.

Electric bells .-Common faults in battery-operated bell avstema usually arise from the batteries themselves. Leclanché type or wet cells consisting of a zinc element and a porous pot immersed in a solution of sal-ammoniae, should have the level of the liquid, if low, replenished with a solution consisting of toze, sal-ammoniae to 2 pints of clean water. Zincs which are nearly eaten through should be replaced. Replace dry cell batteries from time to time before they are quite worn out. (See also ELECTRIC BELLS AND ALARMS.)

Williams Home

Housewifery, 1948; J. G. Williams, Home Loundering, 1949. Housing. Less than fifty years ago the Housing. Less than fitty years ago the Statute Book contained no legislative enactment (beyond one or two ineffective Acts to enable local authorities to acquire labourers' lodging houses or artisans' dwellings) even purporting to deal at all comprehensively with the H. problem. That problem is the consequence of the in-That problem is the consequence of the intense industrialisation of England consequent on the development of machinery. Practically all the great manufacturing this, each with its squalid alleys and, slums, sprang up in the course of the last century. The Factory Acts (see Factory LEGISLATION) interfered with a one-sided freedom of contract by imposing on the employer the necessity of making the environment of factory workers less devices. vironment of factory workers less danger-ous and less insanitary. The H. of the Working Classes Acts, the first of which under that title was passed in 1890, in-

or less ineffective. Then came the Act of 1890, which was passed after the report of the Royal Commission on the H. of the Working Classes of 1884, to consolidate the Artisans' and Labourers' Dwelling Improvements Acts, 1875 to 1885, and other Acts. Compared with its predecessors, this Act was an ambitious piece of legislation, and many of its provisions for dealing with unlicatility areas and houses until for human habitation were reneated. unfit for human habitation were repeated in the consolidating Act of 1925. Burns's H. and Tn. Planning Act, 1909, was also an ambitious piece of legislation, and sought to improve the health of the people by raising the character of the house and home, and by extended inspection, super-vision, and direction of central control to help local authorities to do more than they could at this time. The Act of 1890, together with the Acts of 1903, 1909, and amending Acts up to 1909, contained powers sufficiently wide to enable effective action to be taken by local authorities who were prepared to act in spite of inherent difficulties. The consolidating legislation resulted in two chief measures from which local authorities derive their powers. These two Acts were the II. Act of 1925 and the Tn. Planning Act of the same year (as to the latter see under Town Planning). An Act passed in 1930 made further provision with respect to the clearance or improvement of unhealthy areas, and, in 1935, legislation was passed to prevent overcrowding. Practically the whole of the provisions of the H. Acts of 1927, 1930, and 1935 were repealed and re-enacted, with slight modifications,

in the codifying H. Act of 1936.
After the end of the war, Dr. Addison, as the first minister of health in the son, as the installment in augurated a new scheme under the H. (Additional Powers) Act, 1919 (to provide dwellings for returning soldiers—'homes for horoes'). The country was divided into eleven arous under H. Commissioners, and local authorities were encouraged to follow the lead. In brief, the scheme turned on an undertaking by the Exchequer to make good loses incurred under the Act, the authorities being responsible to the extent of a penny rate. As a result 214,000 houses were erected suitable for occupation by the working classes. Unfortunately an indirect result of the scheme was the rapid rise in costs, which moved in the case of a single three-bedroomed house from 6643 in 1917 to £888 in 1920, while London Co. Council houses at Rechampton rose to £1,750! Dr. Addison was suc-ceeded by Sir Alfred Mond (later, Lord Melchett), and in the same year the Geddos ancientt), and in the same year the treates Economy Committee pussed severe stric-ture upon the inaucial aspect of the scheme, and by Oct. 1922 the price had fallen to £346. The number of houses built under the Addison Scheme was 88,000 in 1921, 108,000 in 1922, 28,000 in 1923. Private building without State aid was increasing, however, reaching 58,000 was increasing, however, reaching 53,000 houses during the same year, and it appeared that soon local authorities might

became influster of health, and during the became initiator of iteatin, and during the vear his H Act was namportant Act in that it stabilised the logal position of II, gathering the errant threads from as far back as 1890, while the Tn Planuing Act did the same service for in planning—the in planning Part of for in planning—the in planning Part of Burns's Act, 1909, involved a material advance in the relations between the owners of land and the local authorities but the provisions of the Bill in its original form work greatly modified in the committee stage of its progress thice oninfitte stage of its progress. If the principles are insisted upon by the Acts (1) the power to compel local authorities to act. (2) the right of an owner to be informed of the proposals of the local authorities and to appeal to the Ministry of Health, and (3) the right of the owner to the content of the content of the owner to the content of the owner of the content of the owner owner to the content of the owner of the owner owner of the owner owner owner of the owner ow to compensation in certain cases where he is injuriously affected Part II of the li Act of 192) authorises the local authority to carry out Improvement Schemes for

dealing with unhealthy areas
This provision is repeated in the H
Act of 1930, is to improvement schemes already undertaken, but that Act makes no provise n for fut a improvement schemes, and would appear so concentrate on the more drastic plan of charance schemes, which involve demolition of all the buildings within the scheduled area (see infni). The Ministry may require the local authority to provide suitable ecommodation for persons of the working classes who may be displaced by the scheme. As to houses unfit for human habitation, the local authority must cause their dist to be inspected, and there is also a duty imposed on the medical officer of health to act on his own initiative, and if approached by local gov electors, he must inspect the premises complained of Tho and report to the local authority next step is for the authority to make a closing order (statutory machiner, which was borrowed from Burns s Act of 1909) prohibiting the use of the house or houses in question until they are fit for habita tion—The owners must be notified, and may appeal to the Unistry of Health Reasonable removal expenses must be paid to tenants who have to full the confedenced bouse or houses. If the owner falls to make the house it for habitation within a specified period the local author ity must then consider the issue of a demolition order (these orders were also provided for in the 190; Act), and the owner has the right to be heard on it. The authority in ty make or postpone the order for six months, and the Ministry of Health may, on application by the owner rescand the order if good cause be shown If, however, the order becomes operative, the owner must take the house down within owner must take the horse down within three months, falling which the local authority may do so, sell the materials and pay the owner any balance after payment of expenses. Certain back to back 'houses erected after 1909, and also

proceed with programmed independent of gov help.

With the return of the Conservative Party, Mr. Neville Chamberlain again was the Act of 1903 which prohibited the crection of back to back houses, that is houses constructed without any space in the rear or any windows except in the front walls, so that there is no possibility of any through ventilation from front to but where there are no by-laws ICHT requiring open space in the front as well as in the lear, the crection is not prohibited of houses one room in depth with no bulyard and no rear wall windows, provided they do not back on to similar houses. Part III of the Act of 1925 working classes kyery local authority must con ider the needs of its area, and, as often is occasion arises, or within three months after notice given by the Ministry of Health, prepare and submit to the Ministry a scheme specifying (1) the approximate number and nature of the houses to be provided, (2) the average number of houses to the ac, (3) the quantity and locality of the land to be acquired for the purpose, and (4) the time within which the scheme or part of it is to be carried into effect. The Ministry may be carried into effect approve the scheme with or without modi two or more local authorities are affected, a joint scheme may be prepared. The Ministry of Realth may enforce the exer cis by the local authority of the statutory powers under Part III or authorise the committee that the committee that the committee the committee that th vision is also made for loans ou mortgage from the local authority to persons con-struct ng or altering houses, but such a ivances are subject to a limit as to the siz of the house or houses under con-struction. Power is also given to local co councils to promote the formation of public utility society w by making limited grants or loans for housing. The number of houses built with State assistance between 1919 and 1)_J was 721,000, with mit such assistance 351,000 and, of retter _74,000 were of not more than rateable value, or the inteable value in Metropolitan police dist bince the t World War and up to 1930, the total o r of payments from the Exchequer sut ally in respect of housing amounted to \$65,00,000 Up to 1936, more than \$60,000 new hours had been built in the United Kingdom so far as slum cherince was concerned direndy, by that year 400,000 shim dwellers had been provided with new and better accommo at ion under the troy's slum clearance presimme

The Act of 1930 (the so called 'Slum (h nance' Act) me to further provision with respect to the charance or improve ment of unhealthy weas, the repair or demolition of insar tray houses and H. of the working classes. It also amended all the previous Acts relating to H. subsidies Where local authorities doclars an area to rooms habitually used as sleeping places, be an improvement area, due provision must be made for persons distlaced, whether through demolition abstracent of over crowding etc., and similarly where areas are scheduled as tearance areas which in effect me us demolition Increased powers were given to local authorities to enforce notices to upair or demolish insanitars houses but an appeal lay to the co court. Where premises were demolished the co court had power to determine the lease. The re-enacting clauses of the Act of 1936, walker or properties the restance of t make no more than indirect reference to improvement schemes and it is to be pre-sumed that the appropriate remedias now only by charance schemes except where improvement schemes were initiated before the A t of 1936 came into operation A clearance scheme applies to an area in which the house iely reason of disrepair or sanitary detects un fit for habitution of by icason of their bad arrangement of the n flowness or bad arrangement of the streets dangerous or injurious to the health of the inhibi tants and in which the other buildings if any in the ire are for a like reason dangerous or injurious to he dth where the most satisfactory method of dealing with the conditions in the area is dealing with the Criticities in the area is the demolition of all the buildings in the area. But the local authority is bound first to provide suitable alternitive accommodation for the previous of the working classes who are displaced by the clearance The usual conditions as to In any case the scheme mut be within the local authority a resource A clear any case the scheme must be whenhe the local authority a resource. I clear ance order requires confirmation by the Minister. The owner or owners of the property involved must denote the with a weeks from the late a which the order requires the laddings to be vacated, and if the local athority under their demolitors that the owner does take demolition they too must do so within that period

A survey was undertaken by Muistry of Health in 136 into the incl dence of overcrowding and over 1 00 local authorities co operated in it llie result showed that of a teral of \$ 924 23 dwellings inspected, 341 4 (3 %) (recut) were overrowded, and that the survey also showed that the very very light of working class dwellers up 1 hard well working class dwellers in I list divide above the overcowdin to I id (see 13/12) except that the 14 n no lation at the disposal of large families of eight units' or more has on the whole in sufficient like average to the different classes of local authorities was I on I n bors 7.0 mm hors 1.2 nou con hors and inh 2 non co bors and urb rural dista 2 J The per co bors, 1 2 dist- 30 ru centage in London varied from 17 2 (Shored tch) to 1 7 (Woolwich) in cobors from 20 8 (Sunderland to 0 3 (Bournemonth) and in geographical co-from 12 of Durham) to 0.7 (Isle of Wight) 01 873,03 compell house inspected, 44,888 or 1 per cent were found to be overcrowde 1—as compared with a per-centage of 1 4 per cent for privately owned dwellings

enacted in the codifying Act of 1936), spon-ored by Mr King-ley Wood, introduced new measures for the abatement of overcrowding and the fixing of a national standard of accommodation (% heddle I)
There is a statutory definition of over
crowding, though the ministri of health
and the local authority may in creating
crounstances, relax the standard

The overcrowding standard may be re fixed by the minister only where a large projection of the housing a commodation in the area is constituted by dwelling houses consisting of tex rooms or rooms of exceptional floor are and then only aft a consultation with the Central Adv. 13 Committee (see infra) The Adverse Committee (see infra). The lead is a louthority may also relax the stand is 1 by it ence but only ewing to the exister cost exceptional encuritaires in hiding sees and increases of pape a gradier of visitors at haliday times. In any excut there is a time in it on relaxing to the budget of a complex are made responsible for overeasy lings and the sees at a track of the sees with the there are statutory defines available eg n alt mative accommodation was offered and refused. The steps to be taken by the local authority with regard to overcrowding are by way of inspection and report followed by pro o als for an accommodation and the dates when the sters have to be completed are fixed by the minister. If the result of the inspec-tion is such is to call for a redecelopment s heme the le il authority will beve to as a resolute n to that effect and within trunths preper to development plin t i submission so the mini ter

I submission to the min ter in result to the code from Act of 10 6 provid that it the led authority for any urb area are strived that their thick distributions and that their distributions are acontaining 30 or more wirking less houses that it less one than an exercise when the modern and according to the containing of the containing containing of the the industrial and social conditions of the dit a e such that the area should be used te a substantial extent for H the working classes and that it is exp dient in cen nect in with the provision of H accomme dation for the working class a that the area is hid he is developed as a whole it I the r duty to pass a resolution declaring the area are development area and pro ceel a cordingly

I a sist the minister and local authori in II there is statutory provision for the entitution of a Central H. Advisory C nille to adv toth the minister at 1 th virus II Minager of Commissions are of a terriament character and exercise such of to local authority a functions as to the the repair and maintenance of working class hou es and other buildings or land previded in connection with such houses, as I av be d legated to them by the local authority with the approval of the Provision is also made for the minister ene tragement and protection of H 1950x rations--voluntary bodies which are evidently 'public utility societies' under a new name these associations are The H Act, 1935 (repealed but re- entitled to the same amount of subsidy

1925.

A demolition order may now be made in respect of 'obstructive buildings, which, although in themselves not unfit for habi tation, would detract from the benefit of the measures taken for the improvement of H. conditions A building, to: this purpose, will be 'obstructive' if it is, by reason only of its contact or proximity to other buildings, dangerous or injurious to health. An offer may be made to the local authority by the owner for the sale of his interest and for assessment of compensation and the local authority is bound to accept the offer if made in the terms prescribed by statute if no offer be made the owner must demolish within specified period or the local authority will enter and demolish, and sell the materials in the usual way

An exchequer subsidy will be paid in respect of blocks of flats of not less than three storeys built on expensive sites Local authoratics will be called on to contribute sums equal to half the amounts of the I schedur payments. The idea im-pliest in the Act of 1935 is that private building enterprise should house the classes

with the help of subsidies.

Powers are conferred on local authori ties compulsorily to acquire properties for reconditioning at market valuation to arrange with property owners or public utility corporations to carry out te-

condition na

As regar is the compensation provisions of the Hact, 1935, provided that it dwellin houses or other buildings were no longer to be included in slum cle trance tre is and compulsorily acquired at site value reduction factor reducing compensation otherwise payable to owners or property jounted for tell purposes was abolished by the same Act The Act also provided that a distinction should be made in fayour of landlords who had endeavoured to maintain slum property in habit tole condition, and special compensation pa d to | them on the basis of the amounts expend ed on repairs in the y years preceding **co**ndemnation

Concurrently with the question of the supply of new houses there arese as a result of the Pirst World War, an econo mic problem concerning the rents of pre-war houses. Owing to the demand ex-ceeding the supply it was foresten that property owners would seek to profit unduly at the expense of their tenants To prevent threatened hardship the Rent Restrictions Act of 1915 was passed, and no increase in rent beyond that of 1914 of small houses was permitted until 1919, when, owing to the greatly increased cost of repairs, some advance in rent- became necessary. Perhaps profiteering was most itagrant in the case of furnished house, and these were included in a further Act in 1920 Increases of rates, however were passed on to the tenant. In 192, an

as the local authority itself would have that houses which became empty after been entitled to under the Act of 1923 ceased to be controlled. (See Rani IN VIRICTION ACTA)

While, then, the primary need for new houses claimed the greater prominence in the gov's attention to ii. in the years immediately following the First World War slum clearance received most attention in the field of legislation after 1930 10 to 126 sch mer resulted in the demoil tion of 11, 72 houses. This number was only a very small proportion of those need-mer a molition, indeed, it is a question wit that number was not equalled by the gross hold it fresh slum areas, through the contraction of the second of the s overcrowding and neglect of repairs, augustavated by demolition. The method of rell the poor in tenement dwellings, will the heast popular according to the lindings of he Chamberlan Committee on I nhealthy Areas, appeared to be the only a much ate alternative in congested 1 Pt 1 built in area, is they are called The difficulties of space and the workers tray Ping to work offer no ready solution. I ut in tural are as it is possible to develop H homes side by side with the planning ided. By the Act of 1919 every urb. author ty of 29,000 mhabs was competed to offer schemes for the approval who can pay common cents while the of the ministry of health. An important local authorities are to house the needlest, put of the schemes was the div. of the n w c as acto zones, for industrial c in croad, shopping, residential, and ju he use By 1926 nearly 500 schemes hid near cvolved some 800 000 persons w to removed from alutis into new houses diffuse the first five years' programme for sum h rance (1955) and during that ferral 165 134 house were demolished on e that year the plun was extended to thin cover 130,000 shim dwellings. Leeds, ment a city notorious for shims, then had and a most advanced schemes for H. The Dictential renting was introduced in 100 over 130,000 slum dwellings 11 The needs were to be housed in addince with the size of their families, the standard of their paying capacity, and to their 1 comes

It is a cynnal comment irv on the great procession of H. Acts—with their total inn burden of 1 000 000 accrued by mes-that the tar bomb has done men to eliminate six as than all the legislit ii When the air raids began in 1940 overcrowding in shelters and on tube won national standard of accommodation of 1935 a mockery Fortunately largese de evacuation from London prevented serous congestion in the Metropolis despite considerable destruction of H, as ommodation, five where bombing had been concentrated on a particular ar s, and workers had had to move away from their work the great net-work of Lindon's transport -ervices was instrumental in obviating any enduring diffihappy combination of circumstances did not obtain in many of the chief prov. cities, which had suffered heavy bombardment. There, evacuation had been on a much smaller scale, and the des-Act which continued till 1927 provided truction of living accommodation raised

an soute H. problem. Furthermore, over-crowding and social distress were only the beginning of the nation's difficulties in this matter. Some industrial this wore boon being threatened with a situation in which it was not physically possible to house workers within reasonable distance of their work. This problem was beyond the control of the local authorities, and its solution required compulsory billeting over a wide area, coupled with the general requisitioning of all available large or empty houses and halls. It called also for the immediate construction of new accommodation in the form of huts. hostels, and temporary houses and a still more vigorous evacuation policy. It became obvious that rehousing was not simply a post-war problem; in some areas it was a problem which, on a temporary basis at least, required prompt solution in order that neither public morale nor production might suffer

Housing after the Second World War. A greater H problem than that imposed on the country by the First World War was that which followed the Second Millions of houses were destroyed or more or less seriously damaged in the an raids; moreover the programme of house-build ing during the war years was a very limited one, as was that I the immediately antecedent period. After hostilities had ended Britain entered upon an era of the most acute economic crisis when the shortage of both labour and, still more, of materials made it impossible for some materials made it impossible for some time to carry out even a small part of the planned H. programmo. Far more new permanent houses were planned and actually statted in 1946 than could po-sibly have been timished within a reason solid time. Up to the end of that year some 170,000 families were found accommodation by the reput or refashioning of existing dwollings, as against 150,000 families rehoused by the construction of new dwellings. The most fruitful form of new construction was the temporary housing scheme which yielded 92,000 new homes (pre-fabricated houses). The three types of permanent house con struction-provision by local authorities. provision by private builders and other private agencies, and the rebuilding of war-destroyed dwelling—together produced no more than \$5,000 dwellings. Of

able in all dists, tremendous pressure was applied to get house building started in all districts, in order to prevent any drift of labour out of the building industry. But later, and before the close of 1946, it bot inter, and below the close of 1329, became easier to enlarge the number of workers than to enlarge the supply of materials needed to keep them fully occupied, and in Dec. 1946 the industry's total labour face 1,20,000 was practically equal to what it had been in 1939 (June) for 1947 H, work of all kinds was allotted three-fifths of all building labour. Work on existing houses (maintenance, ropairs, conversions, (tc.) was to be allowed to absorb 280,000 operatives, while 300,000 were to build new permanent houses. With this labour force, and with a stock of 204,000 unfinished dwellings left over from 1946 (Including 974) per cent of the muni-cipal houses started in 1946), the aim for 1947 was: the starting of 240,000 new per-manent dwellings, of which 201,000 would be carried forward for completion in 1945, and the completion of 240,000, including the 204,000 brought forward from 1946. The houses to be computed included The houses to be completed included 190,000 municipal dwellings, 15,000 war destroyed houses and 35,000 to be built by private enterprise and other agencies some 60,000 bungalows wanted to wind up the temporary H scheme were also included in the 1917 programme. The first white paper on post-war H. (dated March 1945) set out three objectives. The first was to give every family a separate home and, to do this, it was estimated that 7:0,000 dwellings would be needed. The second was to continue the slum-clearance schemes suspended during the war; it is commated that another 500,000 houses would be needed to replace unit houses and to relieve overcrowding already con-demned before 1939 The third or longdemned before 1939 The third or long-term objective was defined as 'a continnous programme of improvement in housing conditions, bringing old houses up to date, converting others into flats, and building new houses where necessary to meet changes in the location of industry. No figure was assumed for this but the minister of health, much later, said that they had to 'envisage a programme of something like 4,000,000 to 0,000,000 houses, and even then we should have some arears still left. Though the target of 7:0.000 houses above mentioned was duced no more than 55,000 dwellings. Of 750,000 nones above mentioned was these, 21,000 were numerically evided in the number proved hopelessly each of nonely all for sale) privately owned. During the war scarcity of end of the war and mil 1949, the number building labour was generally expected to be the main obstacle to a rapid (x-pansion of house construction As demobilised building workers become available to objective of 750,000 additional provided in the same of the provided in the same of the same o

SOME EXAMPLES OF ENGLISH HOUSING

1. Arrey type houses of non-traditional construction in the New Forest, him the matthem, parlour scullery, three bedrooms, bathroom and W C., wash house, fuel store and second W C in out

building 1947.

2. Traditional brick houses in Barrington Road, Worthing (architect, C. Cowles Voysey, F. R. I.B.A. iving-toom, kitchen, three bedrooms, bathroom, set arate W.C., and outbuilding containing fue and tool stores. 1947. C.O.I. Crown copinght

3. Aluminium prefabricated houses at Cheltenham, two bedrooms. Hambiev.

4. Flats at Hildrop Estate, Islington. 207 flats in 4 blocks—2 one-room, 33 two-room; 81 four-room; 10 five room, completed in 1948. London Counts Council.

tional houses, which the Coalition Gov. had estimated at the end of the war to be necessary to provide a separate home for each family in need of one. In mid-1949, 190,48d permanent houses were under construction in Great Britain, and an additional 63,847 more were approved but not begun. The mouthly figure of permanent houses put into occupation over the preceding year exceeded 15,000, and the yearly total increased steadily in the period 1945-48. Moreover, there was a gov. programme for the building of 15,000 aluminium bungalows, allocated to mining areas to relieve a particular need. For rural dists. Sir Edwin Airoy designed a two-storey house of concrete blocks and posts, and 2 :000 of these were allocated. The need for moreased production of coal and tool led the rest of the rest to the second se and food led the gov. to give priority to the housing needs of workers in mines and on the land; from April 1947 to June 1949 30,328 new permanent or temporary houses built by local authorities were let to miners, and from April 1945 to June 1949 18,418 to agric, workers. The different form the first to the different party of the state of the stat culty of softwood timber imports was a limiting factor; supplies from Europe and Russia contracted sharply in comparison with pre-war years, and N. Amer, imports were a charge on dollar resources. By the end of June 1919, 912,700 families had been housed: 681,043 in permanent or temporary new houses: 139,887 by the repair of houses rendered uninhabitable by bombing; 115,770 by the adapta-tion and conversion of existing dwellings. When the use of service camps and temporary huts, and requisitioning is taken into account, 999,710 families were housed Some three and a quarter million people had, in sum, been provided with homes. Repairs were also effected to 775,000 damaged but habitable houses.

More and better houses have been built in Great Britain than after the First World War, though perhaps fewer than in 1938 when there were fewer men to build them. Houses today however are one-fifth larger than before 1939 and there are more fittings, points and gadgets This may partly account for their taking longer to build today. It has been calculated that if the housing situation re quires a programmie of four to two million houses at the pre-1939 rate of building it would take from thirteen to sixteen years to complete; and at the present (1919) rate it might take seventeen to twenty As regards construction, some experta think there is not sufficient experi-mentation with non-traditional methods; others, however, think that brick is always to be preferred. Experience has shown that the 'pre-fab' house takes as long to build, besides costing as much, if not more. A committee of inquiry into cost recently reported that a typical local authority house of 1947 cost 31 times as much as it's pre war counterpart and re-quired double the labour and a third more material. In London the average cost was authorities; the preservation of houses £343 in 1939, including the cost of land, which have special historic or architecreads and sewers; in 1949 the comparable tural interest; an increase of Exchaquer average figure was £1815—threefold more, subsidies and contributions from the Rents, however, are not three times more.

The rents ordinarily payable by the persons of the working classes are mostly controlled rents under the Rent Restriction Acts, pegged at 1914 rents plus 40 per cent in the case of old-controlled houses, or at 1939 rents for others. To enable local authorities to keep the rents of new houses down to a reasonable level, the subsidy was raised to £16 10s, a year for 60 years from the State, and to £5 10s. from the local rates or £22 per house in all. This subsidy, it was estimated, would enable the rent to be fixed at 10s. a week. But though building costs had risen since 1946 the subsidy remained the same, and to meet the higher interest charges on the higher capital cost, local authorities had to increase the rent, or make larger contributions from the rates, or both. Private builders were (1949) building for owner-occupiers one-fifth of the total number of houses allocated ; in addition, the greater proportion of local authority houses were being creeted by private builders, working under contract for the local authority. In Jone 1919 the meximum price of privately-built houses was made variable according to the type and size of house, and was to be assessed by the local authority according to the cost of similar houses built by them, instead of boing tied to the previous limit of £1,300 (21,100 m London). Also the maximum superfired area of such houses was raised from 1,000 sq. ft. to 1,500 sq. ft. Under the Housing Act of 1949, which

applies to England and Wales, improvements carried out by the local authority must onsure satisfactory accommodation for at least thirty years, and the work must conform to standards of amenity and titness specified by the udmster. Exchequer grants towards the cost will equal three-quarters of the estimated ann. less to the local authority, the remaining quarter to be met from local rates. Local authorities will pay grants for the approved schemes of private owners, to the maximum of one-half; an Exchequer contribution will be given to the local controllion will be given to the local authority. From most sections of the thorsing Acts the term "working classes" is deleted, thus enabling local authorities to create balanced communities by the provision of mixed estates of houses of varying type and size. Local authorities are empowered to provide restaurant and laundry services and to sell furniture. Allowances for persons displaced from sites acquired for housing are permitted. Control of selling price and ronts of new premises provided by building or conver-sion is extended from Dec. 1949 to Dec. 1953. The £1,500 limit on house-value for which councils may loan money for purchase under the 1936 Housing Act or the Small Dwellings (Acquisition) Acts is raised to £5,000. Other provisions include special subsidies for residential nectude special sucedars for residential hostels provided by housing associations, new tn. development corporations, or local authorities; the preservation of houses which have special historic or architec-tural interest; an increase of Exchequer subsidies and contributions from the raised by measures (e.g. building in stone) taken to preserve the character of the surroundings, such measures to be approved by the minister; and the quashing of demolition orders, operative before Jan. 1, 1946, where houses have been made fit for babitation, as has happened in a small number of cases. The extra subsidies payable for houses and flats built on expensive sites will be adjusted for schemes approved by the minister after Feb. 1949, in order to take into account

Feb. 1949, In order to take into account variations in density of development. See W. Casson and A. Ridgway, Housing and Town Planning Act of 1999, 1912; H. E. Smith, Municipal and Local Government Law, 1920; B. S. Townroe, A Handbook of Housing, 1924; F. Fremantle, Housing and the Natura, 1926; T. Housman, Alfred Edward (1859-1936), Eng. Lotfinist and poet. Educated in Worcestershire at Bromsgrove School; St. John's College, Oxford. Higher-divelerk in H. M. Pater' Office, 1882-92. Prof. of Lat., Univ. College, London, 1892-1911. Fellow of Trinty College, and prof. of Lat., Cambridge, 1911. Pub. poetry is A Shropshire Lad (1896), Last Poems (1922). Ed. Manilius—Ik. I, 1903; Book II, 1912; Book III, 1916; Book IV, 1920; Book V, 1930; Juvenal (1905), Lucan (1926), More Poems was pub. posthumously in 1936. There have been muny reprints of A Shropshire Lad which is a string of sixty-three ballad-like which is a string of sixty-three ballad-like poems (they have been set to music)love, country-life, drinking, and fighting. H.'s poetic craftsman-hip is remarkably perfect in one who could give comparatively little time to verse. His total out-put is small, but in his work there is hardly a weak line. He has the secret of or the decorative ornamental. In regard to the content of his poetry, he has been compared to Hardy, but the likeness as uperficial, for his philosophic outlook is that of the unregenerate finalist, desparational descriptions. ing but resolute in his acceptance of man's hopeless struggle. Sec L. Housman, Some poems, letters and a personal memor, 1937; and G. Richards, Housman, 1939.

Housman, Laurence, Eng. author and illustrator, b. 1865; brother of Alfred Edward H. Studied art at S. Keusington.

Moon (1904), John of Jingalo (1912), The Royal Runaway (sequel to procedling, 1911), Turn Again Tules (1930). His novels are: An Englishroman's Love-Letters (1900), A Modern Antawa (1901), Subrina Warhama (1904), Trimblerigg (1921), Ungle Tom Pudd (1927), H.R.H. the Duke of Flamborough (1928). Playinclude: Prinella (with H. Granville-Barker, 1911), The Death of Orpheus (1921) Possession (1921), Little Plays of St. Francis (1922). He has also written Arthur Royal Houghton (1896), Dethronements (inaginary dialogues, 1922), Echo de Paris (about Oscar Wilde, 1923), Palace Plays (1931), The Queen's Progress (1932), The Unexpected Years (1931), Palace Scenes (1937), Collected Poems (1938), Garvous Majesty (1941), Samuel, The Kingmuker (1944). Moon (1904), John of Jingalo (1912), The Kungnusker (1944).

Hovey, Richard (1864-1900), Amer. poet, b. at Normal, III.; graduated at Dartmouth, and followed various professions in succession; came to Europe and trans. poems of Maeterlinek. Wrote much original verse, including Launcelot and Guinevere, a scries of dramas. Talierin, and thinevere, a scries of dramas, Tattern, 1 Masque, and Seavard, pub. together in a posthumous collection. The Holy Graal (1907). Collaborated with Bliss Carman (q.r.) in Songs from Vagahondia (1893 and 1896), and pub. miscellaneous poems, Along the Trul (1898).

Howard, illustrious Eng. family, dukes of Norfolk since the fifteenth century, at

of Norfolk since the ifficenth century, at the head of the nobility, perhaps descended from the Hereward of Edgar's reign (957-75). The first noted member of the house was Sir William H., or Haward, chief justice of the Common Pleas under Edward I. and Edward II. (1297-1308). His grandson, Sir John, was admiral and captain of Edward III's navy in the N., and sheriff of Norfolk. The admiral's great-grandson, Sir John, was a prominent Yorkist, created first duke of Norfolk and earl-marshal of England (1433). He fell at Bosworth Field (183). He fell at Bosworth Field (183) fighting for Richard III. His son, Thomas, earl of Surrey, was imprisoned for three years, but then regained his rights and titles, commanding the Eng. at Flodden (1513). His son, Thomas, third duke of Norfolk, was attainted by Henry VIII., and only escaped a death similar to that of his son, received a state of the state o came earl of Arundel and Surrey (1601), and earl marshal (1621). Bernard Edward H. (duke of Norfolk, 1815), was great-grandfather of the sixteenth duke, Bernard Marmaduke bit-Alan H. (b. 1908).

The numerous branches of the family of H. are represented by the dukedoms or earldoms of Carlisle, Suifolk, Berkshire,

age of England, 1779; M. Tierney, History of Arandel, 1834; H. Howard of Corby, Memorials of the Howard Family, 1834; H. K. Causton, The Howard Papers, 1863; C. T. Gatty, The Noble Family of Howard, 1879; G. Brenan and E. Statham, The House of Howard, 1907.

Howard, Catherine (c. 1520-12), grand-daughter of the second duke of Norfolk (d. 1524); brought up by his widow, she became fifth wife of Henry VIII. soon after the divorce of Anne of Cloves (1540). This marriage pleased the Rom. Catholle party, but Catherine was soon accused of im-morality with Culpeper and Dereham. She protested that she had been faithful She protested that she had been faithful to the king sloce her marriage, but was beheaded with all the partners of her intrigues, including Lady Rochfort (1542), See J. Froude, History of England, iv., 1858; Agnes Strickland, Lives of the Queens of England, lii., 1877.
Howard, Charles, second Lord Howard of Effingham (1536-1624), Eug. admiral, grandson of the second duke of Norfolk. He held yarpuis civil and military nouts

He held various civil and military posts under Elizabeth, becoming lord high admiral (1980). As commander-in-chief against the Sp. of the Armada (1588), ho had Drake as his second-in-command. H. was associated with Essox (1596) in the successful expedition against Cadiz. and made earl of Nottingham in reward for his services. When fresh Sp. inva-sions were feared, between 1597 and 1599, Nottingham was appointed lord-lieu-tenant of England. He continued to hold Nottingnam was appointed ford-figu-tenant of kugland. He continued to hold high office under James I. See J. Camp-bell, Lares of British Admirals and Emi-nent Seamen, 1., 1779. Howard, Sir Ebenezer, Eng. urbanist (1850-1924); b. at London. Hegan work as a clerk in various stockbrokers' offices in the city. Emperated to Nelseeke

in the city. Emigrated to Nebraska where he farmed for a short time, but moved to Chicago and took up the calling of shorthand writer. Returned to Eng-land in 1876 where we worked at short-hand writing in the Law Courts and else-where. The Garden City founded by A. T. Stewart on Long Island and now a suburb of New York probably first aroused by Interest in the advances. his interest in th. planning. H. married in 1879, and at the Zetetical Society, a debating club, first met G. B. Shaw and Sidney Wobb.

Possibly suggested by Henry George's Progress and Poverty, H.'s scheme for a garden city based on land values created garden city based on land values created by the community was embodled in his book Tomorron: A Peaceful Path to Real Reform (1891, rovised 1992) which ex-pounded his theory of rent-rates. H. did not advocate the nationalisation of land but its ownership by nunicipal authorities who would derive the whole of their revenue from rents or leases, thus ensuring that development value of land or earldons of Carlisle, Suffolk, Berkshire, ensuring that development value of land Northamnton, Arundel, Wicklow, Norwich, Effingham, and the baronies of Bindon, Howard de Walden, Howard of Castle Rising, Howard of Effingham, and Howard of Glossop. See Sir W. Dugdale, Baronage of England, 1675-76; C. knighted 1921, Became O.B.E. 1921, Baronage of England, 1675-76; C. knighted 1927. Died at Welwyn Garden City, where he is commemorated by a Howard Family, 1769; A. Collins, Peerlife by D. Macfadyen, 1933; and C. B. Purdom, The Building of Satellite Towns, 1925, 1949.

REY, EARL OF.

Howard, John (1726-90), Eng. philanthropist, capecially famous for his labours to secure prison reforms. While attempting to go to the relief of the survivors of the Lisbon carthquake (1755), he was captured by the Fr., but soon managed to effect an exchange for himself and his fellow-prisoners. II, became high shoriff of Bedfordshire (1773), and in this capacity had his interest in the condition of acity had his interest in the condition of prisoners roused. He travelled widely, visiting gools throughout England and Europe. His State of Prisons in England Europe. His State of Prisons in England and Walts, with an Account of some Foreign Prisons . . . (1777), resulted in the adoption of the hard-labour system. An Appendix was added in 1780. His Account of the Principal Lazarettus in Europe appeared in 1789. He died of camp-fever at Dophinovka, now Stepanovka pear Kleron in Pussia. See lives camp-fever at Dophinovka, now Stepanovka, near Kherson in Russia. See lives by J. Aikin, 1792; J. Baldwin Brown, 1818; T. Taylor, 1836; W. Dixon, 1849; J. Field, 1850; J. Stoughton, (new ed.) 1881; E. H. C. (nl. >>, 1921; also Ancedotes of J. Houard by a tentleman, 1790, and J. Field, Correspondence of J. Houard, 1855; A. R. Gardner, The Place of John Howard in Penal Reform, 1920. There now exists a H. League for Penal Reform with offices in London to promote the right treatment of delinquents and the right treatment of delinquents and the prevention of crime.

Howard, Leslie, stage name of Leslie Stainer (1893 1943), Eng. actor, b. in London: educated at Dulwich College. On leaving school he worked as a clerk in a bank until the outbreak of war in 1911 when he served in the army until his di-charge in 1917. He then decided to fulfil an early ambition to become an actor. He joined a touring company and actor. He joined a touring company and his first appearance was as Jerry in I'eg o' My Heart in 1917. He appeared on the London stage the following year, playing in Mr. Pun passes by, Our Mr Mepplewhite, and other plays. He spent the next few years in New York, and returned to London in 1925, appearing at the Queen's Theatre in The Way Fou Londat II. During a second visit to New York in 1927 he produced Her Cariboard Lover, in which he made one of his greatest stage. in which he made one of his greatest stage successes. He brought the play to the Lyric Theatre, London, the following year. Other notable performances were in Berkeley Square (1929) and This Side Idolatry (1933), in which he played the part of Wm. Shakespeare. He was himself the author of a play produced in New York as Murray Hill in 1927 and in London as Tell me the Truth in 1928. From 1930 onwards he played a number From 1930 onwards he played a number of leading parts in films, including Of Human Bondage, The Petrified Forest, The Scarlet Pimpernel, and its modern counterpart Pimpernel Smith, and Pygmalian. During the Second World War hadden and proposed the second world war he did valuable work as a 'voice of Britain'

in his broadcasts to overseas listeners. In 1943 he went to Madrid to lecture on behalf of the Brit. Council. He was killed on the return journey when the aeroplane

on the return journey when the aeropiane in which he was travelling was brought down by enemy aircraft (June 1, 1943).

Howden, par. and mrkt. 'n. of E. Riding Yorkshire, England, on the Ouse, 3 m. N.N.E. of Goole. It has a thirteenth-century church and a famous horse fair. Coal is mined. Pop. 11,900.

Howitt, William (1792-1879), Eng. author. He began to write at an early ago, and when he was thirteen, one of his poems appeared in the Monthly Magazine. In 1821 he married Mary Botham, and husband and wife wrote many books in collaboration. He early studied natural science and modern literature and languscience and modern interature and languages, becoming a very miscellaneous and prolife writer and very popular. The Rook of the Seasons, or the Calendar of Noture (1831), a Popular History of Prestraft (1834), Partilla, or "indicence of the Most Ancient Times (1835), and the Rural Life of Fagland (1838), give some idea of his scope illis most successful work was a scope. His most successful work was a Popular History of England (1856-62). The literary work of H. and his wife covered poetry, fetton, history, transla-tions, and social and economic subjects: useful and pleasing in its day, little of it has survived. Mary Howitt's autobiography was ed by her daughter in 1989.

Howitzer, name applied to a particular pleas of oxylumpa, which is at the control of the control

piece of ordinance which is of the greatest value in sieges. The word is derived from a Bohemian word meaning a catapult This particular form of gun has been in fairly general use since the systemth century. It is a small, light gan which fires a shell at a small velocity but at a atech angle of descent. It has therefore proved invaluable as a means of hombarding trenches and sourching low-lying and hidden defences. The First World War occasioned a great development in Hs., and the employment of large pieces by the Gers. during the siege of Liege marked a definite advance in construction. The fortifications constructed before the war were no match for the huge weight of projectile used on them, so that when trench-warfare set in, and it was necessary to construct shelters for personnel, gun emplacements and protection of any kind within range, all former specifications of such works required considerable modification to meet the new weapon. though the ders, had this start of the Allies, the latter took prompt measures to nullify the disadvantage, and in the course of time heavier and heavier Hs. Ames, the latter took prompt measures to nullify the disadvantage, and in the course of time heavier and heavior Hs.

Hoyle, Edmund (1672-1769), writer on what and other games. Of his early life appeared in the zone of operations, until nothing is definitely known, but he is supposed to have read for the law. He the 15-in. ('Granny'), appeared in 1915. lived in London, giving instruction in and Hs. were generally employed against forti-

and fications, dumps, guns and for cutting wire 908), entanglements. If their work had been durk done too well they disturbed the surface of the earth so much that it was often difficult for the slide which employed them to traverse the ground to carry out the intentions of the commander. Transport and the removal of casualties were hampered a good deal in this manner The conditions of static warfare favoured the employment of huge IIs., but their transport and ammunition supply precluded their employment in war of movement

Howling Monkeys, name given to the species of Myceles, a genus of mammals belonging to the order Primates and the family Cebide. They are hideous in appearance, having a prominent face and decrease. deep jaw, while the tail is long and pre-hensile. The howling is produced by the unusually developed sacular directicula of the laryns. These monkeys are common to Central and S. America.

Howrah, tn. of W. Bengal, India, on the R. Hugli, opposite Calcutta, of which it forms a suburb. It is a rallway termi

it forms a supurb. It is a railway terminus, and has dockyards and manufs, of pite and cotton. Pop. 379,200.

Howth, th., situated on a rocky penin sult (363 ft. high) of the same name, N side of Dublin Bay, Eire. It is on important is-ling depot and a summer resert. There are runs of an abbey of the thirteenth century. Pop. 3000.

resort. There are runs of an above of the thirteenth century. Pop. 3000.

Hoxter th. on the Weser, in West phalia, Germany, 37 m. N.E. of Pader born Here are Remassance tunber buildings. Near by at Correy is the famous enstellated Henedictine abbev suppressed in 1803. Pop. 7800.

Hoxton (the Hochester of the Domessias Roal) dist of Landon, metropolitan.

day Book), dist. of London, metropolitan bor of Shoreditch, 2 m N.E. of St Paris. In the Elizabethan era it was a pleasure resort. Cabinet-making and upholstery are carried on Pop. 16,686

Hoy (Scandinavian Hoey, high is.), one of the Orkney Is., Scotland, I m. S. of stronness, and separated from the mainand by the Sound of H. Area 53 sq. m., length 13 m., breadth 3 furlongs to 6 m. It uses abruptly from the sea and has magnificent cliff scenery. The cutef heights are Brachrough Head (1140 ft.), W. and Hill (156 ft.), and Cullage Hill (1120 ft.). The 'Old Man of Hoy' is a datached acondaton and 150 ft. bight. Inc.

of 11.20 ft.). The 'Old Man of Hoy' is a detached sandstone rock, 150 ft. high, I m from Roray Hond. There is a good harbour at Longhope. Pop. 1000.

Hoylake, in, and eccles, par. on the Wiral Peninsula, Cheshiro, 8 m. W. of Liverpool, England. There is fine seabathing, and golf, and many Liverpool business men live here. Pop. with W. Kirby 27,700.

Hoyland Nether in in W. Blding, Vol.

Hoyland Nether, in in W. Riding, Yorkshue, England, Al m. S.E. of Barnsley. There are coal mines, rolling mills, brick

works. Pop. 15,200

Byron have alluded to him. His books include: Short Treatise on Whist (1742), Rackyammon (1743), Piquet (1744), Quadrille (1745), and Chess (1761).

Hradec Krālovė (Ger. Königgratz), tn. of Bohomia, Czechoslovakia, on the Elbe, 65 m. E.N.E. of Prague. It is famous for its lattle in 1866 in which the Prussians were battle in 1866, in which the Prussians were victorious over the Austrians: this was known as the Battle of Sadowa. Pop.

known as the Battle of Sadowa. Pop. 52,300.
Hrdlidka, Alek (1869-1943), Amer. anthropologist, b. at Humpolee, Bohemia. M.D., New York Eelectic College, 1892; New York Homcopathic College, 1892; Studied insanity, New York. Accompanied anthropological expeditions, 1893-1913, into all quarters of the world. Assistant curster of physical anthropology, U.S.A. National Museum, 1903-10; and later curator. Member, National Academy of Sciences, U.S.A. and of Czech Academy of Sciences and Arts. Huxley Medal, 1937. Wrote Ancient Man in South America (1912), Recent Discoveries attributed to Early Man in America (1918). The Anthropology of Florida (1922), The attributed to Early Man in America (1918), The Anthropology of Florida (1922), The Old Americans (1925). Also Practical Anthropometry (1920). Skeletal Remains of Early Man (1930), Man from the Farthest Past, 1930. Hroswiths, Hrotsuit (c. 935-c. 1000), Ger. poetess and chronicler. Little is known of her life but she appears to have been

of her life, but she appears to have been a

of her life, but sho appears to have been a Benedictine nun of Gandersheim, near Gottingen, entering the nunnery previous to 959. Here she studied the Scriptures and the classics. Her works, written in Lat. have considerable morit, but great coarseness. They include Lat. legendary poems, six prose Terentian comedies for the entertainment of the sisterhood, of which Callimachus, written in praise of chustity, is the best, and a poetical panegyrical chronicle of Otto I. Her works were ed. by Konrad Celtos at Nuremberg in 1501, by H. Schwizfielsch at Wittenberg in 1501, by H. Schwizfielsch at Wittenberg in 1717, and by Barrack at Nuremberg in 1858. Eng. trans. of the piays were pub. by C. St. John in 1923; H. J. W. Tillyard, 1923. See W. M. Hudson, English Historical, 1888; J. Schreiderhan, Roswithu, 1912; M. G. Wiegand, Nondrumatte Works of Hroswitha, 1936.

Hrozny, Friederich, Czech orientalist;

dramatic Works of Hrosvitha, 1936.
Hrózny, Friederich, Czech orientalist; b. 1879, at Lysá. Has devoted attention chiefly to inscriptions in Hittite language, which he assigns to the Indo-Germanic branch. Pubs. include Die Sprache der Heihiter (1917), Hethitische Keilerhryttetet aus Bophazköi (1919), etc.; Über die Völker und Sprachen des aller Chatti-Landes (1920), Code hittite (transcription and Fr. trans., 1922).
Hsianfu, or Singanfu, cap. of Shensi, China, on the r. b. of the Weiho, 75 m. above its confinence with the Yeilow R. (Hwangho). During the Civil war it was besieged in 1926.

Hsiang, riv. of China, trib. of the Yang-

Hsiang, riv. of China, trib. of the Yang-tsekiang, in Hunan; very important as connecting Kwangtung with Central China. Its W. branch is connected by canal with the Kweikiang in Kwangsi.

Hsiangtau, important dist. and tn. of Hunan China, where produce for Canton (300 m. to the N.) and coal for the Yangtsekiang are trans-shipped. The Hsiang

tsekiang are trans-shipped. The Hslang R. is navigable for junks up to this tn. Pop. upwards of 600,000.

Hslpaw, see Thira.w.

Hslan T'ung, last emperor of China; b. 1905 or 1906. His original name was Pu-yi; he was nephew to Kwang-su, ninth emperor of the Manchu dynasty. His father was Tsai-Fong (Prince Ch'un); and he was selected Nov. 13, 1908, by the Empress-Downger Tzu-Hsl, who d. Nov. 15, immediately after Kwang-sü. Prince (L'un was made regent. The revolution that began Oct. 1911, ended Fcb. 12, 1912, in the estab. of a republic. H. Trotained his title, received a handsome retained his title, received a handsome allowance, and was allowed to remain in the Summer Palace of Peking. In July 1917 he was replaced as ruling Emperor for a few days through the instrumentality for a few days through the instrumentality of Gen. Chang Hsun. He married in 1922. When the Kuomintang obtained possession of Peking in Nov. 1924, they abolished his title and remaining privileges, and he went to reside under Japprotoction at Tientsin. He had cut of his queue, and called himself Henry Pu-yi. In 1934 he was proclaimed emperor of Manchukuo by the Jap. See Pu-yi. In 1934 he was proclaimed emperor of Manchukuo by the Jap. Huallaga, riv. of Peru, rising in the
Andea, ahout 10° 40° S. It flows generally northward for some 700 m, and joins the Amazon (Marafion) about lat. 5° S., 73° W.

Huambisas, race of S. Amer. half-breeds, belonging to the Jivaroan stock, and dwelling on the borders of Peru and Ecuador on the Upper Santiago and Marañon-Amazon rivs. The Sp. blood in them, shown by their light complexions dates from the sack of Sevilla del Oro in 1599, when 7000 Sp. women were carried off.

Huancavelica, or Guancabelica: (1) opt of Peru. Area 8297 sq. m. The dept of Peru. Area 8297 sq. m. The surface is mountainous and mineral wealth abundant. Pop. 244,500. (2) Cap. of dept. of same name, and of a prov of Peru in the Andes, 150 m. S.E. of Lima.

dept. of same name, and it a prov of Peru in the Andes, 150 m. S.E. of Lima. The chief industry is the mining and smelting of gold, silver, and mercury. Elevation 11,850 ft. Pop. 12,000.

Huangho, see Yellow River. Huangho, see Yellow River. Huangho, see Yellow River. Huangho, see Yellow River. Traversed by the Cordillora Oriental, and watered by the R. Huallags. There is much mineral wealth. Coffee is grown in the dist. Area 15,426 sq. m. Pop. 231,000. (2) Cap. of the above dept., Peru, on R. Huallaga, 170 m. N.E. of Lima. It stands in a lovely and fertile valley. A bishop's see. Pop. 20,000.

Huaraz, cap. of Ancash depts, Peru, on the R. Huaraz, 185 m. N.W. of Lima. Elevation 10,000 ft. Pop. 20,000.

Huasco, or Guasco, scapert tn. in the prov. of Atacama, Chile, at the mouth of the Huasco R. It is the centre of a fine fruit-growing dist, is noted for the grapes and raishns and has considerable coasting treads.

and ruisins and has considerable coasting trade. It is a port for mining products. Pop. about 4000.

Huata, Maori weapon, see under MAORIS. Hubbard, Elbert Green (1856-1915), Amer. writer and printer, b. at Bloom-ington, Illinois, U.S.A. Began his Bohendan' career as a salesman and then wrote a few poor novels. Met Wm. Morris and tried to emulate his ideas on Morris and trad to eminate his decas of printing, decoration and medieval design, producing at E. Aurora, New York, a shoddy initation of the Kelmscott Pr.ss, which he named 'Royeroft,' after the Eng. printer of that name. From this which no named Roycrott, after the Eng. printer of that name. From this beginning he founded, and wrote the material for, an 'in-pirational' monthly magazine, The Philistine (1805-1915), which be used to express his bonnely, often a polytical property of the printer of the pr shrewd, platitudinous philosophy. similar magazine, The Fra (1908-17)— title which he had conferred on himselftitle which he had conferred on hinself—never achieved the great popularity of the earlier pub. In 1894 he wrote A Little Journey to the Home of George Ellot, the first of his monthly sketches, chiefly blographical, issued in 14 vols. covering 15 years and numbering 170 booklets in all. His chief work, however, is his A Message to Torcia (1899)—an essay by which the Cuban lawyer and revolutionary, Calixto Garcia (1836 98), became widely known in the U.S.A. This he followed by Loyalty in Business (1921). By the close of his life his 3 veroft Corporation had greatly developed become a large etab., from which he pub. besides his own books works, many artistic books, hand-illuminated and hand-bound. Nec A. Lano, Elbert Hubbard and His Vork, 1901; and F. Shay, Elbert Hubbard of East Aurora, 1926.

Huber, Johann Nepomuk (1830-79), Ger. theologian and philosophical writer, b. in Munich, where he ultimately became univ. prof. He was leader of the Old Catholics and a bold opponent of the Ultramontanes. His works, Die Philosophie der Kirchenruter (1859), and Der Jeanitorden (1873), were placed upon the Index Expurgatorius. He collaborated with J. Dollinger in writing the celebrated Der Papist und dus Konzil von Janus (1869). See E. Zirngiebl, Johannes Huber, 1881. Huber, Johann Nepomuk (1830-79),

1881.

1881.

Huberman, Bronislaw (1882-1947),
Polish violinist of Jewish origin, b. near
Warsaw. Studied as a child under
Joachim, who advanced his interests. In
1894, after sev. public appearances in
European caps., he played in London.
Made a strong impression on Brahms in
Vienna in 1895. Thereafter his life was
that of a famous virtueso. The creution
of the Palestine Symphony Orchestra
was due to his infilative and was innanced
by him. D. at Vevey.

was due to his inhibitive and was manifed by him. D. at Vevey.

Hubert, Saint (656-727), patron saint of hunters (Day, Nov. 3). Hunting on Good Friday, although a holy day, he saw a cross growing out of the torchead of a stag. This he took as a sign from Heaven, heavens a mank and founded an abber. became bishop of Licgo (Maestricht).

Hubli, tn. in the dist. and 15 m. S.E. of Dharlwar, Bombay, India, has important cotton manufs. and considerable trade. Pop. 90,000.

Hübner, Joseph Alexander, Count (1811–92), Austrian diplomat and author, b. in Vienna. His real name was Hafenbredl, which he afterwards changed to H. In March 1819 he went on a special mission to be the state of the country of the Paris and, later in the same year, was ap-pointed ambas, to France. To his influpointed ambas, to France. cuce was largely due the friendly attitude of Austria to the Allies in the Crimean war. But he was taken by surprise by Napolcon III.'s intervention on behalf of It. unity, of which the first public intima-tion was given by the Fr. emperor's cold reception of H. (1859). He did not return to Pars after the war but in 1865 became ambas, at Rome, which post he left in ambas, at Rome, which post he left in 1867. Ho then toured the world recording his observations in Ein Spaziergung um die Well (1872). His other works are Sixtus V. (1872), Purch das britische Reich, 1853-84 (1886), Ein Jahr meines Lebens, 1848-49 (1891). His works, which are very interesting, show considerable insight into their subjects—whether of litted intrigues of the period or whether of litted intrigues of the period or whether political intrigues of the period, or

whether political intrigues of the period, or Brit. colonial questions or the political ideals of Metternich and Schwarzenberg. Ste Sir E. Satow, An Austrian Diplomatist in the 'Fifties, 1908.

Huo, Evariste-Régis (1813-60), Rom. Catholic missionary, b. at Toulouse, educated by the Lazarista in Faris. In 1839 he was ordained and joined the Lazarist Mission to China at Si-Wang. In 1844 he and Loseph (leich his follow Lazari-t Mission to China at Si-Wang. In 1811 ho and Joseph Uabet, his fellow Lazarist (accompanied by a young Tibetan neoph; to who had embraced Christianity), were sent into Tibet to determine the extent of the new apostolic vicariate of Mongolia. They apent some time in a Lama monastery, learning the language, and in 1846 reached Lhasa after much danger and difficulty. They were, however, expelled and forced to return to China. H. returned to France in 1852 and pub. sev. books on his journey, the most famous being Souvenrs d'un Voyage dans la Tartarie, le Thiebet, et la Chine most tamous being souventrs a un voyage dans la Tartarie, le Thibet, et la Chine pendant les années, 144-46 (2 vols, 1850; Eng. trans. by W. Havlitt, 1871, abbrev. by M. Jones, 1859)—a book which contains passages of so remarkable a character as to excite incredulity; but later research to extree incredinity; but later research seems to have confirmed all that H. wrote. Its supplement, L'Empre Chinois (2 vols., 1854, Eug. trans. 1859), was crowned by the Academy. Le Christianisme en thine (4 vols., 1857-58), is an elaborate historical work. All his works are written historical work. All his works are written in a racy and lucid style which contributed to their unusual degree of popularity. See Princo Henry of Orleans, Le Perè Huc et ses critiques, 1893.

ses critiques, 1893.

Huch, Ricarda (1961-1917), Ger, anthores; b. in Brunswick. Educated at Zurich; took Ph.D. degree, 1891. In 1897, Secretary to State Library Zarich. Married, 1907. Richard Huch, doctor of laws. Pub. vols. of pootry; but most of her work is tales, novels, and hists. or novel-hists.; e.g.: Aus der Triumphyase (1901), Vita Somnium Breve (1902), also Geschichte von Garibaldi (1906-07), Das Risoryimento (1908), Der grosse Krieg in Deutschland (1914), Der Fall Deruga (1917), Im allen Reich (1927-34),

of the R. Coine and R. Holme, 16 m. S.W. of Leeds and 190 m. from London. It is served by rail and by canals. The surrounding dist. 14 rich in coal and fron. H. is situated on the great escarpment of the Lower Coal Measures between two entirely contrasting types of scenery—with farming and mining vils. on the E. and S.E. and, on the W. and S. untamed moors and mosses, mostly uninhabited and rising to a height of 2000 ft. From the tn. itself the prin eminence seen is Castle Hill (900 ft.), crowned by a tower erected to commemorate Queen Victoria's erected to commemorate queen victoria's diamond jubilee. The summit is the site of an anct. Brit, encampment and is scheduled as a National Monument, Stretching over a considerable area the bor, has the advantage of avoiding congestion. Most of the residential areas are within a mile or two from the tin., e.g. the garden suburb of Fartown and Sheepridge, the suburb of Birkby, Fixby, and the semi-rural dists. of Crosland Manor and Almondbury. Among the chief buildings are the par. church of St. Peter, the third on the same site. The first was church was built in 1836. It is in the Gothic style, the tower has ten bells and the windows are ornate with vacred scenes and emblems, notably those by Ward. There are about a score of other Estab. Churches in the tn. and immediate neigh-Churches in the th. and immediate neighbourhood and numerous Nonconformist places of worship. The Tn. Hall and Municipal Offices are virtually one large bandsome block. The Hall (which cost £57,000) is in neo-classical style and beautifully decorated. Ravensknowle Hall (with grounds), Dalton, presented to the tn, in 1919 by Legh Tolson for a museum and park, was built in 1860 by museum and park, was built in 1860 by John Beaumont of Dalton. Attached to the Tolson Memorial Museum is a meteorothe Tolson Memorial Musculm is a meteoro-logical station. There is a Central library near the municipal offices and seven branch libraries. The old Cloth Hall was demolished in 1930 under a tn. planning scheme; parts of the original building, including the pillars, clock-tower and door-way have been re-ercoted at Ravens-industrial centre H. is relatively a modern

Zeitalter des Glaubensspaltongen (1937). In literary criticism: Bulezeit der Romantik (1898), Ausbreitung und Verfalt der Romantik (1992). She was a bitter opponent of the Nazis, and when Hitler came to power in 1933 she resigned from the Academy of Arts and Sciences because she refused to take the oath of allegiance to the new regime. See E. Gillbchowski, Pas Schicksulsproblem bei Racarda Huch, 1925, and study by E. Hoppe, 1936.

Huchtenburg, Jan van (1646-1733), Dutch battle painter and engrayer, b. in Haarlem; pupil of Thomas Wyok and later of Van der Meulen in Paris.

Huckleberry, see Whort i perret, b. in Haarlem; pupil of Thomas Wyok and later of Van der Meulen in Paris.

Huckleberry, see Whort i perret, b. in Haarlem; pupil of Thomas Wyok and later of Van der Meulen in Paris.

Huckleberry, see Whort i perret, b. in Haarlem; pupil of Thomas Wyok and later of Van der Meulen in Paris.

Huckleberry, see Whort i perret, b. in Hall was laid in 1878; it is built in the foundation stone of the present of the Colhe and B. Holme, 16 m. S.W. of Leeds and 190 m. from London. It is served by rail and by canals. The surthe memorial stone of the present building was laid in 1821 and the name, Technical School and Mechanics Institute, changed to Technical College in 1896. In 1995 the College became affiliated with Leeds Univ.; its main depts, are chem. textile industries, civil and mechanical engineering, electrical engineering, physics mathematics, biology, school of art commathematics, biology, school of art, com-merco and economics and domestic science. There are six secondary schools, science. There are six sciendary schools, and primary schools are distributed throughout the bor. At what is now the Huddensfield College (Municipal Boys' School) the late earl of Oxford and Asquith, then known as H. H. Asquith, received his early education, he being a nephew of a former freeman of the bor.

The main sections of local industry are textiles, engineering, cloth dyelug, shrink-ing and finishing, manut, of chemicals and dyestuffs and wholesale tailoring. H. and the adjoining dists, are a natural centre of the weekler and worsted fabric industry of the W. Riding of Yorkshire In the Colne and Holme valleys there are scores of firms, many of them old estab individual, or private enterprises, which for generations have produced textile fabrics generations have produced textue fabrics regarded as their own specialities. In the Coine Valley are many of the larger mills which produce millions of yds. of cloths and tweeds. There are also numerous other trades carried on, notably printing and bookbinding; machine and hand tools; wood-working; sheet-metal working; furniture and cabinet making; rubber fittings; auxiliary textile equipment; brewing; patent glazing; dyeing; pottery; tanning and leather goods; boot and clog making; coach and motor body building; galvanised metal goods brick and cley ware; aerated waters; sports requisites (especially footballs in great quantities); confectionly; hosiory yarns; gas-producing and coking by-products plant; point; darpets and rugs; carrier bags; cardoard boxes; jams and preserves; pre-east cement using; constructional and building industries. regarded as their own specialities. In

tn., it is not entirely without historical la Plata State, Buenos Aires—now associations. It was mentioned in Domesta Book as Oderesfelt, and in Subsidy Rolls, dated 1207, as Huderesfeld but until the nineteenth century it certainly land. The early part of his life was grant and the positive accordance to that of occupied a position secondary to that of Almondbury which is now one of its suburbs. For this reason the historical monuments and associations in the area of the tn. are comparatively few; yet there are some survivals of interest, especially the older houses in the outlying dists, or in the tn. Itself in the courts off the main streets. Almondbury, with its anct, church, stocks, par, registers and pir, chests, and the old built-timbered pienu es adjoining, is much richer in historical associations; so al-o as regards many of the other areas adjoining the tn. of H. A few miles from II. at Lukley is the reputed grave of Robin Hood. The old Three Nuns Hotel is said to be named through the presence of nuns at the former Kirklers monastic estab, over which Hobin Hood's sister is suid to have ruled as abboss. Near by, at Cooper Bridge is the 'Dumb Steeple' commomorating the Luddite seen by, at sooper Bringe 18 the Dulling Steeple' commemorating the Luddite riots. At slack near Outlane, excava-tions have revealed the remains of a former Rom Comp, and smillar work at Castle Hill bas brought to light distinct traces of both Rom, and ther occupation of this hill a a natch towe, or camp and fortices.

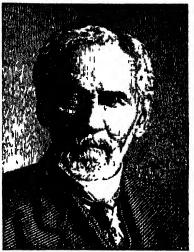

Hudnall Common, open space of over to see, Situated between Ashbudge Park and Whipsi ade, Heitfordshire, and

noted for its bud- and flowers.

Husson, George (1800 71), Eng. railway piomotor, the Rulway king, b. at Howsham, Yorkshire 116 started life 94 a linen draper, but in 1828 inherited a fortune of £50,000 this allowed him to interest himself in tailway promoting, with very successful results, and he became the dictator of rallway speculation. But the railway crisis of 1847-48 proved his rum, for he was accused of froud. Carlyle alluded to him as "the

Dutch E India Company, to discover the N.E. and N.W passages in 1607-10. In 1609 he explored the Hudson R.—On his last voyage in 1610 he discovered the Bay and Strait which are named after him. Early in 1611 his crew mutimed, and set him and his son with seven others adrift nim and his son with seven others addiff in a small boat, and nothing further was heard of him. The Last Voyage of Henry Hudson' is the title of John Collier's famous and pognant piture of the doomed navigator and his crew. See C. Asher, Henry Hudson, the Navigator, 1860; and studies by T. A. Janvier, 1909, and L. Powys, 1928.

la Flata State, Buenos Aires—now absorbed in Argentina; son of Daniel H. native of Marbiehead, Mass.; and grandson of Daniel H., native of Exeter, England. The early part of his life was spent on an estancia of the Argentine pampas. H. left S. America, 1809, and thenceforth resided in England. His wife, a musician (d. 1921), was much older than himself; they lived in various houses in London, tent on long given like tempers. went on long gipsy-like journeys into the country, and were sometimes in want. In 1901 H. was granted a Civil List pension, which he relinquished when his circumstances improved. H. writes as the

Rises in the Adironduck Mis., and flows

Rises in the Adirondack Mts., and flows about 350 m., roughly, in a southerly direction, into New York Bay. Its estuary, known as N. R., forms part of New York Harbour. It is navicable for small boats up to Glen Falls (200 m.), for small steamers to Troy (151 m.), and for large steamers to H. (117 m.). Much of the scenery on its banks is very flue, especially in the highlands of the H., part of the Appalachian Hange, below Newburgh. Chief tribs., the Mohawk, Walkill, Hoosic, and Sacondaga. It was first explored by Henry Hudson in 1609, and the first successful Amer. attempt at steam navigation was made upon it in 1807.

1807.

1807.

Hudson Bay, or Canadian Sea, inland sea of the N.W. of N. America, communicating with the Atlantic Ocean by Hudson Strait and with the Arctic Ocean by Fox Channel, Fury and Heela Strait, and the guif of Boothia. It lies entirely in Brit. ter., having Manitoha on the W., Ontario on the S. and Southenwitch Is on the N. ter., having Manitoba on the W., Ontarlo on the S., and Southaupton Is. on the N. A long narrow arm in the S. is known as James Bay. Area about 500,000 eq. m., length 80 to 1300 m., greatest width 600 m. It occupies a basin in the old Laurentian area, and is mostly shallow, with low shore-lines, especially in the S. and W. The average depth is 70 to 100 fathoms. The E. shores are rocky, and steep bluffs occur here and occasionally in the W. A chain of small is, here ally in the W. A chain of small is, her off the E. shore. There are few submerged rocks or shoals, but 'ee renders navigation impossible for three-fourths of the year. The climate is very rigorous of the year. The chimate is very rigorous in winter, but mild and pleasant during the short summer. The bay is the great drainage area of the Canadian N.W. Ters., and is fed by the Rs. Churchill, Nelson, Albany, Main, Rupert, sovern, and Moose, Three are fisheries of salmon, seal, whale, and walrus, and the surroundsear, whate, and warres, and the surround-ing country is rich in minerals and fur-bearing animals. York Factory is the chief port. The hay was discovered by Henry Hudson in 1610. He wintered in James Bay, and the next year was abandoned by his mutinous crew. See F. H. Kitto, The Hudson Bay Region, 1829.

Hudson's Bay Company, Eng. chartered company incorporated by Charles II. in 1670 and founded by Prince Rupert and other adventurers for the purpose of trading with the N. Amer. Indians on the shores of Hudson Bay. The estab-of the Amer. fur trade seems to have been due to the demand in the European mrkt. for large felt hats adorned with fur which hecame the vogue from the time of Charles I. In the search for the N.W. Passage Henry Hudson, by discovering the bay which is named after him, had found a route to the very edge of what is the greatest fur forest in the world. But Hudson died without being aware of what the hed accomplished. It remained for the Sicur Médart des Groseillers and his brother-in-law, Pierre Radisson, and through them the founders of the H.B.C., to reveal the value of his discovery for the fur trade. The first achievement of Groseillers, an Indianised Frenchman, was to penetrate to the Great Lakes and induce the Hurons to bring furs down to the St. Lawrence. It was then that he found that the Crees of the great N. forest were the real source of the fur supplies which reached the Fr. in the S. The Fr governor refused to issue to Groseillers a heener to journey thither, except on the condition that he received half the profits. condition that he received nuit the pronts. Groselliers and Radisson therefore went independently and returned (c. 1663) with a great supply of furs and were then charged and fined for fillelt trading. Falling to obtain redress in France the two men repaired to Boston to visit Sir George Carteret. Privy Councillor to Charles II. and through him they ultimately reached Windsor as guests of the king, who was equally interested in their king, who was equally interested in their proposals for a trading expedition in N. America beyond the confines of England's America beyond the confines of England's Amer. colonies. But progress was slow, and it was not until 1667 that Prince Rupert, the king's cousin, took up the project, with the co-operation of the duke of York (afterwards James II.) the duke of Albemarle, the earls of Arlington, Craven and Shaftesbury, Sir George Cartetet and James Hayes, secretary to Prince Rupert. All these were the original subscribers to the initial cap, of about \$110.000 and the commany's hist, really £110,000 and the company's hist, really begins at that date, when a convorted ketch, the Nonsuch, with Groselliers, salled for N. America, reaching James Bay on Sept. 29, 1869. The king loaned the naval hoat Eaglet which sailed with Radison, but at the local transfer. Radisson, but at Hudson Straft the Eaglet Radison, but at Hidson Strait the Eaguer was too damaged to proceed further. In St. James's Bay Groselliers then built Fort Charles—really only a poor log hut with a stockade, yet veritably the cornerstone of a great trading empire. Grosellers (called Mr. Gooseberry by the Kng.) soon sailed again with the Nomuch laden with firs. This successful Yoyage constitutions. with furs. This successful voyage confirmed the hopes of the courtier adventurers, who now applied to the king for a Royal Charter. This was granted on May 2, 1670. Wide imperial powers were conferred on the Governor and Company of Adventurers of England Trading into Hudson's Bay.' Rights to 'sole trade

and commerce within the entrance of the Hudson Strait were bestowed by Charles upon 'our dear and ontirely beloved cousin Prince Itupert' and his associates, who, according to the Charter, were to be 'the true and absolute Lordes and Proprietors' over more ter than was then even known to Luropeans. In pro-ont-day geographical terms, the Adventurers were granted the Provs. of Ontaine and Quebeo N. of the Laurentian Hills and W. of Labrador boundary all Mantoba and Saskatchewan, the half of Alberta and the SE corner of the NV Ters It proved to be a will drafted (harter for it validity in the law courts. The ki in Quebeo and Montreal soon took up the quebeo and montreat soon took up the challenge of the I ng entry into the Amer fur trade from the N and for nearly a century the king and I r. struggled for the trade, in a long drawn period of war, with intervals of peace, lasting till 171; these intervals being accompanied by out breaks of violence on the shores of the bay These were for the most part mere forest skirmishes, insignificant as measured in terms of military operations, but they were significant in the hist of Canada, and the fact that the company defended ing interests for so long served the Com pany in good stead wit i the Charter Rights came to be considered by a Pari

Committee in 1749
By 1680 there were forts at Rupert R., Moose, and Albany, Factories in James Bay, and Fort Nelson (or York Factory) on the W coast of Hudson's Bay. Sev on the w coast of fluoson's Ray. Sev of these were taken by the Chevalier de Troyes and in 1697 as the result of a sea right when the Sieur d'Iberville's ship Pelican off York Lactory defeated three Eng ships under Captain Bailey who was in command for the company The company was then left with but a single roset out the how Albany Ragtery. post on the buy, Albany Factory The Treaty of Rywick brought peace to Hudson's Bay but it left the company almost ruined Two notable mames in amost rumou I wo measile names in the hist of the company at this period were those of Henry kelsey, who entered as an apprentice in 1684 and undertook a journey into the practic lands, and James Knight, who was one of the first to estab discipline both w thin the forts and in the relations with the Indians. Kelsey is notable as the first of the company's servants to establish that understanding, which was to prove the most powerful factor in the development of the fur trade factor in the development of the fur trade in Canada. His Journal's became the subject of political and later historical controversy which was only finally cleared up in 1926. From 1697 1713 (Treaty of Utrecht) the company's sole post on the Bay was Albany. The duke of Mariborougi, whose victories culminated in the Treaty of Utrecht, had been a governor of the company. The Treaty brought the bay forts back to the company and the reafter the company was to have nearly eventy versy of personnel.

and commerce' within the entrance of | Factory at the mouth of the Churchill R. to enable the Chipewvans from Great to the bay Thus was Churchill (then

to the bay Thus was Churchill (then called Prince of Wales's Fort) estab Meanwhile the ir through Pierre de Varennes, Sieur de Verendrye, renewed attempts to accure part of the fur trade, W of the Great Lakes, and set up a number of trading posts in the W Prairie, a challenge to the chartra and rights of the ill BC From 1754, therefore the company's servants began to ponetrate the W. Flus, Anthony Henday travelled for a year with Indians, going as far as the Rockies. A notable name in the company's annils of this period was that of Samuel Hearne, who began as mate in a company whaling ship and later (1776) was stationed at Prince of Wales a Fort on Churchil R. a stone fortress which had replaced Knight's wooden fort on Church-Hourne was the first white man to reach the Arctic sca from the interior, having reached the mouth of the Coppermine R This stone fort had only been completed in 1771 after nearly forty years labour but in 1782 Hearne, the governor, surrendered it to La Perouse without firing a shot —he having only thirty nine men in the garrison. The Fr attempted to blow up the fortress without success. The main walls of this very strong fortress survive as an historic site owned by the Dominion of Canada.

It was about the year 1784 that saw the dawn of the historic rivalry of the N. V. Company, which was destined to become the strongest of all the H.B.C.'s competitions. This competition was in effect that of the Hudson Bay and the Montre il routes for the trade of the great fur forcet. But subjects in Montreal fur forest Brit subjects in Montreal following La Vérendrye's precedent, built po-ts among the Indians and again dive ted trade into the Montreal route. In 1774 the H.B.C replied by building Cumberland House, near the House, near the Saskat-Among the well-known chewan R. names of the pioneer traders of the N W. (ompany were those of Problaher, Alexander Mackenzie, Mckay, McLoughin, all courageous and enterprising Scottish-(madian traders from Montreal, who and the Rockies into the Arctic Ocean in and the Rockes into the arrive crean in defince of the monopoly rights of the H B C. Forts were built in juxtaposition at trading points but before the two empanies were in riged in 1821 there was to be violence and bloodshed, arrests and itugation. It was Alexander Mackenzie, nest famous fur trader of his time, who that went up the Peace R. (1793), was knighted after the pub of his Foyages and produced a plan for the union of all the fur trading interests in one great chartered company having the use of the Hudson has route and he tried to buy out the been a governor of the company. The law route and he tried to buy out the treaty brought the bay forts back to the H B C, through Lord Selkirk, who then company and there after the company was controlled the company. But Selkirk controlled the company but Selkirk controlled the company wedderburn trading. In 1715 Knight sent Wm. (Andrew Colvilo) i reorganising the Stewart into the interior as an arbitrator of peace with the Indians, notably the Colony Scheme (1812) This colony was Crees. Knight built a post N. of York taken over by the H B C. in 1836, with a company's charter—a governor and council appointed by the governor and committee in Loudon The union of the two companies was accomplished by a deed of co partnership and this developed

the tn. of Almeria, is near an important mining dist. and has considerable trade in agric. produce. Pop. 16,367.

Huerta, Adolfo de la, was governor of the Mexican prov. Souora when it seceded, April 1920. When revolution displaced Carranza on April 23, H. became provincial president of Mexico: confirmed in office (after Carranza's assassination) May 21. He was only a stop-gap—Obregón being inaugurated in Dec.

Huerta, Victoriano (1854-1918), Mexican president and generalissimo, b. at Colotian of Indian parents. Educated in the Military College, Mexico City, as a result of the interest taken in him by Juarez the Mexican President. Became

Juarez the Mexican President. Became a lieuxmant of Engineers in 1877, after a most successful career in the College. On active service in various parts of Mexico 1878 1912, being promoted to the rank of general in 1901. His prin. service during this period was to suppress the Chihuahua rebellon in 1912. Made military com-mandant of the Federal Dist. in Mexico City in 1913. When Lascuram resigned. Huerta became Interim President. At this time the ex-President Madero, who was awaiting trial for treason, was, to-gether with Suarez, the ex-Vice-President, murdered while being conveyed to the Penitentiary. For this act, which may or may not have been instigated by him, II. incurred the utmost odium throughout the U.S.A. and his protracted conflict with America may be said to have begun from that date (Feb. 1913). Gen. Carranza aided by Gen. Villa, headed rebellious against him after he had been confirmed in office. No efforts on the part of President Wilson at mediation were successful in reconciling the insurgents with H., whose ruin was completed by his own folly in repudiating the National Debt

War, in which the only part he played was to endeavour to lead a revolutionary

force into Texas.

Huesca: (1) Prov. of Aragon, N. Spain, bounded on the N. by France and on the bounded on the N. by France and oil the R. by the prov. of Lerida. Area 5819 sq. m. Pop 224,500. Hughes Capet, see Ciplit, Hughes.
Hughes, Charles Evans (1562-1948),
Amer. lawyer gud statement.

Amer. lawyer and statesman, b. at Glen Fulls, New York, son of Rev. David Charles H. Educated at Colgate and Brown Univs., and the Columbia Law School. He was prof. of law at Cornell Univ., 1891-93. In 1905 he won prominents nence as the attorney for the Armstrong Legislative committee, which investigated the methods of the life insurance companies incorporated under the laws of New II. became the mevitable candi-York. date of the Republican party for governor of New York. He was duly nominated in 1906, and the Democrats nominated W. R. Hearst, the new-paper proprietor. H. was elected, and re-elected in 1908. In 1910 President Taft appointed him an additional for the U.S. Supremental Control of the U.S. Suprem associate Justice of the U.S. Supreme Court. In 1916 the Republican party again nominated him and ho at once resigned from the U.S. Supreme Court and began a vigorous campaign. On the night of the election on Nov. 7 it was found he had carried the whole of New England evcopt New Hampshiro, Now York, New Jersey, Indiana, and Illinois. It was assumed that H. had been overwholmingly had the better that the control of the cont elected; but the far W. states were still of the Democratic slogan about Wilson—ile kept us out of the War.' For sev. BARON VON HÜGEL

BARON VON HÜGEL

Hügel, Baron Friedrich von (18521925), Catholic religious writer; b. at had lost his great opportunity through the

failure of his managers to mend the breach in California, but even in other parts of the country he did not obtain the support that had been expected. He then returned to the practice of the law in New York, where, upon the United States' entry into the war, he acted as member of the draft appeal board and took charge of the draft appeal board and took charge of an inquiry into aircraft. In 1921, when President Harding held the reins of gov., he made II. secretary of state. The most notable event of his term was the arms conference held in Washington in Nov. 1921. As president of that conference he did much to bring about an agreement that led to a closer understanding between the United States and Great Britain. There was also the four-power treaty bethere was also the four-power treaty between the U.S V. Great Britain, France, and Japan regarding their is, possessions in the Pacific, and the cancellation of the Anglo-Jap. alliance. H. held on as secretary of state for a time under President Coulding and the section of th Coolidge and then resigned to resume the practice of law. He was Judge of the Permanent Court of International Justice, Permanent Court of International Justice, The Hague, 1923-30; President of the Amer. Society of International Law, 1925-29; and Chief Justice of the United States, 1930-11. An impartial judge he found himself compelled, like his nuige he found himself compelled, like his associates, to declare invalid and unconstitutional a great number of the laws passed by Congress at the histance of President Frayklin Roosevelt as parts of the 'New Deal.' He pub. The Pathway of Peace (1925), The Supreme Court of the United States (1929), and Pan American Peace Plans (Yale Univ. Lectures, 1929). Hughes, David Edward (1831-1900), Anglo-Amer. inventor, b. in London; went to Virginia in 1837; in 1850 became Prof. of nuisic at Bardstown College. Ken-

Prof. of music at Bard-town College, Kentucky. His inventions include an improved telegraph type-printer (1851-55), and the microphone (1875), which wasproduced almost simultaneously by Ludtge. He was made F.R.S. in 1880, gold medallist of the Royal Society in 1885, vice-president of the Royal Institution in 1891, and Albert medallist of the Society of

Arts in 1893.

Hughes, Sir Edward (c. 1720-94), Eng admiral b. at Hertford and entered the navy, 1735. He assisted in the attacks on navy, 1753. He assisted in the attacks on Cartagena and at the taking of Louisburg and Quebec. He became commander-in-chief in the E. Indies, 1773. During 1782-83 ke had five encounters with the Fr., and was made admiral in 1793.

Hughes, Hugh Price (1847-1902), Weish Wesleyan mmister, b. at Carmarthen educated for Wesleyan Methodist ministry at Richinond College. In 1884 he became prominent in London at Brixton Hill as a leader of the Forward party, and in 1885 started the W. London Mission. In 1885 he became editor of the Methodist Times. in 1896, first president of the National Council of the Evangelical Free Churches, and in 1895 president of the Wesleyen Methodist Conference, See life by his

dangkter, 1904.
Hughes, John (f. 1869). Welsh iron and shipbuilding mester. After his apprenticeship in Ebbw Vale, Wales, he

estab. a factory at Newport. Then directed a Miliwall iron and shipbuilding yard and made the Miliwall shield, a resistant armour which interested Russia, Toured the Russian mines, and, in 1869, founded a company to supply all Russian railways with iron. Before the 'Hughes works' were set up with 3000 men employed, there had been a vast stoppe with primitive peasants and 'tchumaks' or carriers driving bullocks for grain transport. The H., father and sons, came to the Don country, which then soon outstripped the Irals of those days with many iron-works. The contre was named Hughesovka or Yuzoika. This in, ultimately was renamed Stahno (a.p.) resistant armour which interested Russia.

mately was renamed Stalino (q.r.).

Hughes, John (1677-1720), Eng. poet b. at Mariborough, Wiltslire, and educated in London. He became a clerk in the ordnance office. He was delicate, and suffered mach from poverty til his appointment as secretary in the Court of Channery. His best work, The State of Danascus was produced at Drury Lane Theatre (1/20), but he died the same evening from consumption. Besides his access to the best of building the same of the same evening from consumption.

evening from consumption. Besides his poems, he wrote a History of England (1706), The Works of Mr. Edmund Spenser (1715), and contributed to sevengeriodeals. See S. Johnson in The Lices of the Ports, vol. ii., 1784.

Hughes, Richard Arthur Warren (b. 1900), Welsh suther. Educated at Charterhouse and Oriel College, Oxford. Earliest work was The Sister's Trayady (play) and Gipsy-Night and other poems) both pub. in 1922. These were tollowed by A. Comedy of Good and Evil (1925) and Confessio Jurenis (collected poems) (1926). H. was the list dismutist to (1926). H. was the first dramatist to write specially for brondensting and he write specially for boundaring and no has been associated with the Welsh National Theatre. He is, however, best known for two nosels: 1 High II ind in Januara (1929) and In Huzard (1938): the first-named being a story of some children who fall into the hands of modern pirates, notable for its original narrative style and for its convincing interpretation ot the monitor the convincing interpretation of child mentality; the second, a vivid story of a ship's adventures in a burricane, Other works: A Monunt of Time (short stonics, 1926), Collected Plays (1928), The Spider's Palare (stories for children, 1931), Don't Blame Me (1910), City of Angels (1941), and Her Fabulous Fortune (1941) (1913).

Hughes, Sir Sam (1853-1921), Canadian general; b. at Darlington, Ontario, Educated: Toronto, Normal School and Univ. In S. African War he was Assistant inspector control of communications; attenuards chief intelligence-officer to Sir Chas Warren. In 1911 be was ap-pointed minister of militia and defence; and he had a great deal to do with pre-paration of Canadian force that fought in the First World War. K.C.B. and major-

general, 1915.

Hughes, Thomas (1822-96), author, began life as a barrister and a follower of Frederick Denison Maurice and other leaders of the Christian Social School. He was a founder of the Working Men's College, and prin. of that institution from 1872 to 1883. He sat in Parliament from 1865 to 1874, and was a co. court judge from 1882. The author of sev. books and many tracts and essays, his fame rests entirely upon Tom Brown's School Days, pub. anonymously in 1877. It is a simple story of public-school life, admirably presented, and underlying it is a strong, sound religious sense, that had the greater influence for not being unduly obtruded. See M. L. Parrish and B. K. Mann, Charles

Kingdey and Thomas Hughes, 1936. Hughes, William Morris (b. (b. Australian statesman; b. in gomery hire, Wales Educated: Mont-Llandudno (franmar School; St. Stephen's church school, Westminster, Emigrated to Australia, 1984. Worked as farm hand, to Australia, 1884. Worked as farm hand, coasting sailor, labour organiser. Member of Parliament since its estab. in 1901. Called to N.S.W. Bar, 1903. Minister for external affairs, 1904. Attorney-general, 1908 09, again, 1910-13; and again 1914. Fisher resigned premiership in 1915, and H. took his place. He visited England, then in the turnoil of war, in 1916, was made P.C., and preached an importalism little to the tasts of the Ritt. imperalism little to the taste of the But. Labour Party. He had become essen-tially a war-premier, failed to carry conscription, fell out of favour on the coming of poace, had to resign in 1923, and in 1929 legan forning a ne group called the Australian party. In that year he pub, an evangel of empire called The Splendid Adventure. Joined the Commonwealth (1908, as vice president of the executive council, 1931-3); and again in 1937-33. Minister of health and repatriation (Lyons Gov.), 1934-3; 1936-37; of external atlairs, 1939-40; attorney-general and minister for industry, 1940-41; minister for the Navy, 1941-44. Hughesovka, 8(SALINO, Hugh of Lincoln, St. (1) (c, 1135-1200). of peace, had to resign in 1923, and in 1929

Hugh of Lincoln, St. (1) (c. 1135-1200), bishop of Lincoln, b. at Avalon, Burgundy, of noble parentage, entered the Grando Chartreuse about 1160, and became bursar there. Rose to the office of procurator which brought him into touch with the outer world; and about 1175 he was invited to England by Henry II., to estable the world; and about 1186 he became thusian monastery. In 1186 he became at Witham, Somersot, the first Eng. Carthusian monastery. In 1186 he became bishop of Lincoln; in 1189 went on an embassy to France; in 1194 excommunicated King John, and in 1198 led the first rofusal of a money grant. He was canonised in 1220. The chief hit of St. H. is the Magna I da S. Hugons (in MSS. in the Boddhian Library) written by in the Bodlelan Library, written by Adam, private chaplain to St. II. Sce also Canon Perry's Life of St. Hugh of Avalon, 1879; and life by Marson, 1901. (2) (c. 1246-55), Eug. Christian child who is traditionally alleged to have been at the age of eleven crucified by a Jew of Lincoln, named Copin, after having been tortured and starved on account of his faith. body was buried near that of Grosseteste in Lincoln Cathedral. The story of his martyrdom was a favourite one with Eng ballad-makers and chroniclers. It is the theme of the 'Prioress's Tale 'in ('haucer's Canterbury Tales, and is also referred to by Marlowe.

Hugh Town, tn. and cap, of the Scilly Is., Cornwall, on St. Mary's Is. Hughl, Hooghly, or Hooghy: (1) most westerly and most important of the mouths of the Ganges, India, formed by the con-fluence of the Bhagirathi, the Jalang, and the Churné streams. Its length is about 200 m., and it is about 10 m. wide at the mouth. It is the only mouth of the canges navigable by large vessels, which can safely go up to Calcutta. Navigation r, however, much hindered by silting and the formation of sandbanks. The 'bore' the formation of sandbanks. In the both and the same and the both. The both is often of great height and velocity. The H is held sacred by the Hindows. (2) Cap of dist. of same name, W. Bongal, India, on R. H., 23 m. N. of Calcutta. The thief building is the Inambarra, a Muslim institution. The tn. was founded about

Institution. The fn. was founded about 1337 by the Portuguese, who were driven out a century later by the Mohammedans Pop., with Chinsurah, 50,000.

Hugo, Victor Marie (1802-85), I'r. poet, diamatist, and novelist, b. at Besingon, the son of Gen. H., an officer in Napoleon's army. His childhood was full of change, as the family usually followed their father and the army, and he was diu at the Feuillantines in Paris (1809-11, and 1813-10), at Madrid (1812), and at the Ecole Polytechnique. His poetical genius asserted itself very early in 1816 he produced a tragedy: the next In 1816 he produced a tragedy; the next year was nearly successful in an Academic competition; in 1819 began to contribute to the newly founded Conservature Litterare; and was soy, times the victor at the floral games of Toulouse. In 1822 he made his real literary debut with Odes et poesus diverses. This vol. contains no et possus diverses. This vol. contains no great innovations, but is remarkable for strength and beauty of diction and great dexterity in the handling of difficult rhithms. In 1823 he pub. anonymously the contains Han d'Islande, a fantastio and extravation d'Islande, a fantastic and extrava-gant proso romance, dealing forcibly, but with an utter disregard of possibilities, with a N. bandit. It was followed by Bug Jargal, a similar production (1826). His second vol. of poems, this et ballades (1926), and his third, Orientales (1829), demutely mark the trend of his tastes and opinions. They are 'romandie' in the extreme, the subjects being barbary and fantastic, the metre varied and and fantastic, the metre varied and irrigular, and the language glowing and exote, but the matter is still rather empts and purille. His first attempt at drama appeared in 1825. Commell, which was never acted, is hore a romance in diamatic form than a true drams, but is of some importance in literary hist. It was preceded by a somewhat paradoxical and incoherent preface, which served as a manifest of the new romantic school, asserting the draumtist's independence asserting the dramatist's independence and emancipation from all the old conventions. Its pub. made H. the recognised head of the new movement, a position in which he took himself and his mission very seriously. In 1830 Herman, the first of his typical dramas, was acted at the Théâtre Français. Its subject is the suicide of a noble Spaniard at the moment of his marriage, on account of a point of honour. Its style is in direct

antithesis to all the traditions of the Fr. antibesis to all the traditions of the Fr. stage. The language, though gorgeous, has none of the old classical periphrasis, the Meandrine metre is completely changed in character by constant over lapping, and the old dramatic laws are set at nought—the play was the text of long and violent contention between the Classicists and the Romanticists, and this circumstance has given it a fections circumstance has given it a fictitions importance, since in spite of the splendid march of the verse and the gorgeous diction, Hernam is lacking in some of the principles of dramatic art.

VICTOR BLGO

In 1831 a correspondingly revolutionary production in the realm of prose tomance appeared in Votre Dame de Paris, a pre tentious but picturesque novel of medieval Paris, which shows the influence of Sir Pails, which shows the innuence of Sir Walter Soott. Its failings are a lack of proportion and humour, and an incompleteness of construction, but to the average reader these are it may rate at dirst, completely outweighed by If 's wonderful faculty of describtion, command of passion, and splended and poetical language. In the same very Humour of lyric and contamn lative verse, which contains and contemplative verse, which contains some very fine poetry

The next few years were or ipled in the production of dramas on the lines of Heriam Marim Determe, which appeared in 1311, is usually considered his best. The next year saw to Rois amuse, interducted after the first night, which has

contains however, some wonderful witting. All these dramas show command of linguage and fortility of invention, but are lacking in constructive irt, which probably accounts for the waning of their popularity Their production was intersperse I with that of sev vols of chaining sperse with that of sev vols of chatming verse viz Chants du orepuscule (1857), les Folz interieures (1857), en l Les Ruyons et les ombres (1840), and he also issued during this decade Claude thieux (1831), Lutterature et philos phie melles (1834) a collection of juvenilia and La Lameralda (1856), an opera for Mile Harrin Bertin

H a politic il opiniona had in the meantime been undergoing considerable B Previous to 1830 he had been changes an ardent lesitimist, but during the reign of Louis Philippe he became a constitu-tional royal st sitting in the Assemblée tional royal st sitting in the Assemblée Constituante as a representative of l'aris, later an extreme Liberal, and fin ills, on his election to the Assemblée Législative in 1845 a democratic republican After the coup detail of 1852 he was bamished for opposition to Louis Napoleon, and fied to Brussels and then to Jersey During this time his literary output, was mainly to Brussels and then to Jersey During this time his literary output was mainly confined to journalism and pamphicteoring, but he soon resumed more scrious work in cule The first work to appear was Vapulom le Petit, the least literary of all his works In 1555 he issued Les Châtimunts giving vent to his anger against the second Empire The book is notable as a rare example of lyric sature, ie a combination of true poetry with invective After three years of silence, he emerged in an entirely different light with Les Contemplations (1956), a collection of lyrics remarkable for beauticoncron of vries remarkable for beautiful expression, simple diction, and breadth and profundity of thought In 1959 appeared the Légende des Siècles, a collection of narrative and pictorial poems dealing with different periods of the world's light that the support of the state of the second section. hist, which, though somewhat unequal, contains some of his masterpieces Among the best of the poems are Arg-merillot Le Petit Ron de Galice, and Lyradmus

In 1862 H usaued Les Musérables, a long and unequal prose romance dealing with modern life Its descriptive portions are remarkable and much of the writing is remarkable and much of the writing is touching and sincere but the style is full of maintenant, and the plot abounds in absurdates. William Shalespeare (1864), was a strange and rhapsodical vol of criticism, containing some tine passages of ornate prose. In 1865 there appeared Chansons des rues et des hous, a collection of light lyric verse, notable for its style. It shows it in rather a new light, and the grace delimings, and with of some of those areas of allumings, and with footnoted the style of the sty grace, daintines, and wit of some of those grace, dainting, and with or some or those poems, though not always free from laboured mannerism, show the extraordinary aduptability of his gonius. Les Iravailleurs de la mer (1867), another prose romance, is a tale of passionate adventure and self sucrifice, and contains interdicted after the first night, which has gained a worli wide reputation as Rigo-leito They were followed by Lucrice Borgia (1833), a melo irama, Marie Tudor (1833), andelo 1835), a prose melo-drama, Ruy Blas (1838), which stands second among his plays; and Les Burgrases (1843), a kind of sentimental epic clumsily put into dramatic form, which Though full of power, it is rather extrava

gant, and the general effect is over-whelming and almost weerisome.

After the revolution of 1870, H. re-turned to France and again entered politics, though not with very happy results. He was elected to the National results. He was crected to the reaction.
Assembly at Bordeaux as representative for the Scine, but soon resigned. He remained through the rule of the Commune and defended the Vendôme Column as long as possible and then retired to Brussels. He was expelled from Belgium on account of an imprudent speech in on account of an imprinent speech in favour of the Communists, and returned to France, where he unsuccessfully stood for Paris. He lived in France till his death, in considerable literary and general popularity.

The writings of this last part of his life are of comparatively little importance.

They include: 1/4 net terrible (1872)

are or comparatively in the importance. They include: L'Année terrible (1872), almost his weakest hook, a series of eloquent pictures of the war, full of praises of France and invective against Italy; Quatre-Vingi-Treize (1874), another historial reconstruction of wareaches. forical romanco; a collection of speeches and addresses in 1875-76; Seconde Legende des siècles (1876), which, though not equal to its prodecessor, is still full of vigour; Historic d'un crime (1877), des-cribed as 'the apotheosis of the Special Correspondent': L'Art d'être grand-pere (1877), containing muc'i, 'bat is charming, but a good deal of 'sentimentalism': Le Pape (1878): La Pitié Suprême (1879), L'Ane (1880), Les Quaire Vents de l'Esprit L'Ane (1880), Les Quatre Vents de l'Esprit (1881), a remarkable hast flash of genius; and Torquemada (1882). He died on May 22, and his funeral was marked by a great display of public feeling.

H.'s position in Fr. literature is important in that he not only bestowed on Fr. romanticism a peculiarly 'decorative' character, but actually kept the romantic

spirit alive in France for some thirty years after its apparent decease. As a writer his powers were wonderful. To name only a few of his characteristics, he is only a few of his characteristics, he is notable for vitality, wide scope of genius, graceful lyrical power, rhetorical magnificence, the ability to express pathos, awe, and indignation: wealth of colour and light; variety of style, and consummate skill in the handling of metre and language. His main defects are a lack of humour and proportion, and an allof humour and proportion, and an all-pervading egoism, but despite these he stands on a level with the great names of international literature. See E. Biré, Victor Hugo, 1880, and other vols. by the same author; E. Dupny, Victor Hugo, Phomme el le poète, 1887, and La Jeunesse de Victor Hugo, 1902; F. Gregh, Etude sur Victor Hugo, 1915; Mme. Duclaux, Victor Hugo, 1921; E. M. Grant, Victor Hugo, 1921; E. M. Grant, Victor Hugo during the Second Republic, 1935; P. Zumthor, Victor Hugo, poète de sulan, 1946. 1946.

king of Navarre and the duke of Conde, and opposed to the Catholic party, headed by the Gulses. The strife between them by the Guises. The strife between them developed into the long series of religious wars which began in 1562. Civil rights were granted to the H. by Henry IV. in the Edict of Nantes (1598), but this was revoked by Louis XIV. in 1685, and many Protectors were distant.

revoked by Louis XIV. In 1685, and many Protestants were driven out of France. Perfort civil equality was secured to all denominations by the revolution of 1789 See also France.—History.

and lawyer, b. in Overton Co. (now
Pickett), Tennessee, U.S.A. Studied at
National Normal Univ., Lebanon, Ohio.
Became a lawyer and judge. Sorved as
a captain in the Cuban War of 1898
Namber of Tennessee House of Repres Member of Tennesses House of Repre-cutatives (1893-97), then a judge in Tennessee (1903-07). Was Demograf Re-Huguenots, name applied to the Fr.

Protestants of the sixteenth and soventeenth centuries. The party grew up
during the reigns of Francis I. and
Henry II., and under Francis II. developded into a religious-political organisation, incree in the Party. Was the loading
into a religious-political organisation, incree in the Party. Was the loading
into in the Party.

Like Roosevelt he showed, World hist. World hist. Like Roosevelt he snowed, as early as 1933, that he belonged emphatically to the internationalist, as opposed to the isolationist, school of thought. Won a signal victory for liberalism with his reciprocal trade agreement law, and the beautiff belong the history was a proper to the control of much credit belongs to him for many trade treaties which achieved an unexpected success, though a fanatical adherence to the obsolete doctrine of smooth favoured-nation treatment has virtually limited these trade agreements to commedities of which the other party is the sole or main supplier (E. H. Carr). An unremitting advocate of tariff reduction the world over and the unflagging opponent of mercantilist policies or of any-thing that operated against conomic over all opposition in Congress and put all scoffers to rout. When H. entered the state Dept. in 1933 his one aim was to secure the reduction of tariff barriers, and though when he left that dept. in 1911, the thought in terms of free trade and the rule of international law. With Roosevelt he was in Advance of Amer. opinion, in 1937, on the Sino-Jap, war, and would have taken positive steps to hamper Japan's aggression. In 1938 he unofficially declared 's moral ambargo' upon the shipment of airphases to all countries which engaged in the a rial bombardment of civilians. Though the pendulum, at arst, swung but lowly from isolationism to internationalism, it is due to H. (next to Roosevelt) that the Amer. people were awakened to their dancer, and as a foreign minister he stands in the line of Adams. Wensicr and Hav. If persistently avoided commitments even in war time, except for the commitment to the vague phrases of the United Nations. When 'normal' conditions returned no counted on an improved Wilsonian system—where Roosevelt relied on his personal contacts with the rulers of the Great Powers neither R. nor Roosovelt seems to have envisaged the policy bading to permanent nulitary commitments and continuing economic action. See The Memors of Cordell Hull, 1943.

Hull, or Kingston-upon-Hull, parl, and so, bor, and riv, port of the E. Riding of York-hire, England, at the junction of the R. Hull with the R. Humber, 22 m. from the N. See, 38 m. S.E. of York and 181 m. N. of London. For more than 700 years the port has been in existence, H. having been famous since the days of modieval ships. Situated as it is on the N. bank of the Humber, which is the N. bank of the Humber, which is the accommodation and equipment for the rapid and conomical handling of goods. consigned to or from all parts of the world. Pop. 1938 (est.) 318,700. 1948 (est.) 293,000.

Port, docks and trade.—The port accommodation comprises ten docks, with a water area of 200 ac. and 13 m. of quays and has a frontage to the Humber hold requisites, blue, starch, chocolates, of over 7 m. The King George Dock surgical dressings, machine beiting, elec-

covering 53 ac. (entrance 750 ft. long and 85 ft. wide) is the largest and best equipped dock on the N.K. coast, and when a further extension is completed it will contain an area of 85 ac. It has a large grain silo at the W. end, 2 graving docks, electric cranes, and an 80-ton floating crane. Alexandra Dock (53 ac.), with a depth of 32 ft., can accommodate large occangoing steamers. It is used to a large extent by the grain trade and for the export of heavy machinery, chemicals, iron, and steel. The Victoria Dock (25 ac.) is the chief centre of the timber covering 53 ac. (entrance 750 ft. long and (25 ac.) is the chief centre of the timber import trade. The Tn. Docks (Humber, (25 ac.) is the continuous fine trade. The Tn. Docks (Humber, Railway, and Princes) (total area 18 ac.) are used chiefly by vessels in the continental and coastwise trades. St. Andrew's and Extension Docks (194 ac.) are the coast for the fishing trade. The Salt End Oil lettles are an ocean depot for discharging and loading mineral oils. The Railway Executive owns five public dry docks and seven other dry docks are operated by sev. companies, mostly marme engineers. The R. H., which rises in the Yorkshire Wolds and flows into the Humber, is a valuable asset to the city and port, for it provides a ready means of warehouse accommodation and is of great economic value to manufac-turing omerns. Stemers up to 200 ft. In length use the Old Harbour, which is the in length use the Old Harbour, which is the term given to the lower part of the R. II. Coll is conveyed from Yorkshire and the Midlands by riv. craft to the mills and gasworks on the R. II. No Brit, nort stands so well naturally or economically as If for riv. or canal barge traffic, Inland water maygation and transport ink II. with Leads, Sheffield, and numerous other this, of Yorkshire and the Midlands. Altogether II. is the base of 600 m. of inland water navigation.

The culef trades using the port, are:

The colef trades using the port are; gram, truber, wool, full, dairy preduce imported ment, coal exporting, and cold storage. There is storage accommedation for over 750,000 quarters of grain (in 1938 grain imports into II. were 1,166,855 tons). II. is the second largest soft-wood importing centre of the United Kungdom, and in 1939 timber imports exceeded a million loads. Wood imports in 1933 amounted to nearly \$1,000 tons. The II. tishing industry, which is the largest single business existent in II. is now donn fled at St. Andrew's and St. Andrew's Extension Docks at the W. and of the city and represents a self-contained community with ne factories, fish meal and oil works, ship-repair and engineering shops, all owned and conducted by the fishing trade. The Fish Mikt, which was reconstructed in 1933, embracing mer-chants office, post office, banks etc., is already made mate to meet expanding need4

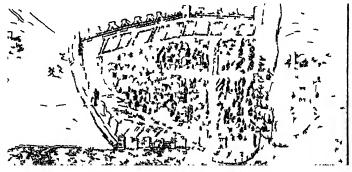

Industries. II. has large ship-repairing nuturies. II. has large sop-repairing and marine cucineering estable, manufs, of oil, paint, colours, machinery, ropes, chemicals, tanning, milling industries, sawmilling, industries dechol, margaring, cement, central heating apparatus, housetric lamps, fish oils, fish meal and cured fish. H is the chief centre of the seed crushing and oil extraction trade in the kingdom A branch of this industry is the manuf of feeding cake and meal for It is one of the largest and oldest centics in the world for the manuf of all centres in the word in the institution of paints, charmels, colours, polishes, stains, distempers, and varnishes. The laundry blue and starch industry commenced in H in 1811, and the making of ultramatine, which is the basis for the blue now used in household washing, was but now used in nouscinois washing, was begin in 1883. The stairth made here is a rice product and is sold in packets. Figureering has been one of it s staple industries. See im was in its infancy when the industry began in H in a small part of the content of the content. In 1902 the first force concrete bridge to be built in Linglind was con structed in H. Allied to the ship building industry is that of marine engine construction and ship repur work, and to dry about 8000 men ind employment in those and the general engineering industries industrial alcohol is pro duced on a large scale, and among other chemicals produced are acetic acid acctone, but all alcohol and many allied chemicals of the first importance to such industrice as artificial silk, cellulose lacquers, pharmaceutical chemicals, and textilen

Hullings—The prin churches of H are the great church of Holy Trinks beside the mist place, which dates back to the thirteenth century. Its tower is 1:0 ft high and the church is 272 ft long. The chancel, in the Early Eng style, 19 said to be one of the oldest buildings of said to be one of the eldest unidings of bick in the kingdom still in use for the original purpose. The rest of the fabric is of stone and mainly of Late Perpen dicular date. Holy Trinity is the only building left which shows the importance which Edward I attached to his new foundation and the church was designed from the first to serve a great city st Mary's Chuich, I owgate, originally built by the Knights Hospitallers of V Ferriby, dates from the early fourteenth century. It is said that Henry VIII caused a large part of the church to be removed for the enlargement of his manor house St Poter's Church, Drypool, near Victoria Dock, though not within the in at the Dock, though not within the in at the date of its building is reputed to have been built originally in the reign of Edward I The present building, constructed about 130 vern ago, is the third on the site, and this stands in ruins as a result of enemy action during the Second World War Among the other notable buildings of H are the city hall and dock offices, the central library in Albion Street, the Forens art gallery in Queen Victoria Square the Guildhall and Law Courts, the central police station, and the Wilberforce monument Wilberforce House, High Street, a fine Elizabethan manor and by of Wm. Wilberforce, the philanthropist, now serves as the city's historical museum and memorial to Wilberforce. Among educational institutions of the Manthes offices, the forens art gallery in Albion of the Street, the Forens art gallery in Qucen Victoria Square the Guildhall and Law Courts, the central police station, and the Wilberforee monument Wilberforce House, High Street, a fine Elizabethan manor and bp of Wm. Wilberforce, the philanthropist, now serves as the city's historical museum and memorial to Wil historical museum and memorial to Wil berforce. Among educational institutions the Nautical School and School for Fishermen, the Trinity House Navigation is a leading port, its trade depending on

School and the Marine Fugineering and School and the Marine Engineering and Wircless Telegraphy and Telephony Depts of the Felmical College serve the special needs of H's maritime pop. The Technical College, the College of Arts and Crifts and the College of Commerce are large and well equipped colleges. The Univ. College, opened in 1928, provides courses in preparation for the external degrees of the univ. of London in Arts, School Low Fernance, and Compares degrees of the univ of London in Arcs, Stance, Law, Economics, and Commerce History—II clearly these its name from the R II, on whose r b a trading place was estab at least as early as the twiffth century. The bist of 'H.,' however begins with the tuship of Wyke, the port being referred to in anct doen ments as 'Hulmo' or 'Le Hul,' whose trade recerds go back to as early as the year 1193 The forerunner of the original bor of H was the manor of Myton, to g the with the afor and hand tof Wyke, both of which were put of the eccles pars of the sle and N Lerib Hest Thes, except to the portion in the par of N ex cpt to the porten in the par of N (111b), were acquired by degrees from 1100 to 1180 by the Cistercian monks of Means Abbey in Holderness, who cultivated the lands and built themselves a grange in Myton on the site now eccepted by the Railway Dock their settloment being known as Wyke In 1270 the monks wer grunted the right to hold a mixt and a fur in Wyke, the fair later becoming it I in, one of the best known of the old Fing trade fairs. Wyke was acquired by king I dward I in 1293 and its uame was changed to Kingston upon H. It was granted its first Charter (1299), making the trade face bor From its earliest days Wyke was a port with a flourishing export Wike was a port with a flourishing export trid in wool and in imports of continental wines and merchandise Later, it- strategic importance is the key to the its stritight importance is the key to the Mullands, was recognised. New quays were built, the internal communications where built, the internal communications shore of the Humber was estab, and in 1372 the transported and fortified. The progress of the transition and its tade evidently justified the confidence of I lward I. During the reign of Edward III. William de la Pole the first mayor of H. was the most influential king's fire and largely financed. of it was the most indication languaged the carlier campaigns of the Handred Years' war. The collegate church of Wingfuld with its De la Pole chantry church, remains a permanent memorial of the Del Role with the manufacture. though the Carthusian Priory in H was their prin, burial place Flirabeth Plan tagenet, sister of Fdward IV, was the last of the family to hold the manor and the file.

Huisean Lectures, founded by John Huise (1708-90), an kng divine Huise graduated at St John's College, Cambridge, in 1724, and took orders, but in 1713 he came into his father's property in Cheshire, to which he retired, and on his death he left the property to Cambridge Univ to maintain two divinity scholars at £30 a year each at his old

whose main object is to lessen as far as possible the physical pain and discomfort in the world of to-day, and who hold strong views with regard to modern war-

fare, corporal punishment, etc. In this modern sense, the Humanitarian League, founded by H. S. Salt, aimed at

League, founded by H. S. Salt, almed at consolidating philanthropic and zoophilist sentiments and ideas into a 'humanitarian system of othics.' See H. S. Salt (d. 1937) Seventy years among sevages, 1921; The Logic of Vepetarianism, 1933; H. Moore, The Universal Declaration of. This, the first international Bill of Rights in human hist., drawn up after two-and-a-half years detailed study, was adopted by the plenary session of the Goneral Assembly of the United Nations on Dec. 10 by forty-eight votes to nil, with eight abstentions (The Soviet Union, Poland, Czechoslovakia, Yugoslavia, the with eight abstentions (The Soviet Union, Poland, Czechoslovakia, Yugoslavia, the Ukraine, Byelorussia, S. Africa, and Saudi Arabia). The Social and Humanitarian Committee approved the final druft on Dec. 7 by twenty-nine votes against the six of the Slav bloc with Canada abstaining on the grounds that social legislation in Canada was for the prov. govs. and not for the Federal Gov. Canada, boursyes voted in favour of the Indulgrahowever, voted in favour of the Declara-tion in the plenary season. The Pre-amble relates the declaration by implication, to the disregard and contempt for human rights manifested in the Second World War by barbarous acts which 'outraged the conscience of monkind' and assumes that, 'if man is not to be compelled to have recourse to rebellion against tyranny and oppression, human rights should be protected by the rule of rights should be protected by the rule or law; and it goes on to relate the declaration also to the realilmention by the peoples of the United Nations in their Charter (q.v.) of their 'faith in fundamental human rights, and in the equal rights of men and women,' and to their determination 'to promote social progress and butter etendards of the interpret and better standards of life in larger freedom.' The Preamble is followed by freedom. thereford. The Freamole is inflowed by thirty-one Articles setting out the rights in detail. These rights are those which are commonly associated with the way of life of a modern W. democracy and to be found embodied to a greater or lesser extent in the provisions of a free democratic acceptance of the decisions of a free democratic acceptance of the decisions of the decision of the deci cratic constitution or in the decisions of the courts. They may be said also to be a sequel to the declaration of peace aims in the Atlantic Charter (q.n.), particularly that Article of the Charter which emphasises the right of all men to live out their lives in freedom from four and want. Among the rights enumerated are: that all human brings are born free and equal in dignity and rights—a re-echo of the famous assertion in the Amer. Constitution; the right to life, liberty, and security of the person; equality before the law; freedom from arbitrary arrest, detention or exile; trial by independent and impartial tribunals; the right of everyone charged with a penal offence to be presumed inno-cent until proved guilty—a long-estab. principle of the Eng. common law; free-dom from arbitrary interference with a

person's privacy, family, home, or correspondence—by implication a condemnation of notorious practices of the Gestapo; freedom of movement and residence within the borders of one's State; the right to a nationality (many of the 'dis-placed persons' were 'stateless' as also were and are many women who marry allens) and to change one's nationality: the right to marry and found a family; marriage to be entered into only with the free and full consent of the intending spouses, the right to own property alone or in association with others (a right hardly to be reconciled with a communist economy); the right to freedom of thought, conscience, and religion, and of freedom of opinion and expression; freedom of peaceful assembly and association—also a familiar principle of the Eng. common law: the right to take part in the gov. of one's country, directly of through freely-chosen representatives; universal and equal suffrage by secret you; the right to social security, the right to work. to free choice of employment, to just and to ree choice of eliphoyment, to just and favourable conditions of work, and to protection against uncomployment; to equal pay for equal work, to form and to join trade unions; the right to rest and leisure, and to an adequate standard of living. In the nature of things these rights are guaranteed by no legal sametions; but the Presumble proceedings the tions; but the Preamble proclaims the Declaration to be a common standard of achievement for all nations, to the end that every individual and organ of society shall strive by teaching and education to promote respect for these rights and freedoms and by progressive measures, national and international, to secure their universal and effective recognition and observance, both among the peoples of Member States (of the United Nations) themselves and among the peoples of ters, under their jurisdiction.' The prin-ciple of collective responsibility for the maintenance of human rights and fundamental liberties was accepted (Aug. 22, 1949) by 11 votes to 5 in the legal Committee of the Consultative Assembly of the Council of Europe, which met at Strasburg.

Hume, Allan Octavian (1829 1912), Father of the Indian National Congression of Joseph H., a doctor of the E. India (Company, Ha. 2022) son of Joseph H., a doctor of the E. India Company. He was educated at the E. India Company. He was educated at the E. India College (now Hallevbury College), passing from there to the Indian ('1vil Service (1849). In Simla he formed an organisation which would further the aspirations of advanced Indians; this was the birth of the National Congress (see his Audi Alteram Partem). When H. returned to England in 1894 he took great interest in the Brit. Committee of the Indian Congress. In India H. made a valuable collection of botanical and ornithological specimens, and pub. The Game Birds of India, Burma, and Cepton (1879-81). He presented his collection to the Brit. Museum of Natural Hist. (S. Kensington). He founded the S. London Botanical Museum and made prevision Botanical Museum and made provision for it in perpetuity. See studies by W. Wedderburn. 1913, and H. V. Lovett, in History of the Indian Nationalist Morement. 1920.

Hume, David (1711-76), Scottish philosopher and historian, was intended for the Bar, but abandoned the intention of becoming a lawyer owing to ill-health. He went to France in 1731 to recuperate, and there wrote his Treatise on Human Nature, which was pub. anonymously in 1739, two years after his return. This book which was pub. anonymously in 1739, two years after his return. This book attracted little attention at the time, but a better fate attended hrs Essays Moral and Political (1741-42), and his subsequent works, Philosophical Essays on Human Understanding (1743), the famous Enquiry concerning the Principals of Morals (1751), and his Publical Discourse (1752). He had failed in 1745 to secure the professorship of chiles at Edinburgh Univ., and later his application for the chair of logic at Glasgow Univ. was not successful; but in 1752 he was appointed keeper of the Advocate's Library at Edinburgh and also secretary to the Edinburgh Philosophical Society, which latter post he resigned five years later. He now worked stendilly at his hist., which was pub. two vols at a time, between 1754 and 1761. In 1763 he went to Paris with Lord Hertford, and held an official post at the cubassy, and became a to Paris with Lord Hertford, and held an official post at the embassy, and became a noted and popular figure in the society of the cap. The last years of his life were spent at Edinburgh. His autoliography, My Oun Life, was pub. two years after his death, and his Correspondence (ed. Birkbeck Hill) in 1888. Other posthumous works were Suicide and Immertality (1771) and Distress on Natural Palings.

metaphysicians in this or any other country. His hist, suffers severely from inadequate research, and is best studied in the abbreviated version, ed. by Dr. Wm. Smith, 1870. The force of H.'s philosophy lies in the fact that he carries the empirical and sensationalistic tendoncies of Locke and Borkeloy to their conclusion. The psychology on which his results are founded follows that of his predecessors but is less ambiguous. Every object whatsoover is reduced of ther to an impression or an idea-ideas evidently corresponding cheels to impressions but differing in the degree force or vivacity. For H. impressions and ideas, whether simple or complex, are the sole contents of the human mind, all of them going back originally to impressions Hence, as Berkeley said, there can be no such thing as material substance, and reality is co-extensive with ideas. Berkeley held, however, that we could know spiritual substance as opposed to material; but H. asks what, indeed, is the positive impression on which the idea the positive inpression on which the idea of spirit is founded, and he held that neither had any existence. It said that, if all his perceptions were removed by death and could he neither think, nor feel, nor see, nor love, nor hate after the dissolution of his body, he would be entirely annihilated, nor did he conceive what was further equility to make him a prefect further requisite to make him a perfect nonentity—in short H.'s scepticism can imagine no life after this annihilation of the perceptions (we may not say of the self because H. denies the validity of the notion 'self'). H., hower, holds that there are certain all-pervading relations, outside the relation to a self, which seem to bind our ideas to form what we call knowledge. The most important of these relations is that of cause and effect, but that it is necessary to examine whother such relations correspond to definite impressions. Berkeley thought that he had found a basis for the reality of causation in the free activity of Spirit H. however asks for the corresponding impression and seeks the derivation of the relation of cause-and-offect from some relation among objects themselves as distind from any particular qualities in those objects; and he finds such relation in the two concepts of contiguity and succession. These, however, do not exhaust causation; for an idea may be con-tiguous and prior to another without being regarded as its cause. Something of the first importance remains to be added and that is the idea of necessary connection. that is the idea of necessary connection. To the question, for what reason do we pronounce it necessary that everything whose existence has a beginning should also have a cause. If, denies that the necessity exists and that every demonstration which may be produced for the necessity of a cause is fallacious and sophistical. To the question, why do we conclude that such particular causes must mong works were Suicide and Immeriatury sophistical. To his quantum, way as not (1777), and Dialogues on Natural Belligion conclude that such particular causes must (1779). The value of his philosophical writings has never been questioned, although at one time his scepticism made though at one time his scepticism made we draw from the one question to the him notorious among the orthodox, and the takes his place as one of the leading the belief in the necessity of a cause is not referable to any intuitive truth, it must proceed from observation and experience. And here, he says, we insensibly light upon a new relation between cause and effect, that is, their constant conjunction or, in other words, contiguity and succession are not sufficient to make us pronunce any two objects to be cause and effect, unless we perceive that these two enect, these we preserved in sev. instances, an inquiry which will enable us to discover the essential nature of the idea of necessary connection. H. arrives at the conclusion that the peculiar strength of our belief in casual inference is due to the our benefit in casual interence is and to the fact that, by constant conjunction, the relation of cause and effect has acquired the force of oustom, or habit. What we call power, or force, or casual efficiency, says II., exists not at all in objects, but only in the mind. 'Necessity is something that exists in the mind, not in objects; nor is it possible for us ever to form the most distant deat of it, considered as a quality in boars. This is his chief con-tribution to philosophy; he admits that it is a violent paradox but considered that he had advanced solid proof and reasoning to justify it. From this hypothesis, he goes on to consider the origin of a belief in the external world or to answer the question, How out of a flux of unrelated feelings, never repeated, do no evolve an feelings, flever topicati, c' we evolve an independent world or identical things, and identical selves?' And suggests that we have only succeeded in reasoning ourselves 'into a frame of mind where the solid fabric of the world dissolves like a dream before our eyes, or passes into a kaloidoscopic unreality of change. But, he asks, is then scepticism the final word of philosophy ! Apparently the result of 11.'s inquiry is not intended to destroy belief (assuming that were possible), but to dispose of the falso assumption of its certain and demonstrable character. () course the forthright nature of H.'s concourse the forthight mature of 11.8 conclusions was itself the promise of a new epoch, and the first attack on his scepticism came from the so-called Scottish school of Reid, Dugald Stewart, and Sn' Wm. Hamilton, though the merits of Reid have tended to be obscured in the control of the latest at the second s Win. Hattinton, brough the herris in Reid have tended to be obscured in the greater light of Kant. See lives by T. H. Huxley, 1879; W. Kingth, 1888; T. H. Grose and T. H. Green, 1898; C. J. Humerus, in physiology a term denoting the bone of the upper arm; or, in quad-

rupeds, the upper fore-log.

Humidity, of the atmosphere, refers to the amount of moisture that it contains. It is high or low according as the air is damp or dry. The amount of moisture in the air at any given time has a great bearing on weather conditions. The amount of varies in different localities, and is never constant even in any one place; and temp., pressure, wind, and sunshine are all affected according as the II. is high or low. The warmth of the body and breathing even depend upon H. Thus when the air is dry much more water vapour is expelled with each respiration than when the II. is high. Cold and heat are much more easily resisted in places of low II. than in places where the air is damp. (For methods of finding the absolute and retaitive II. see Hygrometress.) When the air is fully saturated with moisture, the relative II. would be 100, and thus is seldom reached in practice except in fore or mists. Sea air naturally has a high II., over 90 per cent, but land air, particularly in dry winter weather, may be as low as 50 per cent., or even, over 40 per cent., 20 per cent., or even, over 40 per cent. Isles varies from 30 to over 80 per cent. Isles varies from 30 to over 80 per cent., Johann Nepomuk (1778-1837),

Hummel, Johann Nepomuk (1778-1837), Austrian pianist and composer, b. at Pressburg. He was a pupil of Mozart and started with him. At the age of ten he started on a concert tour through Europe, and returned to Vienna (1795) to study

J. N. HUMMEL

under Albrechtsberger and Salieri. In 1801 he succeeded Haydn as kapellmeister to l'ence Esterhazy; in 1816 he was appointed musical director at Stuttgart, and in 1820 he illed the same position at Weinar, where he d. He conducted operas in the chief cities of England, Russia, France, and Holland. His chief works are sonatas and études for the piano. See W. Meyer, Johann Nepomuk Hummel als Klavier Komponist (Kiel),

sonales de Johann Nepomuk Hummel, 1933.

Humming-bird Moth, see HAWK MOTH. Humming-birds are members of the coraciform family Trochilides, and are so called because of the vibrating sound produced by their wings; there are from 400 to 500 species, all of which are confined to America and the W. Indios. Among them are some of the smallest of iving birds, Mellisuga menuma measuring only 2½ in. in length. They are characterised by a long, awl-shaped bill, and a long cleft tongue in the form of a double tube, which can be protruded to a considerable distance and withdrawn again very rapidly; the stermum is greatly developed, forming a suitable base for the strong wing-muscles, which assist the untiring flight; the plumage is generally exquisition colouring, especially in the males, with a brilliant metallic lustre, the effect of which is heightened by the crest, cartufts, and ruffs. The Trochildse are insectivores, and dart from flower to flower in search of food, pausing over the plant with the body suspend d in a vertical position and the wings whirming plant with the body suspend d in a vertical position and the wings whitring continuously, which gives a curiously in-distinct and musty effect to the plumage. Patagona gigas, the largest species, reaches a length of 84 in., and inhabits the Andes from Ecuador to Chili; it is bronze-green, with reddish underparts, and is characterised by the flapping movement of its wings, in place of the usual vibratory movement. Trochilus colubris, in addition to the green-and-white colouring, has a brilliant red throat, with a forked tall of bluish black; T. alexander of N. America has the throat of deep purple. Laphornis nas the throat of deep purple. Liphartes is a beautiful genus, extending from Costa Rica to Mexico: L. ornatus has fawn-coloured tufts with green terminal spoton each side of the neck. Laddysau mirabilis of Peru is one of the most gorgeous species; the upper plumage is a lustrous bronze-green, the under-parts are white, the throat is emerald-green, white, the throat is chief id-green, rimmed with black, and the head and crest are a vivid blue. The female is green, with white below. M. minima, called the bee H. because of its tiny size, is found in Jamaica and San Domingo, and the male is characterised by its dusky throathas a straight beak, 5 in. long, which is more than the length of body and head together. Ithamphomicron, the thurnbills, have the smallest books, that of R. mucrorhywhum, measuring only 1 m. The species of Phaelthornes are sometimes termed the hermits, because of their more sombre green and brown plumage, and also from their habit of frequenting dark woods and forests; they examine the crevices of trees in search of spiders, which form their habitual dict, and, poised in mid-air, the hermit will pass his bill over the under-surface of leaves, swallowing any insects hidden there. The H. will raidly live in captivity, and in the have been carried across the Atlantic alive.

Humpback, see HUNGHBACK.

Humperdinek, Engelbert (1854-1921), Ger. musician, b. at Siegburg. He studied at Paderborn Gymnasdum, Koln Conservatory, and the Royal School of Music, Munich, and from 1880 to 1881 assisted Wagner in the preparations for the production of Parsifal. He taught music in the conservatories of Barcelona and Colorne (1885-88), and acted as musicial adviser to Schott & Sons, pubs. (Mainz), 1888-89. In 1884 his popular choral work Das Gluck rom Edenhall was first sung, and the choral ballade Die Wallfahrl nach Kerlaar in 1987; but it was the appearance of his Hansel und Gretel, a musical mury play, which made him the appearance of his Hansel and Gretel, a musical tarry play, which made him famous. This was followed by Kongskinder (melodrama, 1896), and Dornroschen (1902). He also composed Konigskinder (opera, 1910), The Miraele (Olympia 1912), and Moorish Rhapsody (1893). Humphreys, Mrs. W. Desmond, see

Ruis.

Hanan, prov. of Central China, bounded on the N. by Hupeh on the E. by Kiangsi, on the S. by Kwingsi and Kwangtung, and on the W. by Kwelchow and Szechuen. The prov. is hilly in character, the only plain Iving around Lake Tungting. The N. of the prov. is higher than the S., and among the mis, there is thengshan, one of the five secred mis. (Wuvo) upon which the geleichted thielet of Ni was placed. the celebrated tablet of Yu was placed. The print rive are the Sinngkiang, with a basin of 39,000 sq. m, the Tszekiang, with a basin of 10,000 sq. m, the Yuengkiang, with 35,000 sq. m., and the Ling-kiang, with 80,000 sq. m. The prin-products are tea, hence, cotton, rice, paper, tobacco, and coul, the whole of the paper, toba co, and coil, the whole of the S.E. part of the prov being one vast coal-field 21,700 S1. m. in extent. More than 90 per cent of Chin't's production of anti-mony comes from 11., the ann. output being about 25,000 tons. Mining for woolfram is carried on. The print first, are the cap., Changshan, Sangt'an on the Sangthyur, and Changsface on the Slaugkning, and Changetefu on the since the time of Yuengkiang Taiping rebollion the Hunanese have been noted for their pride and obstinacy in admitting outside control. A considerable amount of lighting took place in this area during the Civil war, particularly during the 1926 campaign. sq. m. Pop. 26,171,000. Arca 79,300

Hunchback, or Humpback, deformed condition of the spinal column. Slight irregularities of the normal curvature of the some may result from various causes. such as malformation of other portions of the body, or even a well estab, habit of the body, or even a were established or walking causing irregular pressure. The presence of a definite hump, however, is generally due to the development of Pott's disease, or tuberculous ulceration of the spine. This disculous ulceration of the spine. This disease is characterised by the lodgment of therete germs in the verlebree, and the concequent disintegration of part of their tissue by discration. In many cases a fall or blow originates the trouble, the structure being weakened and becoming more liable to tubercular infection. If the disease is not checked, the body of sev. vertebre may crumble away, there is a collapse of their structure, and the spine curves sharply inwards, forming a pronounced hump and causing disproportion in the body generally Unfortunately, the early symptoms are often in definite. The child—for the discuss is characteristic of the developing period of chartection of the hoveloping period of the body structure—dors not perhaps feel actual pain in the spine but is easily fatigued and avoids invihing like vigor our action. What I must have are may be agained to induce in our he unatism. The more definite symptoms are an in ability to bend the back in stooping a continued stiffnes in the neck if the trouble be situated in the upper part of the column, and a disposition to turn the whole body instead of the trunk only when looking lackwards for an instant

The trustment when early diagnosis is pos lbic involves complete rest for the spinal column by providing the princip with a carriage in which he can be at full length on his back The apright posture should never be a sumed and the patient should spend as much time as possible in the open in. The period of rest must be prolonged until there is reason to suppose that the disint grated structures have been built up again Suitable splints should be provided to keep the parts quiet Pure air and good food are necessary adjuncts to any use of treat ment. If the disease has run its course for some time without detection and the deformity has actually set in there is little hope of a permanent cure. A certain proportion of cases have responded proportion of cases have responded favourable to operative measures which involve temoving seme of the posterior parts of the vertel ra. This operation, known as lamineetimi is resorted to when

and defence. If it are miny diverse theories to account for the exact origin of r tim all the passessions in France which the term but the most generally accepted to leen hold by henry II, without is that it was at first an association of one exacting homogo. The Fr nobility rehanded persons for purposes of rolice to to rotative these times and kelward and justice. The chief man of the H was again invaded I rance with the result that and justice The chief man of the H was ally had a court called the H moot personal rather than topographical origin of the II - which latter view is disprove I by the inequality in size of the different Hs —seems to be confirmed by the now obsolote action against the H in case of any loss by robbers the object of which according to Blackstone, was to make the H answer for the robbery unless it succeeded in capturing the felon. The term H still exists, but is now of no significance The term for any local governmental purposes, though under an old statute the H or any corresponding dis, is still lishle in certain cheumstances for damage caused by riot. The H as an equies div is now replaced by the deanery, and the H rate by the co-rate See under Highways as to repair of H. bridges.

Hundred Years' War, between England and France, 1338-1454, was begun by Edward III of England attempting to Fdward III of England attempting to enforce his claims to the Fr throne and ended by the loss to England of all her Fr conquests except (alare In 1328 (harles IV of liance d leaving no male issue, and Edward then claimed the throne in right of his mother is shella, sister of (his less But by the Salic law women vere excluded from the Fr throne, I dward a retort was that his mother could it insuit the right to him, an argument which would in any event, have ment with would in any event, have given a better claim to Charles of Navarre. The kracers actually to acknowledge have a larger Philip of Valois as their king and I dwird then submitted and did homage to Philip for Guienne, which belonged to the Ing Crown But when I hill est oused the cause of David II of scotland against I dward, the latter renewed his claim to the Fr crown assumed the title of king of France, made assumed the title of king of krance, made alliances and prepared for war, hostilities commencing as throughout list, from the cite of Planders The clust events in the period from 1339 to 1300 were the detect of the kr fleet oft Suya (1349) the compaign in Brittany (1342) the battle of (100) (1316) and, in the same year the beginning of the siege of (alais Manuschiel bayed had invaded include Meanwhile David had invaded Ingland as the illy of krance, but was heavily defeated by Queen Philippa's army it Neville 8 (toss (October 12 1346) 131 famine compelled (alus to surrender to I dwud and a truce was made with brance which was further prolonged by the Block Death In 13>> the war was renewed as terrely as before Philip had puts of the veiteles. This operation, and we as hereely as before. Philip had known as lammeet misers or to the when there are indications that the curvature four this kingdom torn with factions has caused sense compression of the spinal cord. Hundred, one of the most anct subdives of a shire and good to the pages of the million of a number of coverships for the purpose of judicial idministration, peace if the pages of the pages of the pages of the purpose of judicial idministration, peace if 1 is 13 0) the capture there of king and the pages of pade in the pages of the pages of pudicial idministration, peace in the pages of pages of pages of pages of the pages of pudicial idministration, peace in the pages of pages of pages of the pages of pages of the pages of p leln and the latter a signed promise to fre h negotiations were set afoot and the treaty of Bretigny r the Great Prace, signed in which Edward renounced all clum to the ir cown and to the ir vs of Normand Maine, Anjou and I maine, but received in return without thenion of hon az the prove of Pouton, then not hon az the prove of Pouton, then not, and the trof Calase together with throe million and crowns as a ransom to king John (May 8, 1360) War was ter king John (May 5, 1300) War was ten wed, however in 1367, owing to the Black I rine's attempt to tax the Gas-cens The latter at peaked to John's suc cesor, Charles of Lunco, who summoned the Prince to Laris and as this summons was contrary to the Treaty, the Prince started thither at the head of a large army. But failing houlth ompelled him to relin-quish his command, and thereafter France gradually won buck all the possessions,

only Bordeaux, Bayonne, and Calais remaining to the Eng. crown (1376). The war dragged on, however, through the reign of Richard II., who got into dilliculties over his poli tax to meet its expenses. Richard was unlit both as general penses. Archard was unit both as general and administrator, and when heatilities were renewed in earnest it was at the initiation of the Fr. king, who demanded from Henry IV. of England the dowry and jewels of the widowed Isabella, which Henry retained as part of John's ransom. There was no open declaration of war, but a kind of piratical warfare was carried but a kind of piratical warfare was carried on at sea, and eventually, through the dissensions between the houses of Orleans and Burgundy and the imbedility of the Fr. King Charles, England won back the sovereignty of Aquitaine, Poitou and Angouleme (1412). The distracted state of France at this time gave every encouragement to the ambitious Henry V., who demanded the restoration of all the possessions held in France by King John, the hand of Charles's daughter in marriage, and a dowry of two million crowns. The answer being evasive, Henry Invaded The answer being evasive, Henry invaded France and won the battle of Agincourt (Oct. 25, 1415), returned to England and renewed the invasion in 1417, with a larger army than before. The Burgundians having thrown in their lot with him, owing to the murder of the duke of Burgundy by the rival faction, the Fr. Gov. had no option but to acquiesce in all Henry's demands, and the treaty of Troyes was signed in 1420, recognising Henry as regent, with the right to succeed to the Fr. throne on the death of Charles. The premature death of Henry V., however, followed by the accession of the infant followed by the accession of the infant Henry VI, upset all these schemes, and though the infant Henry was duly pro-claimed king of France, the late dauphin assumed the title of Charles VII. Charles VI. having died soon after the late Eng. Vir. navmit the sound after the face Engling asserted his claims. At Crovent, in 1423, and Verneull, in 1424, the dauphin met with crushing defeats and was forced to retire across the Loire. In 1428 the to retire across the Loire. In 1428 the regent, Bedford, planned to cross the riv. and marched into those provs. in the S. which adhered to the cause of Charles. The next great event was the battle of Herrings, fought while Bedford was besieging Orleans as the key to the S. (1429). The defeat sustained by the Fr. so discouraged them that Charles was on the point of giving up the contest altogether and leaving the country when the whole and leaving the country when the whole face of thing; was changed by the advent of Joan of Δrc . After the coronation of of Joan of Arc. After the coronation of Charles VII. and the burning of the Maid of Orleans the Eng. cause in France rapidly waned. The duke of Bedford rapidity waned. The duke of Bedford quarrelied with the powerful duke of Burgundy and then tried to reconcile his affairs with the Fr. Court, and in 1145 he signed a treaty of friendship with Charles at Arras. Bodford d. in the same year, and before the new regent had reached France, Paris fell into the hands of the Fr. king and in 1144 the Eng. were glad to make a truce for two years. On its expiration Fr. troops overwhelmed Normandy through Maine and Anjon, and Burgundy and then tried to reconcile his affairs with the Fr. Court, and in 1435 he signed a treaty of friendship with Charles at Arras. Bedford d. in the same year, Joseph (8736 ft.), and in the S. Negoi and before the new regent had reached (6813 ft.). Sev. peaks range between France, Paris fell into the hands of the France, Paris fell into the hands of the 5000 and 7000 ft. Those of the High Fr. king and in 1144 the Eng. were glad to make a truce for two years. On its hills on the S. side, there reveal their full expiration Fr. troops overwhelmed Normandy through Maine and Anjou, and

then, turning S., captured Guienne, and by 1451 Calais alone remained to the Eng. by 1451 Calais alone remained to the Eng. and the longdrawn war was at an end. See F. Huneker, James Gibbons (1860-1921),

Huneker, James Gibbons (1860-1921), Amer. musical critic, b. at Philadelphia. For long he was musical critic of the New Vork Sun. Among his works are Icono-clasts: a Rook of Dramatists (1905), Visionarics: Fantasies and Fiction class: a Book of Dramatists (1905), Visionaries: Fantasies and Fection (1905), Egorsts: a Book of Supermen (1909), Frunz Liest: a Study (1911), The Pathos of Distance (1913), Old Fogry, His Musical Opinims and Grolesques (1913), New Cosmopoles (1915), Baudelaire (1919), Manufach bbb. propriet (1915) Steeplejack (his memoirs, 1921). See Josephine Huneker (od.) John Gibbons Hunter, Intimate Letters, 1937.

Hungary (Magyarország), republic of Central Europe (pop. 9,316,600) lying between the Alpa and the Carpathians and including parts of the basin of the middle Danube. Its area is 35,903 sq. m. and it lianue. Its area is 3,300 sq. in, and at is an entirely landlocked country. The cap, is lindapest. It is one of the succession states of the old Austro-Hungarian Dual Monarchy. The anet. kingdom of H. always took high rank among the states of Europe in respect of ter. and pop. Although its armed forces, with the exarmough us armed proces, who the ex-ception of the Honveds, were formerly united with Austria, yet II. remained an independent state, the head of which was His Majesty Francis Joseph, the apostolic king. By unanimous vote of the National Augustic III. Assembly H. was reconstituted a kingdom Assembly 11. was reconstituted a kingdom in 1920 after having been declared a republic on Nov. 17, 1918. Following the surrender at the end of the Second World War of the Axis powers II. was occupied by the Allied Control Commission. self-gov. was, nominally, re-estab. in 1914, and after a general election a republic was again declared (Feb. 1, 1946) with a constitutional President and a cabinet. Though constitutionally a kingdom between 1920 and 1946, the throne remained vacant throughout this period, the question of the Hapes. the question of the return of the Haps-buigs having been left unsettled.

II. has almost in the contre of Europe, and before the First World War had a well-defined frontier formed on the N., N.E., and E. by the Carpathiaus, and on the S. by the rivs. Danube and Save. The whole country was in the form of an ellipse, from which a neck of land extends to the Adriatic. The Carpathians scarcely

In the gently undulating part of the country which extends along the r b of the Danube are found H s largest lakes, the Balaton and the Feibo, only half of which now belongs to H. The former is 47 m long, with an area of 266 sq m, and contains abundance of fish, the largest and most remarkable of which is that known as the fogas In addition to the Danube, the print rivs of H are the

Nature has been very bountiful to H. in respect of minerals. From the Bronze Age onwards these have been dug and smelted. In later periods the Roms, did much mining in the country, and derived from it their chief supply of gold. Gold and silver mines are worked by the State. and silver mines are worked by the State. Coal is very abundant, but much of it is of rather inferior quality. The better quality coal is mined in the Messek Mt. in the dist. of Pécs. Nearly 14 million tons of coal and lignite were produced in tons or coal and lightle were produced in 1941. A plentiful supply of iron-ore keeps sev. large smelting works fully occupied. Copper, lead, antimony, and zinc are also found. Bauxite deposits yield half a million tons in a year. H. possesses the only opal mine in Europe. Enormous quantities of rock-salt exist in E. H. Having been worked for many centuries, some of the salt mines include subterranean excavations of great extent. The sait industry is a monopoly of the State. Asphalt and petroleum are also found. The discovery of the ollibel of Lispo in 1937 increased the output of oil from 300 tons (Jan.-June 1937) to 750,000 tons in 1913. But the most remarkable treasure is natural gas, which remarkable treasure is natural kas, when during recent years has been found by deep borings in many parts of the country. These Hungarian gas wolls are equal in extent and value to those of Pittsburg and other places in America. Mineral waters of various kinds, both hot and cold, spring forth plentifully in many parts, and are found to be very efficacious in the treatment of disease. At Rankhirlany, near Kassa, a geyser may frequently be seen uplifting a great column of water. Before the Second World War the most famous baths were those of Budapest, Trenscenteplitz, Vizakna, the Baths of Hercules, and Postyen. At the last-named place radio-active and may be successfully used in the treatment of rheumatism and allied disorders.

Education is compulsory from 6-15. There are some 8000 elementary schools with a million pupils. There are also middle and continuation schools, and six state universities with over 8000 students (1940). Religious toleration is stated to (1940). Religious toleration is stated to be one of the fundamental principles of the Hungarian State. Some two-thirds of the Mayyars are Rom. Catholics, while the remainder are mostly Calvinist.

The div. of the pop. according to language is approx.: Hungarian (Magyar) 81-4 per cent. Ruthenian 10-1 per cent. Germans (prior to their expulsion in 1945) 4 per cent. with small proportions of

8 per cent, with small proportions of Slovaks, Croats, Rumanians, Serbs and others. The pop. of Budapest in 1938 of Nikopolis, but the discrace was soon was 1,059,000. Other large cities are blotted out by the triumphant victories Szeged (140,000), Debreczen (127,000), of the soldier-patriot, John Hunyadi.

flour. Other important products are maize, barley, oats, rye, and other cereals, as well as tobacco. Vineyards occupy about 600,000 ac. Melons and other choice fruits are raised in great abundance. Between three quarters of a million to one million fruit-bearing trees have been planted on the sides of the high-roads. Much red pepper, known as paprika, is grown in some cos.

Nagyvarad (84,000), Miskole (75,000), Vipest (74,000), Pestszeuterzsbet (73,000), Pestszeuterzsbet (73,000), Pestszeuterzsbet (73,000), Pestszeuterzsbet (73,000), Pestszeuterzsbet (73,000), Pestszeuterzsbet (73,000), Miskole (75,000), Vipest (74,000), Miskole (75,000), Vipest (74,000), Pestszeuterzsbet (73,000), Pests the twelfth contury and received extensive grants of land, which, having been rotained as common property, has greatly contributed to the very remarkable pro-perity of these communities. Saxons, like all the other subnationalities in H., have retained their own language, re-ligion, and customs. The pastures of H. support a vast number of useful animals. The census of such in 1938 showed that there were \$13,000 horses, 1,882,000 cattle, 1,029,000 sheep and 3,110,000 pigs, History.—II. was founded about the

year 889 by the then savage Magyars and Ungri, who were pressing westwards across the Carpathians. St. Stephen (1997-1038) instituted the monarchy. It was he, too, who did all he could to encourage his people to embrace Christ-anity; for he estab, an eccles, polity, and endowed the infant Church by founding many bishoprics and abbeys. His countrymen cherish his name because of the refining influence his humanity exercised over their untamed and warlike ancestors, and because of the stimulus his practical good sense gave to mining and other peaceful industries. At this time the king only exercised his authority directly over certain privileged tas, and the royal demesnes; nobility and Church were largely self-governing, whilst the nation at large was, for the most part, at the mercy of the landowners. We may here notice the 'Golden Bull,' which King Andrew II. conceded in 1222 to his barons: by this charter he recognised their right to take up arms against the sovereign should be be guilty of any grave infringement of their privileges and guaranteed that the Diet should be summoned annually.

The bulk of this brief sketch will be occupied with an account of the wars with Turkey and of the relationship of II. with the sister kingdom of Austria. The Hungarians first wagod war against the Saxon kings, Henry the Fowler and Otto the Great, who gained a great victory over them in 954, and from 1241 onwards they were busily engaged in repelling the persistent advances of the Mongols or Tartars. It was under Louis the Great (1342-82) that they first gained a signal victory over the Turks by the banks of the Maritza.
This Louis was king also of Poland, and
the importance of such a victory will be
appreciated when it is remembered that it. and Poland were the natural bulwarks against Mohammedan aggression on W. Christendom. In 1396 the Sultan Bajazet defeated Siegmund of II. at the battle Panic among the latter's troops, due to the king's death, accounts for the defeat of the Hungarians at Varna (1414), but in 1456, a few months before his death, Hunyadi succeeded in raising the siege of Belgrade and scattering a formidable Ottoman host.

H. reached the summit of her glory under Matthias Corvinus (1158-90), the son of Hunyadi. His successors were weak, and the country, therefore, fell an easy proy to the Turkish invaders. In 1526 these latter, under the leadership of Sultan Suleyman, who had already captured Shabatz and Belgrade, over-whelmed the Hungarian; at the battle of Mohacs and slow their king, Louis II. Buda, the cap., was taken, and the splendid library of Matthias wantonly destroyed. Until the Peace of Carlowitz (1699), which concluded a bitter struggle between Austria and the Porte, the greater part of H. remained in Turkish hands, and a Turkish pasha presided in Buda. By that peace the Ottomans were obliged to yield most of their Hungarian conquests, but it was not till 1716, when Prince Eugeno defeated them, that II. thaily became independent of their swav. Siegnund, who was "ive of II. from 1392 to 1437, and who was chowned emperor of the Holy Rom, empire in 1433, is the first link between the crowns of H. and Austria. After Louis's death (1526), to which reference has already been made, the sovereignty of his kingdom was conferred on Ferdinand, archduke of Austria, who was elected emperor in 1558. Thenceforward it remained with the Austrian archdukes: until 1687 it was elective, but in that year it was made hereditary in the

Hapsburg family.
It must not be thought that H. submitted to Austrian rule without a struggle. The resentment naturally rising from the the resentment inturnally rising from the loss of a nutional king was aggravated by the folly of many of the emperors. Thus Leopold I. (1657-1705), in his ruthless attempt to re-eatholicise the kingdom, was responsible for the wholesale massacre of Protestants and for their alliance in self-defence with their hereditary foes, the Turks; and Joseph 11. (1780-90) com-mitted a fatal error in endeavouring to ride rough-shod over all their most time-hallowed institutions. The year of revohallowed institutions. The June of intense patriotism. The Hungarians, intense patriotism. The Hungarians, under the famous Kossuth, Deak, and others, made a desperate attempt to re-gain their former independence, A new constitution was promulgated, and for a time Kossuth was acknowledged as su-Preme governor. But in the end the Austrians, who had summoned the Russians to their aid, prevailed, and the Russians to near and, provened, and the old despotic régime was resumed. It was not until 1807 that the dual monarchy was consolidated and francis Joseph, emperor of Austria, was crowned king of H. Foreign affairs, the army, and finance were controlled by the Delegations —a body composed equally of Austrian and Hungarian deputies. Otherwise the two nations were distinct, and had their own parliament, executive, and laws.

For II. during the First World War, see AUSTRI4-HUNGARY. On Oct. 3, 1918, a revolution broke out in H. with the aim of establishing a Republic. The revolution was successful and on Nov. 16, 1918, H. was proclaimed an independent Republic. Count Michael Karolyi was chosen as President, and the Republic was known as the Hungarian Peoples' Re-public. The two Houses of the legislature were abolished, and a Provisional National Council was set up. But in March 1919 there was a second revolution under Bela Kun, who was financed by Russia. This Kun, who was financed by Russia. This resulted in a soviet gov. loing set up with a dictatorship of the proletariat. When the Republic was proclaimed in 1918 under the presidency of Count Karolyi, there seemed, to the outside world, some prospect of H. settling down to a con-stitutional form of gov. This was the moment that might have been seized by the Entente powers to prevent discontent and disruption. The moment was missed in the all-absorbing concentration on peace with Germany, with the result that Rurama, Yugoslavia and Czechoslovakia -all with more or less conflicting interests —all with more or less conflicting interests —pronticed by the policy of drift to carve up pertions of H. in detiance of the Wisoman principle of self-determination. This naturally grouped the fiercest passions in H. and the people as a whole were ready to follow any party in the country which might offer a plausible remady. It was always the intention of certain members of the Karolyi administration to ignore Constitutional methods. stration to ignore Constitutional methods and sooner or later declare openly for the Bolshevik régime of Lenin and Trotsky. With the Hungaran masses chains, in the spring of 1919, under the prospect of total national ruin, this Mana or clique, trained in Russian methods and financed by Russia, deluded the Hungarians into the belief that these imported doctrines were the sole panacea to the existing chaos. Rumania invaded II. and expelled Bela Kuu, and, after a short socialist régime, the kinscom was short Socialist regime, the kingtoin was restored in 1920 under Admira! Horthy (q.r.) as regent. Two attempts at re-storing the ex-king Karl in 1921 proved abortive.

The revision of the treaty of Trianon, by which in 1920 H. lost three-fifths of her former ter, and two-thirds of her pop., became thenceforth the head and treat of Hungarian policy. This Hungarian irredentism anned at more than the mere recovery of geographical areas, for together with the lost ters, went also a great part of the estates on which the power of the ruling aristocracy was founded. Without such a recovery H. could never aspire to a dominent position in the Danubian Basin nor assume the position of bulwark of the W. against the position of bulwark of the W. against the E. an aspiration particularly of the Magyars who regard the peoples E. and S. of Vienna as their cultural and racial inferiors. Mussolini openly sympathised with these aspirations because they seemed to involve the disruption of Yugoslavia, an aim common to Italy and H. The Rome Protocols signed in 1934 between

Italy, II., and Austria offered a show of resistance to the pascent menace of Hitlerite Germany, but even bofore the Ger, annexation of Austria had brought Germany into contiguity with Italy and II., both those countries had decided to compromise with their formidable neighbour in the hope that together they as Count Teleki, the Prime Minister, had stept a guern strong enough to secure compilited suicide circle in the resistance. neighbour in the hope that together they might appear strong enough to secure some advantages. But the theoretically 'nutual' expansionist aims of Nazi Germany, Fascist Italy, and Horthy's H. were, in practice, certain to clash, though for some time Horthy thought Germany would be too preocupled with exploiting her territorial gains to become involved in S.E. Europe. When this illusion was dispelled H. proclaimed her entry into the war against Russia as inspired by crusading motives suggested by the anti-Comintern Pact and divorced from any territorial ambitions. It was hoped in H. that their contribution to the invasion of Russia would be restricted to air reconsissance and garrison duty; but the of Russis would be restricted to air reconnaissance and garrison duty; but the Vornnezh disnater (see under Eastren Front in Second World Ward of Nov. 1942 altered the aspect of the war in the E. Soon two-thirds of the Hungarian Army—an army built up with the connivance of Hitler in definace of the Trianon Treaty—was destroyed on the battlefields of the E.; 'mutual' aid, with Germany, indeed meant that Germany always got the best of the burgain. It is true that for her complicity in the dismemberment of Czechoslovakia H. secured a common frontier with Poland; yet, having seen Poland destroyed in 1939, H. in 1940 assisted the Ger. conquest of Rumania by accepting N. Trausylvania. H. thus offered to the world an abject H. thus offered to the world an abject spootacle of period and fear. The country which had stabbed Czecho-stovakia, Poland, and Itumania in the back was now to stab Yugoslavia. There were, at this time, some ten thousand men in H. who affected aristocratic descent. in II. who affected aristocratic descent. They ruled or tried to rule the remaining thirteen millions. A majority of them regarded Hitler and his methods with acute distaste. Many of them went to gaol for the frankness of their opinions. The minority, who favoured Hitler, eccentries like Festetics who formed the first pseudo-Nazi Party in II., novre carried much weight. Their collapse came easily, not because the peasants and workers of II. were 'pro-ier, or pro-Nazi' (they were so only in the areas inhabited by Gers. to the W. of the banule), but simply because the aristocracy, reinstated simply because the aristocracy, reinstated under Horthy, had smothered every attempt to imbue the Hungarian masses with the spirit of liberal politics or educate them in democratic institutions. Having

occuring so soon after the rathication of the Treaty, explains the frenzied Hun-garian efforts to 'explain' it, especially as Count Teleki, the Prime Minister, had committed suicide eight days prior to the invasion. For Count Teleki was the 'strong' man of H. For over two years following the fall of his predecessor, Imredy, early in 1939, he had danced along the tightrope of non-intervention and non-belligerency, the abyss of a Ger. alliance always yuwning beneath him. alliance always yawning beneath him. Until the fall of France he was successful and H. was committed to nothing more than tacit non-military support of Germany. After the fall of France this attende had to change; and gradually, as indicated above, II. came more and more within the Ger. orbit. Hence, following the suicide of Teleki and the invasion of Yugoslavia, the discredited Hungarian gov. built up the legend of the strong man. Teleki, who had resisted Gernany's demands; though the only possible resistance, in any valid sense, would have been for H. to stand athwart the path of the Ger. Wehrmacht in the manner of the Yugoslavs. Teleki, by taking his own life, merely left the way open to the Wehrmacht and to his successor to continue a policy which he himself had sponsored but whose logical conand H. was committed to nothing more self had sponsored but whose logical consequences he was too cowardly to face. Thus H, had become committed to war Thus it, had become committed to war on Germany's side against the Allies and, after the Brit. failure in Greece, this seemed to be the right side. But with the success of the Med Army, H. began to reconsider her position, especially as the tide of the Russian counter-offensive was meaning to provide the Counter-offensive was sweeping towards the Carpathian lasin, and thereby threatening that portion of Transylvania which Hitler had given to Teleki in exchange for the use of the Hungarian army against the Soviet Gnon. Moreover, the Rumanian army was being decimated at Odessa, and the was being decimated at Odessa, and the more deeply the Rumanians became in-volved, the more feeble, by contrast was H.'s share in building Hitler's New Order (q.v.) in which, as Hitler refterated, each country's status would depend on the extent of its individual positive contribuextent of its individual positive contribu-tion. But the most pressing need, as H.'s rulers saw it, was to preserve the foundations of the regime and the power on which it rested. Hence in July 1943 was issued a decree authorising the minister of the Interior to form armed auxiliary police formations. As Kallay, Teleki's successor, said, 'In II., as in Germany, there must not be another 1918.' But the factor now disturbing the balance was fear of the effect, of military with the spirit of liberal politics or educate them in democratic institutions. Having secured N. Transylvania, H. pad for her bargain by finding herself burdened with a new frontier rebuilt, politically and economically, in such a manner as to be little else than a Ger. lever for putting pressure ulternately on the two victims, H. and Rumania.

The pact of 'eternal friendship' with Yugoslavia signed Doc. 12, 1940, seemed apperficially to denote a change of policy, with sev. different voices and assume various masks; but behind them all was the face of the stubborn, greedy, reway and within two weeks from that time actionary landlords who were the real they had been driven out of H., and with rulers of H.

In Jan. 1944 the increasing rapidity of the Russian advance in the direction of the Carpathians threw Hungarian gov. into great perturbation, and mulisters were now telling the people that they must prepare to defend their frontiers against any enemy, from whatsoever quarter he might come. The Gers, took drastic measures to ensure that II, should not desert the Axis (q.v.). Horthy was ordered by Hitler to a conference at Obersalzburg (March 16) where he was forced to agree to the entry of Ger. troops into H. and to the dismissal of the Kallav gov. When Horthy returned to Budapest gov. When Horthy returned to be some on March 19 he found that Ger. troops on tored the city. The new had already entered the city. The new Hungarian gov. under Sztojay now dis-solved all the liberal or democratic parties as well as associations and clubs not of a clearly fascist character; but the chief offorts of the gov. were devoted to the persecution of the Jews who, in spite of all decrees against them, were still playing a considerable part in the economic life a considerable part in the economic life of the country. Hut, soon the persecutors of the Jews had to the law about the safety of their own skins. The Russians were already in E. H. and making great progress. The defection of Rumanu from the Axis (Aug. 1914) led to a strong movement in H. for conung to terms with the Allica but the approximent that Puesla Allies, but the announcement that Russia had promised Transylvania to Rumania was a sufficient inducement to the Hunwas a suncern inducement to the Bull-garians to continue the war. A few days later Russian and Rumanian troops crossed the Rumanian frontier into II. Between Oct. 8-10 they had crossed the Tisa, taken Szeged and advanced to within 60 m. of Budapest and also taken Debreczen. Upon this, Szalasy, leader of the Nyilas or Arrow Cross organisation or movement (comprising a score of fac-tions of a pro-Nazi or anti-democratic character produced by the short-sighted repressive policy of the aristocratic oligarchy), carried out a coup d'état (Oct. 15) by which Horthy was forced to resign and Szalasy in-talled himself as acting-Regent.

Early in Nov. Pest was under siege by Early in Nov. Pest was under siege by a Russian army, white unother Russian army, advancing up the Danube from the direction of Yugoslavia, reached Lake Balaton on Dec. 5, and soon the Hed Army was closely investing the whole of the cap. Later in the month Gen. Miklos was appointed prender by a Provisional National Assembly to reverse his predocessor's policy. This his provisional gov. did by declaring its readiness to conclude an armistic with Russia and the gov. did by declaring its readiness to con-clude an armstice with Russia and the other countries with which II. was at war and to declare war on Germany. Ger, resistance in Budapost, however, sup-ported by Szalasy's followers, continued till Feb. 13, by which time a largo part of the city had been reduced to ruins. During the ensuing few weeks heavy fighting took place between the Russians and bources of H.'s national wealth were thus the Gers, around Lake Balaton, but about put under direct Soviet control and

then went the Szalasy gov., while that of Miklos now became the effective gov. for the whole of H. (For details of the fursian invasion of Hungary and the siege of Budapost, see under Eastern Front or Budapost, see under Eastern Front or RUSAG-GERMAN CAMPAIGNS IN SECOND WORLD WARD, At MOSCOW (Jan. 20, 1945) the Provisional National Gov. of Miklos concluded an arnistice with the United Nations by which H. undertook to withdraw her troops within the frontiers of II. as they existed at the end of 1937: of II. as they existed at the end of 1937; to pay reparations to Russia, Czecho-slovakia, and Yugoslavia to an amount equivalent to 300,000,000 Amer. dollars; while the Vienna Arbitration Awards of 1938 and 1940 assigning N. Transylvania to H. were declared null and void. Recruiting was begun in Feb. for the eight diva, promised by H. for the war against Germany. In March the gov. brought into operation a Land Reform Bill based on the recommendations of the National on the recommendations of the National on the recommendations of the National Peasant Party, involving confiscation of all large estates. On Aug. 27 a Russo-Hungarian Trade Agreement was signed providing for a reciprocal exchange of Hungarian goods and for extensive Soviet participation in the control of Hungarian industry, production, communications, and banking. The privileges thereby conterred on Russia provoked a protest from Great Britain and America, and the ratification of the agreement was deferred by the Hungarian Assembly. In the new by the Hungarian Assembly. In the new gov. the Smallholders, Communist, and Socialist-Communist 'Parties were all represented, but in the ensuing election headed does not be the Allied Control Commission headed by Marshal Voroshilov, Soviet commander-in-chief, the Smallholders obtained 246 seats against 71 Socialist, 67 Communist, and 22 National Peasant; and Zoitan Tildey, leader of the Smallholders, became Prime Minister. Tildey's coultion row, on Dec. 11 dissolved the conlition gov. on Dec. 11 dissolved the Russo-Hungarian Trading Company for-med after the conclusion of the Trading Agreement mentioned above. Later it issued a decree expelling from H. all Ger. speaking residents, numbering 500,000. in addition to the Gers., numbering about 250,000, previously ordered to leave.

H. lost more than two-thirds of her annotal wealth in the war. She had no cap, to replace the losses suffered in annual stock and arric, machinery. At the same time she had to provide for the feeding of a large Soviet army of the feeding of a large soviet army of the grounding time. occupation. Her communication system occupation. Her communication system was destroyed or dislocated during the fictee battles. Her reparation liabilities compelled her to pay £75,000,000, of which two-thirds were due to Russia and the remaining one-third in equal shares to Cree hoslovakia and Yugoslavia. In fulfilment of the commercial agreement of Aug. 1945 with the Soviet Union joint Soviet-Hungarian companies were founded for the exploitation of Hungarian bauxite deposits and ollifelds. The two greatest sources of H.'s national wealth were thus management. Similar companies were elimination of liberal and social-demo-founded in respect of Hungarian air com- cratic elements and an increasing orientamunications and riv. navigation. Following the Potsdam agreement all shares in Hungarian undertakings which were in Ger. hands were transferred into Soviet possession. This factor placed Russia in possession. The factor placed runsia in 1917, had destroyed the greater part of the position of directing the management of H 's agric. implements, half the cattle and horses, and thron quarters of the sheep. H.'s only hope was that the W. would All are (1949) being replaced. A TRADITIONAL PROCESSION OF VINEYARD WORKERS IN A HUNGARIAN VILLAGE

note of protest to the Russin chairman of the Allied Control Commission for II. against Soviet interference with the non-Communist Gov. of Half accused Russia of unin-titled interference in the internal affairs of H by attempting to substitute a communist dictatorship for the existing freely cie tod gov, and said that the United States was impelled at this time to express its feeling of concern at the political crisis

which has been precipitated in H.'

The Peace treaty of Paris with the Allies was ratified by the H. National Assembly on July 2, 1947 and by President Tildy on Aug. 8, 1947. The Russian occupation troops were then officially and the president of the property of the president o

and continues at remarkable speed Moreever, hospitals equipped in the most modern way, schools, a unit, nurseries, people's college (a revolutionary resi-dential experiment in education at no cost to the 6,000 sons of poor farmers or workers in them) also here and there throughout the country. H is a partly-socialised state and so far about 700 entrprises have been nationalised, while the state of the state more than 3,000 with fewer than 100 emplovers cach remain at present in private hands. The small-holders number about 1,790,000, who have been allotted from five to fifteen a res—the latter figure is for farmers who have gained a diploma. withdrawn. Another general election took place on Aug. 31, 1947 in which the communists gained only 22 3 per cent of the total votes. However, all developments since point to a rising forcible stocked with ten home-manufactured tractors, sprayers, threshing-machines and other apparatus, together with 25 trained workers. By 1949 the State had nationalised the Church-sponsored schools and dispossessed the clergy of 1,000,000 ac., granting the Church only about 27,000 ac. out of H.'s 20,000,000.

In Feb. 1949 the traditional conception of liberty of consequence of the whole W.

In Feb. 1949 the traditional conception of liberty of conscience of the whole W. world was ruthlessly violated by the barbarous trial before a people's court' of Cardinal Josef Mindszonty, archbishop of Esztergom and Prince Primate of H., on charges of disloyalty to the State and 'anti-democratic' activities, followed by conviction and a sentence of life imprisonment and configention of all property ment and confiscation of all property. Six other persons were also charged with six other persons were also charged which similar offences, including Prof. Justin Baranyai, Irince Paul Esterhazy, and Dr. Andras Zakar, the cardinal's private secretary, all of whom were sentenced to varying terms of imprisonment. The specific charges against the cardinal, which included also alleged violation of foreign exchange regulations and smuggling refugers, were, in themselves, no more than instruments of communist policy devised for the purpose of removing those whom it regarded . its enemies. essence the trial was really the manifesta-tion of the great conflict between idealist religion, as expressed in Christianity and embodied in the Rom. Church, and materialism as expressed in communism and embodied in the Soviet inspired gov. of H. The eardinal, son of Suabian peasants from the fervently catholic W. of H., had always treated the communists simply as men who were positive believers in a faith without a God, and more to be opposed and prayed for than negotiated with, and that attitude was reinforced by the intractability of his own character, by his right-wing political opinions, and by the tradition of the catholic lucrarchy in H., which throughout hist, has always supported the authority of an almost feudal state. At the beginning of 1948, when the feud between him and the communists became open battle, the Cardinal munus accame open ontro, the Cardinal refused to give the new communist state any declaration of loyalty except on the conditions of freedom for all Catholic associations—sev. of which had been banned under the anti-Fascist law—and resumption of diplomatic relations with the Vatican. In the minds of the whole people of H. he had become the undeclared leader of a political opposition as well as of a religious faith. The Communists tried to persuade their own people and the world that they were not against religion, but against the cardinal, whom they accused of seeking to restore a thoroughly unjust and discredited society. In theory religious worship in H. was free; religious teaching compulsory in the nationalised schools, and, officially, all children wore bound to attend church. But the new People 8 Colleges were teaching the description of the control of the co ing Marx's doctrine about the rôle of organised religion in hist. The Calvinist Church made its peace with the gov. and negotiated exemption from nationalisation of its lay schools. The cardinal refused between the two tongues. Since his day

to negotiate and therefore none of the catholic lay schools was exempted, and he always forbade the monks and nuns to teach in the State schools. In short, the cardinal's protest was against those dangers to the human spirit which every-where in the E. of Europe were unfolding under communism with the result that persecution began with vilification and ended in the tragic farce of his trial. There never was a chance from the moment of his arrest that the cardinal might be accusted exact for the results. moment of his arrest that the cardinal might be acquitted or set free for the purpose of the 'people's courts,' whether in the Soviet Union or in the communist countries around, was not to try their prisoners for guilt or innocence but to arraign and condemn the enemies of the communist state, and proceedings of this hind were an indifferential past of the communist state, and proceedings of this kind were an indispensable part of the process of breaking down the opposition wherever communism bad selzed power. The appointed end of a conviction following on a 'confession' was, as usual, extorted by third-degree methods, the familiar prelude at this trial to the inevitable sentence. Immediately after the trul the United States was considered. incutable sentence. Immediately after the trust the United States gov. considered the possible course of taking the case to the United Nations. The House of Representatives unanimously adopted a resolution urging the United States gov. to protest against 11.'s treatment of the cardinal—through the United Nations or by other appropriate means. Numerous Hungarian officials in the United States, whicher the Astions counter the Course of the United States, and the United States, which the Astions counter the Course of including the Acting-consul general, in Inchiong the Acting tousin schema, in the Month of the Country. Dr. Evatt, minister of external affairs, Australia, in the House of Representatives, and that the issue was much broader than the treatment of the cardinal, and appeared to involve the general question appeared to involve the general question of rights guaranteed under the treaty of of rights guaranteed under the treaty of pence with II. to which Australia was a party, and which included freedom of religion and freedom of speech. He did not exclude a possible miscarriage of oust ce not only in relation to the cardinal but also to the leaders of the calvisist and bitheran churches in H. Thus matter was destined to be brought before the treneral Assembly of the United Nations, Mr. Ernest Bevin, brit, foreign scretary, protosted to the Hungarian minister in London at the Hungarian gov.'s refusal to allow representatives of the Brit. legation in Budapest to attend the trial. He also directed the Minister's attention to the very strong feeling evinced by public opinion in Britain over the whole circumstances of the case.

language.—Few languages offer more fast mation to the philologist than Hungaian. Until the seventeenth century it seemed a pure anomaly, for it was clearly not oven a distant cousin to the neighbouring Ger., Wallachian, or Russian. In 1769 an astronomer, John Sajnovics, visited the Laplanders in Norway, and was impressed by the similarity of their increasion that he forgot for the moment about his astronomy and wrote justead a book (in Lat.) to demonstrate the affinity

many other facts have come to light which a singularly pure and refined style both go to prove that Magyar belongs with yoguland Ostlak to the Ugric branch of divise. From 1772 to 1830 there was a the Finno-Ugric div. of the Ural-Altale family. There follows a brief enumeration of the most striking peculiarities of George Bessenyei (1747-1811) and Bone-Magyar: (1) It is a language of affixed. divising the means for my father, means for my father, means for my father, means for my father. tion of the most striking peculiarities of Magyar: (1) It is a language of affixes. Alyamer't means 'for my father,' m being 'my 'and ert' for.' (2) The active verbahave definite and indefinite forms: latom means 'I see him, her, or it, and latok merely 'I see.' (3) There is no gender: 'he,' she,' and 'it 'are not even distinguished. (4) Extra syllables give the verb a potential, causative, or frequentative sense: verhet means 'he can beat'; verel, 'he causes to beat'; vereet, 'he causes to beat'; vereet, 'he often beats.' (3) Nouns have possessive suffixes, which vary according to number: lollunk, 'our pen'; tollaink' our pens.' Magyar is, moreover, rich in verbal derivatives, has a copious yocabin verbal derivatives, has a copious vocabulary, and is decidedly musical—and therefore adapted to poetry—by reason of the harmony of its consonants and vowels.

Literature.-The national literature of H. is, comparatively speaking, young. Indeed, there was little life in it till well on in the eighteenth century. The cause if this is not far to seek. Ever since the nt this is not far to seek. Ever since the priests from Germany and Italy introduced Christianity during the eleventh century, Lat. has been the official language. It was spoken at court and in the churches: it was taught in the higher schools, and so became the language of the educated classes, and finally it was introduced into the administration. It was introduced into the administration. Lat. was not discontinued in the schools till 1790, and was talked in Parliament as late as 1825. The oldest written fragment in Magyar belongs to a funeral oration dating from the early thirteenth century. During the pre-lifeormation and Reformation periods (1437-1600) men of letters were chiefly engaged either in translating portions of the Bible or in writing voluminous rhyming chronicles. King Matting Parliaments of the Bible of the little o minous rhyming chronicles. King Matthias Hunyadi was a true Medici to his countrymen in that he made his court a centre of intellectual and artistic life, gathered together a great library, and invited to his kingdom men of learning from all parts. In 1173 the first book was printed in H., namely, Budar Krónika, a hist. of H. up to his day. During the seven-teenth century many writers distin-guished themselves in the fields of theology and philology, but none attained to such high honour as the poots Nicholas Zrinyi (1620-61) and Stephen Gyongyossi (1629-1705). The former wrote a national epic, the Zrinyinsz, after the manner of Tasso, in which he sang of the powers of his ancestors. There is life in his character followers of Arany, such as Joseph Kiss enactional, if appolished. The Venus of Muriny of Gyongyössi, though spollt lingarian stage with conedies and somewhat by an excess of mythology and metaphor, is redolent with an Ovidian grace of melody and descriptive charm. In the eighteenth century, not unjustly called the 'age of decadence,' the only outstanding name is that of Francis Faludi (d. 1779), the Jesuit, who developed and philology, but none attained to such

tive of the classical school, who took Lat. noets as their model. The former The former dreamed of being the Voltaire of II., whilst virag wrote epistles and odes which fully account for his proud title of 'the Magyar Horace.' Francis Kazinezy (1759-1831), Francis Kazinezy (1759-1831), who wrote readable didactic verse and good blography in prose, was the leader of the movement for language reform. Alexander Kisfaludy (172-1844), the author of the famous lyrics. Himfy's Love, was brother to the more celebrated Charles Kisfaludy (1788-1830), who may truly be said to have regenerated, if not created, said to have regenerated, it not created, national drama. Two other notable poets of this period are Francis Kolcaey (1790–1838), the idealist, who composed the Hymnusz, now a national anthem, and Joseph Katona (1791–1830), who wrote the fine historical tragedy 'Bank Ban' (1820), and is considered to be one of the greatest of Hungarian dramatic poets. One of the foremost of H.'s poots is Michael Vorosmarty (1800-1855). Had he left only his trans. of Shakespeare behind him, his name would have lived; behind him, his name would have lived; but as it is there are many fine lyrics and epics, such as the woefully tragic Two Castles, which prove Vorismarty to be a great original poet besides an excellent translator. In the splendour of his lyrics, however, he was surpassed by Aloxander Petofi (1823–1849), whose freshness, rapture, sincerity, and passionate love of Naturo have rarely been equalled in the poetry of any nation. And side by side with Petofi will ever stand John Arany (1817–1882). In his immortal epics, Toldi and The Death of Buda, as in his ballads, he absorbed all that is best in the old Hum and Magyar legend, whilst in the old Hun and Magyar legond, whilst in creating Nicholas Toldi he touched indeed the very depths of Hungarian character. The carliest historical novelist was Baron Nicholas Jósika (1794-1865), an enthusiastic admirer of Scott. The humour, spontaneous faculty for inven-tion, and irrepressible delight in story-telling of Maurus Jókai (1823-1904), explain at once his unbounded popularity as a writer of fiction.

The years 1825-19 proved a period of national revival, but this period was followed by one of less distinction, popular literature giving way to a litera-

anch Benedek.

In mod. Hungarian drama three schools may be discerned: the folk-drama, represented by Edward Toth, the neo-romantic drama, to which such writers as Engen Råkosi and Louis Dóczi belong, and the school of Gregor Csiky to which, among others, Francis Herczeg belongs. Naturalothers, Francis Herezeg belongs. Natural-ism in modern literature is represented by S. Brody (1863-1921), T. Kobor (b. 1867), and Z. Ambrus (1861-1932). The period-ical 'Nyugat' (West) founded in 1908 by Ignotus (Ilugo Velgelsherg, b. 1869) exerted a modernistic influence and counted among its chief contributors the lyric poets E. Ady (1877–1919) and D. Koszto-lányi (1884–1936), M. Babits (1883–1941), stylist and translator, and the naturalistic novelist, Z. Móricz (1879–1942), D. Szabós (1879–1945) and L. Zilalys (b. 1892 and living in America) exerted a great in-fluence after the First World War. Folkhierature is represented by the novelist J. Kodolány (b. 1899), and the poots G. Illys (b. 1902) and J. Erdelyi (b. 1896). Among Hungarian authors with an international reputation and living abroad are: 1903), M. Leve, J. 1895), and Kormendi (b. 1900).

Ari.—II. possesses a beautiful national art, but much of importance from the Middle Ages was destroyed in the wars with the Turks. The flat-rooted basilicas often show Lombardic and Byzantine influence in their decorative details. The shows the transition to the Gothic style which came to II. from France. Among other important buildings dating from the fourteenth to sixteenth centuries are St. Michael's Chapel and the Cathedral in Kosize (now in Czechoslovakia), the Black Church in Brasso (Transylania, 1383–1421), the Benedictine Church in Sopron, and a number of castles built by kings and nobles, e.g. that of Vajdahunyad. Biblical subjects began to be used in the and there are tombs and wooden and bronze sculptures which date from the fourteenth century (e.g., the statue of St. George in Prague by the brothers Kolozs-

vári). Rennais-ance art-forms were, with few exceptions, imported from Italy rather than of native growth, and little has been preserved. There was, however, a native revival in the Baroque period, which prorevival in the Baroque period, which produced somewhat ottentatious churches (the cathedrals of Gyor, Nyttra, Kalocsa) and palaces, and many W. H. tns., such as Gyor and Pozsony received their present stamp at this time. Many H. artists, such as the two painters Mányoki and Bogdán, worked abroad, whereas much was done in H. by Austrian artists. The representative architects in the class. period were M. Pollack (National Museum, period were M. Pollack (National Museum, de la Hongrie, 1939; Zoltan Baranyi, Budapest) and J. Hild, who designed the cathedral at Eger. The second half of the nineteenth century saw the creation of the main buildings of Budapest: the parliament (I. Steindil), opera (M. Yul), 1847.

Szentgyórgyl and another towards a styllsed formalism represented by I. Sinay, F. Pátzay, O. F. Beck, M. Vedres, E. Kalmár, G. Csorba and A. Koesis.

Painting, after its early beginnings in the Byzantine style, made great developments from the fourteenth to the beginning of the sixteenth conturn.

ments from the fourteenth to the beginning of the sixteenth century. A fine example is the altar-piece at Esztergom. In the first half of the nineteenth century painting, influenced by Vienna, moved from classicism to romanticism (Markó Barabás). After 1848 national hist, begans the point the result of the control of th came the main theme (Madarasz, Benezúr) Chef among genre and landscape painters were Paal, Munkússy, Mészóly, Med-nvánszky. French naturalism and im-pressionism influenced Iványi-Grunwald, Ferenczy, Thorma, Méti, Vaszary, Fényes, Cook, kernstock and Rippl-Ronay among others. Most recently painters such as Marity, Czobel, Rudnay, Egry and Bernath have come to the fore still under the influence of expressionism.

H. music occupies a characteristic position between E. and W. The oriental streak is clearly discernible in the folk-music, but apart from this H. music was, until recently, completely W. Euro-pean in style and tonality, when B. Bartok and Z. Kodaly, both of whom are extremely interested in folk-music, made great use of it in their own compositions, thus giving their music a markedly national character. It was mainly due to Fr. Liszt, Fr. Erkel (nincteenth century). and their predecessors S. Tinodi (sixteenth century) and J. Kajoni (swenteenth century), that an interest in H. music was awakened in W. Europe. The chief modern composers are J. Adám, G. kosa, L. Bardos and A. Veress, all influenced by Bartók and Kodály.

Hunger, indefinite sensation usually referred to the stomach, but also combined with a non-localised feeling of weakness or faintness. Normal H. is not of necessity strictly periodic, but training may result in its recurrence becoming regular. In its earliest stages no suffering accompanies it, but later a gnawing pain sets in at the epigastrium, followed by weakness, and finally by the delirium of starvation. The general faintness is normally removed by the introduction of solid or sem solid nutriment into the alimentary tract, even though the stomach is not used, as in the passage of easily assimilated food into the large intestine. The almost immediate alleviation of suffering may be caused by the free secre-

Development of Hungarian Constitutional Liberty, 1908: A. B. Yolland, Hungary The Nations' History Series,' 1917: Series,' 1918: Series,' 191 tracts between the Oxus and the Caspian in the days of Attila's conquests. In 484 they inflicted a crushing defeat on their Persian neighbours under Peroz, who was slain in battle, but during the following century their power was broken by the aggressive Turks. (3) The Hûnas, who made inroads into India were contemporary with the Ephialites, and undoubtedly belonged to the same wave of barbarlan migration. (4) But hist, has most to say about those savage hordes of H. who contributed so largely to the dis-H. who contributed so largely to the disintegration of the Rom cupire, and who from A.D. 372 to 4.3 were continually from A.D. 372 to 4.53 were continually threatening, nay thrusting back, imperial confines. An army of H, under Balaiair, overcame the Vlani, who dwelt between the Voga and the Don, completely disorgamised the empire of the Ostrogoths (Greutungi), and innally routed the Visigoths (Tervingi). These tribes were driven to seek new homes between the Parth, and begular but in threat between Pruth and Danube, but in time their ferocious conquerors wrested even these lands from them and obliged them to retreat still farther, this time beyond the Danubian frontier. Two facts show that Rom. supremacy was already on the wane: Emperors had begun to callst the arms of the Hunnish invaders against other foes, and in 132 Theodosius II, agreed to buy peace from Rhuas or Rugulas, their king, by an ann. payment of 350 pounds of gold. surering may be caused by the free secretion of gastric piece which may be brought about by the ingestion of indigestible substances. Abnormal H-accompanies some diseases, particularly those associated with marasmus. Other diseases cause morbid appetites, as the craving for chalk and lime, etc.

Hungerford, par. and tn. of Berkshire, England, on the Wilts border. The anct. name was Ingleford, meaning for dot fit.

armies before the walls of Constantinople; armies before the walls of Constantinopie; in 451 his progress westward across the Rhine was only stayed after a terrible battle on the Catalaunian plains (near Méry-sur-Seine), and in the following year, after razing Aquileia and the cities of Venice, Attila was confronted with Pope Leo I. on the banks of the Mincio—an interview which ended in a retreat of the H beyond the Alps. Next, was Attila. H. beyond the Alps. Next year Attila d., and in 454 the Goths, Gopide, and Suevi avenged his insolent victorics near the R. Netad in Pannonia, where 30,000 H. were slain. The Hunnish nation never survived this calamitous defeut; their tribes dispersed, some settling in the Dobrudzha, others in Dacia, and others, again, returning to their old haunts- the S. steppes of modern Russia. Perhaps the Bulgarians are at the root a Hunnish people. See M. A. Craphekn. Turks of Central Asia, 1918; R. Saffet, Contribu-tions à une sincère histoire d'Attila, 1934;

Hunt, Alfred William (1830-90), Eng. painter, b. in Liverpool, son of Andrew H., a landscape painter. He won the Newdigate Prize poom in 1851. He exhibited landscapes in oil and water-colour at the Royal Academy, and took up nainting professionally in 1861. His best pictures are in water-colour. Fine examples are in the Tate Gallery, London, and the Walker Art Gallery, Liverpool. See F. Wedmono. in Magazine of Art, 1891.

Wednero, in Magazine of Art, 1891. Hunt, Honry (1773-1835), political agitator, the son of a Wiltshire farmer, on agitator, the son of a whishire fariner, on whose land he worked. For some years he worked in conjunction with Cobbet, and in 1810 they shared the same celling good, to which they had been committed for their political opinions. He mitted for their political opinions. He more than once stood for Pathament, but he was nover elected. He was an active member of the Hampton Club, and he presided over the meeting in St. Peter's Field, Manchester, in Aug. 1819, which, owing to the intervention of the soldiers, is known as the Peterloo Massacre. There is no doubt that he was of value to the cause of which he was an advocate. He pub. his Memoirs in 1820, and his Correspondence appeared in the same year. There is a worthless biography by R. Huish (1836).

The quality of the verse was not years. such as to merit much success. H. began to contribute dramatic criticism H. began to contribute dramatic criticism to the News, and a selection of his articles was reprinted in book form two years later. In 1808 H. and his brother John started a newspaper, the Examiner, and for thirteen years wrote largely in its columns on many subjects, taking part not only in its literary direction, but also contributing political leaders. His persistent attacks on the character of the Prince Regent led to a gov. prosecution

LLIGH HUNT

of the brothers in 1812, and they were sentenced to two years' imprisonment. It was while he was in prison that Thomas Moore introduced him to Byron, which was the beginning of the famous friendship between these men. At this time, too, he made the acquaintance of Keats, and ne made the acquaintance of Kears, and mtroduced him to Shelley. He pub. ser. vels. of poems, including The Story of himma (1816). In 1822 H. wat to Italy to join Byron, with whom later he courrelled. In 1825 he returned to English land, and three years later he pub. Lord Byron and some of his Contemporaries, which brought a hornet's nest about his ears. All this time he was working very hard. contributing to the newspapers, citting periodical, writing dramatic citicism and book-reviews, and every now and then issuing a book. He wrote a novel Sir Ralph Laher (1832), and a vol. Huish (1836).

Hunt, Leigh (James Henry Leigh-)

(1784-1859), author, was educated at Christ's Hospital School, London, to which he went from 1792. He was a shy, nervous, sensitive lad, and at a very early tage he read poetry and began to write verses, which his father collected and publin 1801 under the title of Jurentia, or A Collection of Poems uritten between the ages of twelve and sixteen, by J. H. L. Hunt. Owing to the elder Hunt's energy, a large subscription was obtained, and the little book passed through four eds. in three on Christianism, and he reprinted the best

high praise from Carlyle. It was as a poet that II. desired to achieve fame, but it cannot be said that his ambition was ever satisfied. His verse was easy and agreeable, but it lacks dignity: he had not the lyrical gift, and has never taken the place he desired to fill in the roll of Eng. poets. It is as an essayist that he has his claim to remembrance. In this has his claim to remembrance. In this branch of letters he does not, of course, rank with Lamb or Hazlitt, but he has undoubtedly, on a humbler plane, an individuality and a charm of his own. His wide reading and his knowledge of the world gave him ample scope for inding suitable subjects for his innumerable papers, but he is never happier than when writing of 'My Hooks,' or discoursing about London, or describing the country. His Authiography, and his Corresponding His Autohiography, and his Correspondence, ed. by his eldest son (1862), are the prin. authorities for his life. The character of Harold Skimpole, the sponging amateur artist, in Dickers' Bleak House, was founded on H. and had to be altered was founded on H. and had to be altered on account of its close resemblance. Nee S. Collins, Keats, 1885; W. Hazlitt, The Spirit of the Age, 1891 (Everynan's Library, 1910); lives by E. Blunden, 1930, and L. Landré, 1936, and also the Autobiography, ed. with notes by J. E. Hunt, Richard Morris (1828-95), Amer. architect. b. at. Brattleborough. Vermont.

Hunt, Richard Morris (1828-95), Amerarchitect, b. at Brattleborough, Vermont. He came to Europe to study, chiefly in Paris, where, in 1851, he was appointed inspector of works on the buildings connecting the Tuileries with the Louvre, and where he designed the Pavillon de la Bibliothèque. Iteturning to New York in 1855, he designed the Lennox Library, the Stuyvesant, and Tribune buildings; also public buildings in Princeton and Yale. He obtained the gold medal of the Institute of Brit. Architects for his Administration Buildings at the Chicago Exhibition (1893). He did much to raise Amer. architecture in the opinion of other countries, and helped to found the Amer. Institute of Architects. There is a fine memorial to him in the well of Central Park, New York City.

memorial to him in the well of Central Park, New York City.

Hunt, Thomas Sterry (1826–92), Amer. chemist and goologist, b. at Norwich, Connecticut. He wrote a remarkable 'Essay on the History of the Names Cambrian and Silurian' (Canadian Naturalist, 1872), and his works include 'themsel and Geological Essays (1875) Many at Manager. Geological Essays (1875), Mineral Physio-logy and Physiography (1866), A New Basis for Chemistry (1887), and Systematic

Mineralogy (1897), and Systematic Mineralogy (1891).

Hunt, William Henry (1790-1861), Eng. water-colour painter, b. In London, and studied with John Variey. He was a prominent member of the Society of Painters in Water Colours, and may be regarded as one of the chief figures in the great Eng. schsol. His prin. pictures were of interiors, figures, and still life.

Many fine examples are in the Victoria and Albert Myseum, S. Kensington.

Hunt. William Holman (1827-1910).

Hunt, William Holman (1827–1910), Eng. painter, b. in Loudon, joined the Royal Academy schools (1844), gaining admission to the exhibition with Hark

It was as a dieve fame, but ambition was und was easy and miv: he had as never taken to interest that he sayist that he ance. In this archive is content of course. and Isabetta (1833). In 1854 came, perhaps, his greatest and certainly most successful religious picture, 'The Light of the World,' presented to Keble College, Oxford, by the purchaser, Mr. Combe, of which a modified replies was painted in 1901 and exhibited in the chief cities of the Britt Auditor. A right to Pulse. of the Brt. cupiro. A visit to Palestine produced 'The Scapegoat' (1856), a meticulous study of the scenery of the Dead Sea: 'The Finding of Our Saviour in the Temple' (1860), now at Brrningham: 'The Shadow of Death' (exhibited 1872). 1873), representing a shadow of the Crucifixion thrown on the workshop wall by the stretched arms of Jesus, is at Manchester: ' The Trumph of the Innocents,' of which there are two pictures, at Liverpool and Birmingham, begun in 1875, was not tinished till 1885. His best-known lader picture is 'May Day on Magdalen Tower, Oxford' (1891). H. remained to the last a fervent adherent to the principles of the Pre-Raphaelites. The best statement of a tervent adherent to the principles of the Pre-Raphacities. The best statement of his ideals and of the inner hist, of the movement is in his History of Pre-Raphacitism (1907). He received the Order of Merit, and was buried in St. Paul's. See Ford Medox Brown, Pre-Raphacitie Drawes and Latters, 1900; J. Phythian, Pre-Raphacitic Brotherhood, 1906; L. Housman, Pre-Raphacities in Art and Poetry, 1933.

Hunter, George (1863–1946). Scottish

Art and Poetry, 1933.
Hunter, George (1863-1916), Scottish missionary, b. at Alerdeen. At 26, left Scotland, and set out on the long trek to Chinese Turkestan. At Urumtsi, cap, of Chinese Zungaria, he built himself a rough home; and for many years he travelled in his little Chinese curt on the trade routes across the high plateau, conveying the Scriptures trans. by him into the various local dialects. In H.'s early days, Chinese wore pigtails; so he grow his own, and were a simple blue gown. One Mongol servant was his only usual companion, and provided the same meni overy day for 50 years—boiled mutton and rice. day for 50 years—poned mutton and rice.

Robbers were not his only danger, but he was on good terms with camelinen, Qazam fatmers, and Sarter merchants trading in wool, skins, and bricks of tea. Unselhsh and dovoted, he had great in fluence on the wandering folk of Chinese Turkestan. When war came in 1939, his presence on the barder of the Soviet. presence on the border of the Soviet Union aroused the suspicion of the Russian authorities; he was watched, arrested as a 'secret agest', and kept under terrible conditions in a Soviet geol. He was refused a copy of the Bible, but ne was refused a copy of the Bible, but knowing most of it by heart, he recited it aloud. Released and flown back into China proper, where he d, in 1946. See Mildred Cable and Francesca French, George Hunter, Apostle of Turkestan, 1948. Hunter, John (1728-93), Scottish sur-geon and anatomist, b. at Long Calder-

wood, K. Kilbride, Lanarkshire; son of John H., and brother of Wm. H., whom he assisted in dissection in London (1748). He attended Chelsea Hospital under Cheselden, 1750. In 1751 he became pu-pil at St. Bartholomew's. A Muster of Anatomy, Surgeon's Corporation, 1753. Surgeon's pupil, St. George's Hospital, 1751; house-surgeon, 1756. Matriculated,

JOHN HUNTER

St. Mary Hall, Oxford, 1755; but classical studies bored him. In 1761 he took part in an expedition to Belleisle where he studied the conditions of the congulation of the blood), and served with the Brit. army in Portugal in 1762, acquiring knowledge of grushot wounds and inflammation. In 1763 he started a practice in London, but devoted his spare time to dissection and experiment. He became surgeon to St. George's Hospital, 1768; surgeon-extraord, to the king, 1776; deputy-surgeon-general to the Army, 1780. His works include many papers contributed to Photosophical Transactions and A Treatise on the Natural Instance in the Human Peth (1771-1778), On the Digestion of the Slomach after Death (1784), A Treatise on the Veneral Disease (1786), Observations on Certain Parts of the Animal (Economy (1786), A Treatise on the Blood, Inflammation, and Gunshot Wounds (1791), Observations and Reflections on Geology, pub. posthumously. H. made a notable surgical advance in the tying of the artery about the scat of disease in ancursm; indeed, he has been called by some the founder of scientific surgery. He was exceedingly industrious; but he was a poor lecturer, and never had many punils. He was a bigoted Tory in politics, cholerio, and stiff-necked. He died sud-

anatomist, b. in Lanarkshire. He studied at Glasgow, Edinburgh, and St. Georges' licepital, London. He became the leading obstetrician of his time, and was consulted by Charlet and Charlet an mg onscerrcian of his time, and was consulted by Queen Charlotte, to whom he was appointed physician extraordinary in 1764. He was the first prof. of anatomy in the Royal Academy (1768), and president of the Medical Society (1781). His chief work is On the Human Gravid Uterus (1774), at 1 the metastic for which the little of the Medical Society (1781). (1774, Lat.), the material for which took him twenty-rive years to collect. It has been ed. by Baillie (1794) and Rigby (1813). He also pub. Medical Commentaries (1762-64), and important papers on Medical Observations and Inquiries. Hunter, Sir William Wilson (1840-1900), Indian civil servant and historian, was subjected at Clasgow. In 1869 he was

was educated at Glasgow. In 1869 he was appointed by Lord Mayo to organise a statistical survey of the Indian Empire. This work occupied him for twelve years. i This work occupied him for twelve years, the compilation reaching 128 vols., but the whole was condensed into The Imperial Cazetleer of India (9 vols., 1881), his article on 'India' being reissued in 1895 as The Indian Empire: its Peoples, Illistory, and Products. He also pub. a Comparative Dictionary of Non-Aryan Languages of India and High Asia (1868). Hunter see water Horses.

Hunyadi Janos, or John Corvinus Hungali (J. 1227 1112)

yadi (c. 1387-1450), emiuent Hungarian soldier, b. at Hunyad in Transylvania. At an early age he entered the service of King Sigismund and distinguished himself in the Hussite wars. After the death of Albert in 1139, he co-operated in the clection of Ladishus III., who made him volvode of Transylvania and captain of the fortress of Belgrade. In subsequent struggles with the Turks he won victories at Szendo (1111), at Szentimne, and the Iron Gates of the Danube (1112), but was defeated in 1444 at Varna, where the king met his death. II. was made governor of the country during the minority of Ladislaus V., but had continually to contend against the jealousy of Gara and the Czillei. In 1453 the king was declared of age, and H. organised a Turkish crusade, during which he won his last victory at Mendor Febara in 1456, dying of plague in the camp three weeks after the battle. He was the first great Hungarian general in a modern sense, as he was the first to depend chicily on strategy and tactics for his victories.

Hunza (also Kanjut) and Nagar, two small states on the N.W. frontier of Kash-Hunza (also Kanjut) and Nagar, two small states on the N.W. frontier of Kashmir. The two states, though peopled by the same Dard race, were always at war, and when the Glight agency was estab. In 174 he was appointed to the see of Lichfield and they turned their attention to the Brit. agent. This led to the Hunza-Nagar expedition (1891) under Col. A. Durand, the storming of Fort Nilt, and the subsequent of Moral and Political Dialogues (1769)

occupation of the two states by Brit. troops.

Huolu, or Huailu, tn. of China, in the prov. of Chili, in 38° N. and 114° 26' E.

prov. of Chili, in 38° N. and 114° 26′ E. It is at the foot of the pass which leads from Chili to Shansi, with which a trade in coal, iron, and pottery is carried on. Huon Gulf, extensive inlet, in the E. of Ger. New Guinea, situated between lat. 6° 45′ and 7° 30′ S.; it possesses sev. fine harbours. In the Second World War, the Jap., having invaded New Guinea early in 1912, held most of the H. G. area by nid-March of that year. Salamana was taken later in 1942 and become Japan's mid-March of that year. Salamana was taken later in 1942 and became Japan's chief centre in the H. G. area. Landings were also effected at Lae, further N. subsequent fighting in the Salamana-Lae area the Jap. lost at least 12,000 men and by 1914 their garrisons had been reduced to impotence. See Jurther under PACIFIC CAMPAIGNS IN SECOND WORLD WAR, and NAVAL OPERATIONS IN SECOND WORLD WAR; also under NEW GUINKA.

Huon of Bordeaux, contral figure or hero of a thirteenth-century Fr. chanson de aeste called after his name. The poem is a mixture of the older historical epic and the later romances, and contains historical and purely legendary matter, the latter being marked by the character of the fairy being marked by the character of the fairy Oberon or Auberon. It was printed in a prose version in 1516, and was trans. Into Eng. by Lord Berners, 1540. See Guissurd and Grandmalson, Ameiens Poetes de la France, 1860; S. Lee ed. of Berners' trans., 1853; and Gaston Paris's ed., 1898. Hupa, or Hoopa, name of an Indian tribe who inhabit the Hoopa valley, was the formula and who formula by the first and in ribe.

Hurnerne, single stat low wing canti-lever monopline. It was designed by Sydney Cimm an employee of the H G Hawker Lugincering Company which in 1335 changed its name to Hawker Air rat 1 td and later to the Hawker Sid dely Ancieff to Ltd It its early days while it was still on the drawing board the Il was known to the Hawker (o) is the I my monoplane and was designed for the (() hp Rolls Pov (Casha v steam coled motor but in 194 this vator was dragged for the Rolls haver Me in II, a 12 cylinder liquid cooled engine giving h p at 1,000 ft. This was the engine und in the H. Muk. I. she first II, thown by Grorge Bullium on Nov 6, 1931, with first long nighter that had a re tri tible undercarring and an enclosed ce kpit, or conservatory know that time the H was after divery little in essen From that til the only import at alteration being instead of have if a tabric covering, thi the wings were all rectal with a stress skin. The standard its weight of the H. wi then 6,600 lb bu for special purposes it could fly at more than 7,000 lb. In its crainal design the H was to be armed with I machine guns all inside the fuseand all firing through the airserew disk by means of in crrupter gear, but sub-equently it was litted with 8 guns in a now outside the arrows, where they could fire at their own limit of speed without reference to the argine. The H was put into production only in 1935 and the first machine off the production line was flown in Oct. 1937. Later, the 8 Browning guns were fitted, 4 in each wing and on each side of the fuselage, firing outside the disk swept by the airscrew. After its carly trials, the tail-wheel was made nonretractable and, with a two-blade, fixedpitch wooden air-crew, the top speed was 330 m.p.h. at 17,000 ft. With metal wings and Rotol constant-speed airscrew, the top speed was 335 m p h, at 17,500 ft. This was the stage of development made known just before the outbreak of the Second World War; but even then, by improvements and refinements, the actual speed of the H. was far beyond these figures. The H., together with the Spither (q.v.) was used against the Gers, at the Battle of Britain (q.v.) with annihilating

Hurst Castle, par. and castle of Hampshire, England, situated about 4 m S W of Lymington. The castle was erected by Henry Vill. for the purpose of defending the Solent. Charles I was imprisoned here (1648). It is a fortress and look out station. At the rear of the point of fortifications are two lighthouses with occult-

ing and fixed lights.

Hurst, Fannie (Mrs. J. S. Danielson), Amer. writer, b at St. Louis, Missouri, 1889. Educated at Washington and Columbia Univs. She became one of the Columbia Univs. She became one of the highest-paid magazine writers in the U.S.A. She has also written novely, somewhat marrid by an affected style. President, Authors Guild of America, 1936-37, Vice-President, Authors League of America, 1944-42, Chairman, Women's National Housing Committee, 1936 1937; Member of National Advisory Committee to the Work Projects Administration 1940-11. istration, 1940-41. Among her best books are Gaslight Sonatas (1913), nooks are clastign Sonatas (1914). Humoresque (1919), Stardust (1921), Lummos (1923), Five and Fen (1929), Instation of Life (1933), Antira's Dance (1931), Freal Laughter (1936), Lonely Parate (1942), Hallelujah (1941), The Hands of Veronica (1945), We are Len (short stories, 1947) 1937).

Hurstmonceaux (Herstmonceaux), vil. of Sussey, in the Eastbourne parl, div. 9 m. from Eastbourne The name is derived from Waleran de Monceux, who was lord of the manor in the eleventh century. There is an interesting and exceptionally well-preserved castle in the exceptionally well-preserved castle in the vil H. castle was built by Sir Roger do Fienes, treasurer to the Household of Henry VI It was he who obtained a heence in 1441 to enclose, tenellate, and furnish with towers and battlements his mand of H. There are no brick buildings 5. of the Phames earlier in date than the castle, which is probably not only the best of the carly brick buildings of England but the most beautiful of Eng baronal buildings. The mouldings and dressed work are mostly executed in greensand work are mostly executed in greenand stone which permits of sharpiness of detail. After 1740 the castle fell into neglect and in 1777 the interior, including the buildings in the court within the main rectangular structure, were demolished and the materials used to build the mansion

of the old fabric beyond the outer walls, with their towers, and portions of the inner walls. In 1911 the castle was pur-chased by Col. Claude Lowther, who began the work of restoration. After his death it was acquired in 1932 by Sir Paul Latham, who completed the restoration (a description of the situation of the castle will be found in Francis Grose's Anti-quities of England and Wales, written in the cighteenth century; see also article by Sir Harold Spencer Jones, Astronomer Royal, in Vature, July 20, 1940). Exten-sive search has been made for a new site for an observatory; putity of atmosphere being an essential, the removal of the observatory from Greenwich had to be faced. H. castle was selected by the Admiralty and along with the castle some 170 ac of ground were acquired for the erection of the instrumental equipment and also as a safeguard against encroachment too near the observatory of other buildings

Hurstpierpoint, par. and tn. of Sussex, England, 8 m N. of Brighton, and 2 m. from Hassocks (its station on the S. Region railway). Holy Trinity Church is a une modern building. Here is st John's Col-lege, a public school for boys Pop. 3000.

Hurtado de Mendoza, Diego (1503-75), Sp. diplomatist, poet, and historian, b. at Granada, and educated at the univ. of Salamanca, also attended lectures at Bologna, Padua, and Itome whilst serving under Charles V. He was sent as ambassador to England in 1,38, to Venice in the following year, acted for some time as military governor of Siona, and repre-ented the diplomatic interest of Spain at the Council of Front. From 1547 to 1554 he was special plempotentiary at Rome; being obliged in 1508 to leave the Court on account of a quarrel with Philip II., he settled at Granada and devoted himself to the study of Arabic poetry and to the production of his best work, the Guerra de Granala a hist of the revolt of the Moors of Alpuanas under Philip II. This hist., although written in 1972, was not pub. until 1627. His talents as a poet were of no mean order, and he popularised the classical It, hendousyllables. He is generally allowed to be the author of that great pre mesque novel Laurellode Tormes See A Senin y Alonsa Diego Hurtado de Mendosa apuntes biografuo criticos, 1886; and monograph by A. G. Palencia and E Mele, 1912-13.

Husband and Wife. The consideration of the essentials to a validly colebrated marriage, and the various recognised forms, past and present, of the ceremony or contract of marriage itself, are not dealt with in this article, and will be found dealt with under MARRIAGE, and the subject of the dissolution of marriage will be found under Alimovy. Divorce, Judicial Sharario, and Marriage. This article is restricted to the rights and After 1710 the castle fell into neglect and in 1777 the interior, including the buildings in the court within the main rectangular structure, were demolished and the materials used to build the mansion now known as H. Place. Little survived the opposite extreme, allowed the relationship of husband and wife to be contracted and dissolved by the slenderest forms, and left the parties all but inde-pendent of each other. This evolution has found its parallel in the social systems of many modern states, both as regards the personal freedom of the wife and the immunity of her separate property from

Theoretically each spouse has a legal right to the soriety and presence (con sortum) of the other, but in Ing I we neither the petition for restriction of con production for a sortum with the control of the soriety and present a sortum and the state of the sortum and the sort jugal rights nor any other proceeding will avail to inforce that right. A husband has no legal light to restrain his wife from laxing him, and will even be ordered by the court to abstain from molesting her if she choose to stry away Indeed, any physical compulsion put upon a wife is illegal, and in many cases would amount to cruelty so us to found a chilm for pudicial separation (q t). On the other hand, if a wife choose to leave her history at their terms of the control of the co band without idequate cause, he is en-titled to refuse to admit her into his ho ne again, and the converse probably also applies. The suit for restitution of on jugal rights is in the free than a formal condition presearch to the subsequent formulation of a charge of desertion. The practical value of consortium lies in the right of the husband to bring an action of damages against a third party who has conticed away his wife, though the archains of the law still survive in the denial to a wife of a corresponding action remark to a wire of a corresponding action. The action of term con (criminal conversation), as it was called, for durings in trespast against a min who his committed adultery with the plaintiff's wife was abolished on the estab of the Divorce Court in 1857, and probably damages can relative the planting of the conversation of the property of the conversation of th only be obtained against an idulterer by olting him as co respondent in a divorce petition, for it seems to be the better opinion that even the above noticed action for enticing away is competent only to the case of one who is deprived of the services of his employees (se further on this, Jenks, Husband and Wife in the Lau, 1909 and Pollock, On Iorts) But each spouse may sue for dumages for the loss of the 'comfort and sourty' of the other spouse where the latter has been physic ally injured by the negligence or inten tional wrongdoing of a third party. By a legal anomaly, however, the claim for damages when death results is restricted to the actual pecunitry ioss sustained By the old common law the fither as

the legal guardian by nature and uniture has the complete control over the person the education, and religious upbringing of his children during his lifetime, but covenants in separation deeds not to in sist on the custody of children will bar the right, as will an order of the Divorce Court with respect to the custody of children. But either parent convicted of crueity to a child under sixteen may be

common law, and one eminently in accord ance with foudal principles, was that H. and W were one in the eye of the law. But this unity on its proprietary side was I he wife's freeholds became vested in the husband and herself jointly during cover ture (q v.) but the husband had the sole management and took the rents and promanagement and took the rems and pro-fits, while if the wife prodecased him, he had a life estate in the wife's treeholds called a tenney by curtesy (see under CURI'SY) Luthor the wife's personal projectly, comprising lessoholds, and choses in when reduced into posses sien (se under (HOSF IN ACHON), passed to the husband on mutuage or became his if it what subsequently acquired by the wil I is t equity (q r) and then statute in encrosched upon and finally whitled away practically all these marital rights I not medical the common law by the doctrine of the 'separate uso,' by which my projectly expressly given to the wife belor or intermittings,' for her separate use visited from the husband's control subject to the lines and scalain to any part of it in hipsest of by her death and by the restaint or anticipation, which, where it is hed to a gift of property to her che tally kept that property fice from her rish and a persuasive influence, so far as presented in come was due, by the simple fact that she herself could not antipite it. The Married Women's Property Act, 1883, effected a radical change in the wife's propretary position, then the old law, as modified by equity and statute law prior to 1882 still applies to women married before Jan 1, 1883 In Act of 1882 made a marriel woman to enter into contracts as a feme that Act her contracts bound her separate estate so far as not restrained from anticit it in and, generally spriking, the Act put a married wo man in the same cu ati m po itim as an unmairied withan with respect to all her property. But the his bind still had the right to her property by sirvivorship if she died intestate (see further under of ((1000), ININSTATE) I urther, the Act applied to all women marined before Jan 1 1003, s regards all pr perly acquired by them since that date in ict passed in 1355 makes notable changes in the law relating to the capacity it perty, and habilities of married women smiler to that of the single woman, so that she is now able to hold and to dispose that she is now able to note and to dispose of any kind of property, render herself, and be rendered, had in respect of any contract debt, or tort (see TORT), sue and be sied in contract or tort, and be subtto the law of tankrupty and to the conforcement of judgments and orders, in all respects as if she were a single woman. pussing of 'a Att was the separate property of a married woman or held for hat soparate use in equity, or belonged to hat at the date of har marriage or, after the Act, has been acquired by her or devolves upon her, belongs to her in all deprived of the custody of it.

has at the date of his marriage or, after the Act, has been acquired by her or another's property, and obligations arising devolves upon her, belongs to her in all from marriage.—The anot. maxim of the respects as if she were a single woman and may be disposed of by her accordingly. The Act also abolished the restraint on anticipation (see supra) as to instruments effected after Jan. 1, 1936. Notwith-standing the existence of a clause re-straining the wife from anticipation, the court may, under the Conveyancing Act, 1931, bind her interest for her benefit and with her consert and in our with her consent, and in any case the clause will not save her property from hability for her ante-nupital debts, except to the extent of any part of her property that had not actually reached her hands when the debt was incurred. With this enfranchisement of the wife's property there have been corresponding augmentations of such rights as she had in the property of her husband. At common law a widow was entitled to a dower or a life income of one-third of her husband's freeholds of inheritance, whether he had disposed of them prior to his death or not; but as this right was illusory by reason of the conveyancing device known as 'uses the conveyancing device known as uses to bar dower, equity gave her a right to dower out of her husband's equitable estates of freshold so far as not disposed of by him. The wife is still legally entitled to dower, but in practice settlements usually contain declarations against dower (Jointure (q.v.) also hars dower.) But, on the other hand, a write now has stronger claims on her hu-band's personalty, assuming he dies intestate (see Distribu-rions, Statutes of). There is nothing to prevent the husband, any more than the wife, from willing away the whole of his personalty from his wife.

Husband's generally make their wives a periodical allowance for housekeeping. Strictly the wite can be called upon to account for every penny of this. If she saves any of it, the balance belongs to her husband, and if she invests such savings or puts them into her banking account the husband can get an order of the court the husband can get an order of the court summarily transferring such investment or savings into his own account, though if the wife disputes his title, he must prove that he had no intention of giving her any surplus. Each spouse can suo the other and bring crimmal proceedings against the other for the protection of his or her separate property. But a married woman may not proceed criminally against her husband while they are living together, nor after they are separated, as to wrongs to her property committed before separation, except in respect of property wrongfully taken by the husband

on leaving or deserting her.

It is a dogma of king, law that the husband has the right to choose the house, and it the house is in his name, it follows, and it the house is in his name, it follows, not from the matrimonial relationship, but as an ordinary result of the law of contract, that the husband has the right to allocate the rooms for various purposes, and contract the rooms for various purposes. and, generally speaking, regulate the domestic arrangements. If, of course, the wife leased or bought the house, or if

such illegitimate or other children as the wife may have had in marriage). But apart from payments ordered by a magistrate to be made for the support of a deserted wife on a separation order, the only means of enforcing the undertaking to maintain is through the Poor Law Authority, if and when the children or Authority, it and when the children or wife become chargeable to par relief. But the wife may pledge her husband's credit for necessaries for herself and the children, even where she has separate property of her own. The wife's liability for maintenance apparently only arises on the entire failure of the husband. But the law is by no means clear as to the exact circum-stances when the wife's property can be resorted to for this purpose. Apart from the purchase of necessaries, the wife has no right to pledge her husband's credit, and it is unwise for trade-men to assume and it is unwise for transmen to assume that she has, for the reason that the hus-band can rebut the presumption that he has authorised his wife to pledge his credit, by proving either that he has expressly or impliedly forbidden her to do expressly or implicitly torbidden her to do so, or that he makes her a sufficient allow-ance. If the husband by paying bills leads a particular trade-man to holley his wife has authority, he must give the trade-man express notice that he gives no turther authorisation, if he desires to prevent the wife from further pledging his credit with that tradesmon. The mere fact that a tradesmon enters purchases in the wife's name and that she invariably pays with her own cheques, and that the trade-man did not know she was a married woman, will not make her separate property liable if, in fact, she did not contract otherwise than as her husband's agent (Pagun v. Betweek, 1906, A. C. 118)

Before the Act of 1935, the husband was Bi fore the Act of 1935, the husband was lable for the wife's ante-nuptial debts to the extent of any property he may have acquired through her, but the new Act abolishes his liability for his wife's antenuptial debts and obligations. The Act, however, makes no change in the law regarding the husband's habilities for his wife's necessaries. For his wife's antenuptial civil wrongs the husband's liability is similarly postreted, but he least bility is similarly restricted, but he is liable without limitation jointly with the wife for civil wrongs (torte) committed by her during marriage, provided the parties were cohabiling at the time. But the wife incurs no liability in respect of the husband's debts or civil wrongs. As to the pre-unnition that a married woman's crimes are presumed to have been committed under the coercion of her husband, and as to the criminal liability generally of married women, see under CRIMINAL LAW. Neither spouse can give evidence against the other when the latter is charged with a criminal offence; but by the Criminal Evidence Act, 1898, such spouse can give evidence on behalf of the the wife leased or bought the house, or if it stands in her name, she can legally excitude the husband from entering it.

Each spouse is assumed to have undertaken the maintenance of the other and of the children of the marriage (including the absence of fraud a policy taken out

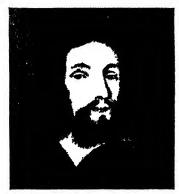

by the husband and expressed to be for the benefit of his wife or children or both can never be touched by his creditors A busband is liable for his wife's income tax, and apparently if the refuses to pay and he cannot, he can be kept in prison until she does pay. An important change was introduced by the Administration of Estates. Act. 1925, which affected the rights of a wife in her husband's property Down (or the right of a widow to a life estate in critain lands of the husband) was practically abolished. On the death was practically aboushed. On the death of an intestate husband the wafe takes (1) all personal chattels absolutely, (4) furniture, plate, pictures, household effects, etc. (2) £1000 free of death duties with interest at 5 per cent from date of death. (3) the income of the whole residue for life of the hu-band le vecs no issue, and of half the residue if he leaves. The life interest may be capitalised should this be desired in order that the residue may be freed for immediate distribution to other beneficiaries.

The Scots law of husband and wife is not now markedly dissimilar to the Eng, since the passing of the Married Women s Property ("cotland) Act, 1881. But the Act of 1932 (noted shove) does not apply to Se other 1 or N "reland). The wife has a se parate estate in her movables, and But the The wife property belong to her Parties inarried before the Act can come under its opera tion by mutual deed and in any case come under the Act unless the husband before marriage has by irrevocable deed made reasonable provision for his wife in the event of her surviving him. The wife is not entitled to assign her prospective income from more thick or dispose of her morphies without her husband's consent. The husband has a right of succession to his wife a morphica if she die intestate. The widow is entitled to a life rent of one third of her husband's estate and one half or one third of the movable c-tate (one half it he wire without issue, one third if he lett issue) See & Jenks, Husband and Wife in the Iau, 1909 Lush, Iau of Husband and Wife Pollock, On Toris

Husband and B ife Polices, On Three Husi, Hushi, or Husch, in of Moldavia, Rumania, situated 9 m W of the Moldavia, SAR border Wine is largely produced and there is a neted yearly fair The treaty of Pruth between Turkey and Progress was here signed in 1711. Pop

16,700 Huskisson, William (1770-1830) Brit state-man, after a preliminary grounding in aftairs as private secretary to Lord Gower, the Brit ambas at Paris, and then as secretary to the Admiralty, took his seat in Purliament in 1796 From 1804 he held various minor offices, and in 1927 became colonial secretary and leader of the House of Commons under Goderich, and retained these positions under Wel lington, with whom, however, he presently disagreed, and from whose ininistry he then rotired. He was run over by an engine at the opening of the Manchester and Liverpool Railway on Sept 15, 1830, and died on the same day See life by J. Wright, 1831.

Huss (or Hus), John (c. 1373-1415), Bohemian religious reformer, b. at Husi nic in Bohemia Hus was the name which he adopted himself about 1396 as before then he was known as Johann Hussinees, or de Hussynees. He was educated at an element are school and the univ of Prigne, where he became B A in 1393 Bach for of Theology in 1394 and M 1 in 1396 In 1400 he was ord fined and in 1102 was in the rector of the univ of Prient. The pro Wychffe sentiments of H graduilly made him suspected of her's and his protest against the burn my of Wychffe's books by the archieshop of Pregue in 1410 caused his excommunication. His support of the king in his policy towards the papal schism made him point towards the papal senism made him execct in rls popular, and although in 1411 the whele city of I lague was laid under an interdict II still preached and carried on his duties is usual. In the following year, he were, he was obliged to quit Priene, and whilst in seclusion he wrote his D. I clessa, his greatest work. In 1414 he was summoned to attend the

JOHN HUSS

council at Constance between King Signs mind and Pope John NIII, and was in title a 'safe conduct by the former Neutheless he was in Troned soon after the council in 111, was ordered to recent ill his doctrines with were held to be far that the council in 112, was ordered to recent ill his doctrines with were held to be far tred. On his refusal he was condeuned to the stake and met a marter? de ath with exemplary fortitude on July 6 Il was a scholar of deep studition, as is preved by his Super IV Sententiarum, but he is chiefly remukable for the inspiration he gave to the cause of Boheman intronalism. His wile may be divided into four classes.

1) Hogmatical and ntto tour classes | Dogmatical and polemical, (3) executives (4) epistolary. See also Hussires, Wars or The See V Flajshams (ed.) Joannes Hus Opera Omna, 1904 See also W. Hutchinson, John (1615-64), Eng. Puritan statesman, b. at Nottingham. Educated at Nottingham and Lincoln free schools and later at Peterhouse, Cambridge. He entered Lincoln's Jun in 1637 to study law, but devoted himself rather to music and divinity. In 1643 he entered the Parliamentarian army with the rank of lieutenant-colonel, and was appointed governor of Nottingham castle and tn. In 1616 he was returned to Parliament as member for Nottinghamshire. Ho was elected member for the first two councils-of state of the Commonwealth, but with the expulsion of the Long Parliament in 1653, retired into private life. After the Restoration he was falsely accused of frea-onable conspiracy and confined to the Tower and Sandown Castle from 1662

till 1661, dying at the latter place. Hutchinson, John (1674-1737), Eng. theological writer, b. at Spennithorne, York-lare. He first served as steward to York-lare. He first served as steward to the duke of Somerset, and other families of position, but ultimately devoted him-self to religious studies. In 1724 he pub. Moses Principia (Part I.), followed in 1727 by Part II., and by many other works, including: Moses Sine Principia (1721), Power Essential and Mechanical, clory or Gravity, The Religion of Salan, etc. According to H., the Bible contained the elements of all rational philosophy as

well as of true religion. See life by Spearman in H.'s If orks, 1748-65.
Hutchinson, John (1832-1910), Scottish sculptor, b in Edinburgh. He became an academician in 1867. His prin, work consists of statues of Robert Bruce, John Kinn, Owen Victoria, the Brigger Corporate Knox, Queen Victoria, the Prince Consort,

Hutchinson, Sir Jonathan (1828-1913), Eng. surgeon, b. at Selby, Yorkshire, where he was educated, and afterwards entered St. Bartholomew's Hospital. In 1881 he was elected a member of the Royal Commission on Smallpox Hospitals, and m 1890-96 was on the Vaccination Com-mittee. In 1889 he was president of the Royal College of Surgeons. Amongst his pubs. are: Rare Diseases of the Skin (1860) A Clinical Memoir on Certain Instascs of the Eye and Ear consequent on inherited Syphilis (1863). Illustrations of (Inwal Surgery (1878), The Pedigree of Possase (1884), A Smaller Altas of Illustra-tions of Clinical Surgery (1895), and Fish-

Europe in 1553, who went out to conquer the prov. of Venezuela granted to the Welsers of Augsburg by Charles V. In 1541 he set out at the head of an expedition to seek the mythical El Dorado, and after wandering about for some years returned to Venezuela to find the viceroyalty usurped by Juan de Caravajal, who seized H. and treacherously put him to death. See Zeitung aus India Junkher

Philipps von Hutten, 1785.

Hutten, Ulrich von (1488-1523), Ger. poet and author, b. at the castle of Steckelberg, near Fulda, Hesse. He was steekelberg, near Fulld. Herse. He was the eldest son of a noble but undistinguished family and was destined by his father for the cloister, being of feeble health. He was sent to the monastery of Fulda, but greatly disliked the life there, and in 1505 fied, going first to Cologne and afterwards to Erfurt and Frankfort-on-Oder, where he took his master's degree and pub. his first noon. He want from and pub. his first poem. He went from there to Wittenberg and Leipzig, and then passed into Italy, where he was plundered in the war between Charles V. of Spain and Francis I. of France at the siege of Pavia, and later took service in the emperor's army. Later he returned to Germany and had bestowed upon him by the Emperor Maximilian the laureste crown. While in Italy H. became imbued with a hatred of the papacy, and on his return to his native land he estab. a small printing press of his own, and issued pamphlets in Ger. violently denouncing the Rom. clergy. He in turn was denounced at Rome by the Archbishop Aibert, and availed himself of the protection of Franz von sickingen, the champion of the knightly order. He was, however, soon forced to flee from the latter's castle and went to Busle, where he quarrelled with Erasmus, who did not approve of his extreme measures. From this time onwards till his death at Zürich, this time onwards till his death at Zürien, he lived a wandering life. His chief works were: Ars versificand; Nemo; Vadisumus; Epistolæ and many admirable poems in Lat. and Ger. His works were ed. by E. Bocking (1859-70). See lives by D. F. Sträus, 1858 (trans. 1874); O. Flake, 1929; and H. Holborn, 1929; also P. Kalkoff, Hutlen und die deutsche Reformation, 1920 P. Held. Hutton, Richard Holt (1826-97), Eng. journalist and critic, b. at Leeds. His best work is shown in Essays, Theological and Literary (1871), and he also wrote lives of Sir Walter Scott and Cardinal Newman. Sec J. Hogben, R. Hutton of the Spectator, 1899. Richard Holt

Huxley, Aldous, Eng. author, b. in 1894; brother of Julian Sorell Huxley (g.v.), educated at Eton and Balliol, Oxford. In 1919 he was on the staff of the Athenaum, and, later, dramatic critic for the Westminster Gazette. His early but, beyond Leda, a poem which combines gorgeous description with a frank but unexceptional interpretation of the classical myth, his poetry is mostly to be described as scientifically satirical, a method which he continued with success in his novels. The short story is perhaps his most success ful medium; but he first attracted wide attention with his movel. Antic Hay (1923), and enhanced his reputation with Point Counter Point (1928). This latter book was dramatised by another author, but the dramatic method is directly opposed the dramatic method is directly opposed to H.'s method, which is deliberately to flatten all emotion and incident to the same level, the resulting impression being that nothing is worth while in a world altogether negative. His negative philatricial will be a made of the protection. orophy limits him to a range of characters who best exemplify it, and, for this reason, his interest is brief, but always sustained by brilliance of observation, wit, and satire. He has the mocking humour of a Hogarth. Each new novel is a fresh ex-ploitation of his box of puppets; he talks to them and makes them talk to him with the most brilliant ventriloquial virtuosity in modern fiction. His earlier work was in the style of Thomas Love Peacock; but later he changed to the manuer of H. G. Wells, whose use of the novel as a forum of social ideas has done so much to transform the novel of this century. This may be illustrated by his Brave New World (1932), a brilliant satire on Utopia realised, after development according to plan by modern science, philosophy, and morality. The vision of society here depicted may be awful, yet it is assumed to be the logical result of the apotheosis tion, 1928. of latter-day ideals cultivated by machine-Hutton, James (1720-97), Scottish made humans. He has also written es-geologist, b. at Edinburgh and educated says on philosophical and social subjects.

His other works are: Limbo (1920), Leda (1920), Crome Vellow (1921), Mortal Coils (1922), Little Mexican (1924). Leda (1920), Crome Vellow (1921), Mortal Coils (1922), Little Mexican (1924), Those Barren Leaves (1925), Along the Road (1925), Two or Three Graces (1926), Sesting Pilate (1926), Proper Studies (1928), Do What You Will (1929), Brief Candles (1930), Music at Night (1931), Brave New World (1932), Beyond the Mexique Bay (1934), Eyeless in Gaza (1936), Ends and Meons (1937), After Many a Summer (1939), James Talt Black Memorial Prize for 1940, Grey Eminence (1941), The Art of Seeing (1942), Time Musi have a Stop (1944), Perennial Philosophy (1946), Science, Liberty and Peace (1941), The Jocanda Smile (play, 1948), Apes and Essence (1949); (ed.) The Letters of D. H. Lawrence (1932). See A. Honderson, Aldous Huxley, 1935.

Huxley, Julian Sorell, Eng. biologist; b. 1887; eldest son of Leonard H. (the eldest son of Thomas Henry H.). Educated at Eton (King's Scholar); Balliol College, Oxford (Brakenbury Scholar); Newdigato prizeman, 1908; first in natural science (2001cy) 1909; Naples Scholar, 1909–10. Lecturer in zoology, Balliol College, 182: 12. Research associate of Rice Institute, Houston, Texas, 1913–16. Staff-fleutenant, G.H.Q., Italy, Italy, 1913-16.

He matriculated at London Univ. in 1842, and afterwards obtained a scholarship at the Charing (ross Hospital. Here he accomplished a great deal of work, and in 1845 announced his discovery of that layor of cells in the root-sheath of her which now hears his root-sheath of hair which now bears his name. The same year he graduated M.B. in London Univ., and from 1846 to 1850 was assistant-surgeon on H.M.S. Rattlewas assistant-surgeon on H.M.S. Rattle-snake. During the voyage he devoted himself to the study of annuals, and estab. a morphological plan, dividing Hydrozoa into Radiata and Nematophora. In 1851 he was made F.R.S., became lecturer on natural hist. at the Royal School of Mines in 1854, and naturalist to the geological survey the following year. In 1855-59 he pub, works chiefly dealing with fossil forms, the most important of which are his memoirs on Cephalaspis and Picraspis (1858), the accounts of the Eurypterina (1858-59), and the description of Dicynodon, Rhamphorhynchus, and other reptiles. One of his most brilliant successes was his Theory of the Vertebrate Skull (1858), which was read before the Royal Society. In 1863 he pub. Zoological Evidences as to Man's Place in Nature, as well as On the Causes of the Phenomena of Organic Nature, both of which were widely read and discussed. In 1866 appeared his hermonary Lessons which are his memoirs on Cephalaspis In 1866 appeared his klementary Lessons in Physiology, his Manual of the Comparative Inatony of Vertebrated Animals (1871), and Elementary Buology (with Martin, 1875). In 1880 there appeared his well-known monograph The Cruyfish, which led to the introduction of this animal into elementary courses on zoology. But H.'s pubs. do not represent all his work; he also filled many important posts. He was an active member of four road: A news an active member of four total commissions, including that of the standard of the Royal Soc. ty (1833-67), resident of the Royal Soc. ty (1833-85), respector of fisheries (1851-85), and roctor of Aberdeen Univ. (1872-74). Besides

in Denmark, Holland, France, and Eng He soon developed a strong mathe matical bent and his future greatness was predicted by Descartes In 1601 he entered the lists of science, and his first essay, Eretasis quadraturas circuli, was quickly followed by Theoremata de quad ratura hyperboles clippus, et circuli. In 1655 he discovered a satclite of Satura, and in 1659, the ring of Saturn H was one of the first to apply the circulus pendulum to the construction of clocks, in 16.6 In 1690 he pub important treatises on light and weight. He also improved the telescope and developed the wave theory of high His magnum opus was the H ~logium Oscillatorium (10~3), containing innumerible original discoveries. of Carmelite friars

and preached for some time at Lyons, going from there to Paris, where he attracted great crowds at the churches of St. Sulpice and Notre Dame. In 1869 h, was suspended on a charge of indiscipline, but obtained a di pensation from his monastic vows and became l'Abbé Loyson. In 1871 he became as member of the Old Catholic Congress at Geneva, and the following year he married in London. In 1879 he In 1879 he estab, a Gallican congregation at Paris, cettab, a Gamean congregation at Paris, having resigned his emicey in the Old Catholic Church at Geneva some years previously. See J. A. F. Puaux, Le Pire Hyperinthe et som Eglise; and L. W. Bacon, Father Hyperinthe, 1871.

Hyacinthus, in anet. mythology, the youngest son of the Spartan king Amyelas and Diomede; a youth of extraordinary beauty, beloved of Apollo and Zephyrus (Boreas). He returned the love of the former, but was indifferent to the latter, of Apollo against the head of II. when they were playing quotis. The youth was killed by the blow, and from his blood there sprang the flower of the same name (hyacinth). H. was worshipped at Amy che as a hero, and the Hyacinthia, the second most important of Spartan testivals, was held in his honour.

Hyades (Gk. 'Yaha, the rainy), in Gk. mythology, were seven uymphs who were supposed to have nursed and protected Dionysus, and for their reward were placed in the constellation of the Bull. Their name is probably derived from the fact that their beliacal rising foretold wet

Hymna, name applied to the species of carnivorous mammals belonging to the family Hywnidae, which range over Africa and Asia. They are massive animals, catlike in appearance, with coarse, shaggy fur marked with irregular vertical stripes or large black spots; there are generally four toes furnished with non-retractile claws; the hind limbs are shorter than the H. Euro-Amer. vine, which is more the fore, which adds to the ungainlines capable of resisting l'hylloxera than cither of their movements. The only living of its parents; Prof. Biffen at Cambridge

its numerous varieties, is a favourite genus is Hyana, whose species are mainly cultivated plant of the springtime, and carrion-eaters; they produce a wailing, almost human-sounding, how and are the subject of many superstitions. H. crosubject of many superstitions. H. cro-cuta, the spotted H., is limited to S. Africa, cuta, the spotted H., is limited to S. Africa, and H. striata, a striped species, is found in N. Africa and S. Asia. Proteics cristatus, the aard wolf of S. Africa, is sometimes included in this family. Hyana Dog, or Cape Hunting-dog, name given to Lycaon pictus, a species of carnivorous mammals belonging to the Canide and ranging over a portion of S. Africa.

Africa.

Hyastan, sec ARMENIA.

Hybla, name of three anct. Sicilian cities: (1) Hybla Major, situated on the S. slope of Mt. Etna. (2) Hybla, called the Little, and called Megara from the fact that the latter was built on nearly the same spot. (3) Hybla Herwa, on the route from Agrigentum to Syracuse. The famous Hyblaran honey was obtained from one of these tns.

Hybrid (Lat. hybrida, a cross-breed or mongrel) progeny of two distinct varieties, as in the mongrel; of two distinct species, the common acceptance of the term; or, much more rarely, of two different genera. Faily myestigators declared that Hs. were sterile, but Darwin's experiments clearly demonstrated that this is not always so. as he was able to rear healthy young from a pair of Hs, between the domestic goose and the Chinese goose, which represent distinct species. The production of Hs. does not appear to be possible between whele differing parents. In the animal kingdom many variety-Hs, have been obtained, and rather less species-Hs, torus-Hs, are rare, though the he-goat and ewe have been successfully crossed, as also have the star-fish and sea-urchin. In the case of species, possibly the com-monest examples are the production of the mule from the male ass and mare, and of the hinny from the horse and female ass: other examples occur in the case of who, realous of his rival, drove the discus. The dog and fox; lion and fix r; hare and of Apollo against the head of II, when I didit; canaries and finches, etc. Hybridthey were playing quots. The youth was lish is spoken of by Biola as being (a) natural, when it occurs in the undisturbed in tural conditions (the relatively few cases of this quoted are open to suspicion); (b) incited, when it is under direct human control; and (c) artificial, as in the mixing of the male elements with eggs, as in the mixing of the male elements with eggs, as in the case of fish and frogs. Hybridism has become of importance to florists, in the production of new varieties of garden plants, and their successful experiments date back to the seventeenth century. Gamus-Hs., which are rare, occur, as in the rhododendron, orchid, and azalea. The other forms are more common. Graft hybridism has been chronicled, as in the case of Adam's laburoum, and in the bizzarra from the bitter orange and citron. t shally Hs. resemble one parent more than the other, and generally they do not breed true (see BREFDING and HEREDITY). In many cases the hybridisation results in definite economic gain, as in the case of the H. Euro-Amer. vine, which is more capable of resisting Phylloxera than either

it. Alexander, under cover of a stormy night, effected a landing on an is. in the riv., and therefrom advanced to the opposite bank and casily defeated the cavalry and chariots of Porus. Historians agree that the latter was of such huge stature that though he rode a very large elephant, 'he appeared but proportionably mounted.' This elephant gave extraordinary proof of sagarity and care of the king's person throughout the battle; but though them was defected and care. but though Porus was defeated and captured, Alexander not only restored to him his dominions, but made him his lieutenant over them and over large accessions to them from the ters. of conquered free peoples. According to Plutarch, it is on the authority of Onesieritus that Alexander is said, when coming to land on the slippery and treacherous riv. bank, to have uttered the famous observation, 'Will you believe, my Athenian friends, what dangers I undergo to have you the berald of my fame ' See also under JHELUM.

JHELUM.

Hydaspes, see JHELUM.

Hydatid Disease, Hydatid Cyst, or Echinococcus Disease (Gk. vbaru, a watery vesicle). Certain immature forms of tape-worms—in particular of Tænia echinococcus—are sometimes present in the body, and it is from these that a H.C. arises. Cysts are formed and the brain, liver, lungs, and kidneys are liable to this disease. The cyst may vary in size from the size of a bazel nut to that of a child's head; and the danger depends upon the head: and the danger depends upon the size and position of the cyst. The disease can only be treated surgically. H. arises in man through days being kept too much about a person, for the adult worm, being small, lives socially in the intestines of the dog, lackal, and wolf. Man becomes infected by eating food contaminated with animal facces in which are the egg- of the tapeworm. The H.C. is the immature stage (cysticercus) of the worm. The disease is most prevalent in Iceland, although it is found in most European countries. See TAPEWORMS and BLADDER WORMS.

Hyde, municipal bor. in the co. of Cheshire, Eug., about 4 m. N.E. of Stockport. Its prin. industry is the manuf. of cotton goods, but coal mining and engineering are also carried on. Pop.

was similarly able to produce H. wheats which combined good cropping qualities with resistance to attack by the 'rust' rungus.

Hydaspes, Battle of, fought between Alexander the Great and Porus, an Indian king, whose dominions lay between the Indus and the H. The date is given as about 326 n.c. and from the graphic account of it in Plutarch we learn that our knowledge of the details comes from the letters of Alexander. According to these, the R. H. was between the opposed forces, and Porus drew up his elephants on the banks opposite the Macedonians, with their heads towards the stream to guard it. Alexander, under cover of a stormy 1937. Became the first president of Eire, 1937. Became the first president of Eire, being chosen by agreement between the Flanna Fail and Fine Gael political parties as a non-party man, in 1938. He was a protestant.

Hyde, Edward, see CLARENDON, EARL

Hyde, Thomas (1636-1703), Eng. Orientalist, a native of Billingeley in Shropshire. He was a student at Cambridge, and in 1658 became Heb. lecturer at Queen's College, Oxford, afterwards chief ibrarian at the Bodleian Library. He was also made canon of Salisbury and archdeacon of Gloucester, and eventually canon of Christ Church. He helped Walton with the Persian and Syriac texts of the Polyglot Bible, and wrote Historia Religious Veterum Persarum (1700).

Hyde Park, enclosed space of about Hyde Park, enclosed space of about 360 acs., situated between Piccadilly and Kensington, London. It belonged originally to the manor of Hyde, the property of the Abbey of Westminster, but was appropriated by Henry VIII. after the dissolution of the injunisteries, and is now a royal park. In times gone by duels were fought here, but in the seventeenthy if here as mentioned as century it became a meeting-place of fashionable people, and during the London season is still used for this purpose. It is also a favourite place for various political meetings. Among its points of interest may be mentioned the Murble Arch, now isolated from it; the Gateway at Hyde Fark Corner; the Serpentine, a lake formed on the course of the Westbourne R.; and Rotten Row, the famous riding track Ken-ineton the famous riding track. Kensington Gardens adjoin H. P. on the W. Hyderabad: (1) Prin. native state of

India, and occupies a large portion of the Decean, the central plateau of S. India. It is also called the Nizam's Dominions, and has an area of 82,313 sq. m. The Nizam of li. is the chief Moslem ruler in

India.

H. Is very mountainous and densely wooded in some parts, whilst in other dists, it is flat or undulating. Vast areas are almost uninhabited. There are two prin. tracts called Jelingana and Marsthwala. The chief rivs. watering the dist, are the Godavari, Dudna, Manjira, Pranhita, Wardha, and Kistna, with their tribs. The chief products are oil seeds, rice, cotton, and the sugar cane. The total area under cotton exceeds three million acs. There are large cotton mills, and a number of tanneries and flour mills. 32,000.

Hyde, Douglas (1860-1949), Irlah total area under cotton exceeds three cholar, linguist, and writer, known as 'an million acs. There are large cotton mills, Craoibhin Aoibhinu,' b. at Frenchpark, co.

There are seven art colleges and three professional colleges. The mineral wealth of the country is indifferent, but there is a huge coal mine at Singarent. Pop. 16,338,500, of whom 13,000,000 are Hindus.

History .- Moslem rule and traditions in H. have their remote origins in the Muslim conquest of the Decean 700 years ago; in the foundation of II., the cap. of the State, in 1589, by Kutáb Sháh Muhammad Kuli, a descendant of Sultán Kuli Kutáb Shah, founder of the dynasty at Golconda in 1512; and in the estab-of the present Asaf Jahl dynasty in H. in 1713, when Kamr-ud-din Asaf Jah, a distinguished soldler of the Emperor Aurungzebe, was made Nizam-ul-mulk ('Regulator of the State') and Sulahdar of the Decean (but, later, secured his in-dependence of the Delhi court). After the death of Asaf the right of succession to his power and authority was disputed by his descendants, the Eng. and Fr. supporting rival claimants in the struggle to promote their own influence in the Deccan; but clive's victories compelled the kr. to withdraw from the support of Salabat Jang, who was dethround and murdered by his brother \ :n Ali (1761). Ali afterwards deviatated the Carnatte (1765) but retreated before the Brit. The Brit. Gov., however, compromised with Ali because they wanted his assistance against Hydar Ali (q.r.), and a treaty was concluded with the Nizam in 1766. In 1790 the Brit. Gov. concluded a mili-tary alliance with the Nizam in the war with Tippoo, son of Haidar Ali, and Tippoo had to buy peace at the price of half his realm, which was assigned to the Nizam. On the capture of Seringapatam and the death of Tippeo, the Nizam's dominion-were still further augmented. The Nizam come under the protection of the Brit. Gov. in 1799. In 1857, with the outbreak of the Indian Mutiny, the state of H. and the Nizau's dominious became official. An attack on the Brit scale. critical. An attack on the Brit, residency was repulsed by the H. contingent, who displayed all their wonted loyalty to the displayed an their wonded toyarty to the Brit. connection; and in 1860 a new treaty was made by which the Nizaurters, were further enlarged so as to be cotorninous with H. In 1902, in a treaty made by Lord Curzon, the dist. of Berar was assigned in perpetuity to Great Britain and the H. contingent was incorporated into the Brit. arms. The N. thus became the prin. Moslem ruler in India.

The long and bitter controversy over the long and long and bitter controversy over the long and long and bitter controversy over the long and long and

justification from the fact that Hindus constitute 85 per cent of a total pop. of seventeen million. In theory the Indian Union had a valid case on both heads, although the Nizam claimed that he was repeatedly assured by the Brit. Gov. that repeatedly assured by the Brit. Gov. that he would be at liberty to choose whether to accede or remain independent, and it seems evident that H. was deserted by Brituin when she transferred power to Indian hands, leaving the Nizam's gov. to fend for itself against the rising tide of Congress sentiment. By early 1948 all the other Indian States had been induced to proceed to the Union. dured to accede to the Union; only H., the premier principality, remained aloof and defaut. When in June 1947, it was known that India was to be partitioned the Nizam amounced in a firman that be did not intend to accede to either India or Pakistan but would preserve his independence. This was the signal for the launching of a civil resistance movement by the H. State Congress, a movement sponsored by the Indian National Congress; but after some thousands of arrests had been made many leaders of the State Congress fled to adjacent Union ter., while their president conducted a propaganda tour of India. A still more propaganda tour of India. A still more dangerous challenge to authority came from the communists acting chiefly from adjacent areas of N. Madras, where they were disrupting the Nizam's regime. Local Mushins in H. banded themselves together to resist communist raiders. This was the origin of the Ruzakar or volunteer movement—which soon became a thorn in the side of the Indian Nationalists, for they were in effect the private army of the Moslem party in H. Actually started in the spring of 1947, the 'Association for the Unity of Moslems' (Vajlis i-Ittehad-cl-Muschnin) became the monthipped of militant Islandic elements mouthpiece of militant Islamic elements and much the most influential party in the State. They regarded themselves as the champions of the Nizam against both (ongress and communists. Accordations between the Indian Gov. and the Nizam went on slowly and by Nov. (1947) an agreement on the terms of accession had been drafted, but it was abruptly dropped under vehoment pressure from the Itte-had. The most that was agreed on was a 'standstill agreement' for a year, during which the Nizam retained internal autonomy but entrusted the control of foreign relations to India. In the meantime the Nizam undertook to frame a more liberal and progressive constitution and intro-duce a number of limid ministers into his Administration. But hopes of settle-ment faded in face of the hostility of the Razakars. In June 1948 the Nizam sent a former premier, Sir Micza Ismail, to negotiate fresh terms at Delhi; but a draft agreement was rejected by the Nizam, again at the instance of the Itte-had or Razakars. The Indian Gov. there-upon decided that no agreement could be hoped for until the influence of the Moslem militants had been offset, and thereupon called on the Nizam to allow Indian troops to return to the camp at and progressive constitution and intro-

withdrawn (Nov. 1947) after the standstill windrawn (Nov. 1947) after the standard agreement. This request too, was rejected. Thus the long wrangle between the Gove of India and H. came at last (Sept. 1948) to a decision by force of arms Indian troops entered H. on Sept. 13. The invadors, moving from all quarters of the convention of the standard of the convention of the conve of the compass, had soon advanced deep into H meeting with some opposition from the Razakars Meanwhile the H Gov appealed to the Security Council of the United Nations but there were juri dical on tacles to the hearing of the case of a non member of the laited lations, and in an case the appeal was tool te By Sept 1) the invalon had a neved its purpose the Indian column commander receiving the form a surrender of the H army at a point near Secuncer ib 1 and soon afterwards Indian tr apsenter Itait for this howed that it hid no in tention of reposing the Nizan or cf How of light showed that it had no intention of (epishing the Nizam of of ending his dynasty it spite of popular clamons for this in 191) the Nizam transferred to the state (soy about 7000 sq m of limit (about one tenth of the state) which he held as his personal property (2) Name of the cap of the above state is situated on the 1 b of the above state 13 situit d on the 1 D of the R Musi and is the epith largest city in India. Hydra (and Hydrea), is in the Grecian Arcmpel up off the coast of Morea, form ing with the neighbouring 19, of Dokos the bay of 11 It has an area of about 21 sq in and its greatest length is 11 m Its surface consists of barren rocks, only

and shipbuilding The Hydriots were re-nowned seafaters and traders in the past their business leading them to the Baltic Pop and the Americas (is.) 3700 ,

(tn.) 3000.

Hydra, or 'The Water-Snake' one of the old constellations, being mentioned by both Aratus and Ptolemy From the time of the former it has always been a triple figure a long snake, represented as trailing upon the ground, bears upon his back a cup (Crater), and near to his tail seated a crow (Corvus) The mytho logical meaning is altogether unknown Hydra must be distinguished from Hydrus the S Snake, a s constellation of Lacaille which is situated between the bright star Achernar and the '. pole

Hydracids are acids which consist of hydrogen united to an element or group of elements which do not contain oxygen Hydrochloric acid (HCl) and hydrocyanic acid (HCN) are examples of H. Oxyacids. on the other hand may be regarded as compounds of water with a non metallic oxide, e g sulphuric acid (H₂SO₄ = H₂O₇)

Hydragogues, see under APFRIENTS
Hydrangea, genus of Sanitagaceae,
contains the it is dozen species which
flourish in N lands. Flice are hardy
flowering shrubs with opposite leaves and some are of a chinbing habit they re quire a rich loam soil which should be well drained but not dry Only in favoured situations in warm parts of the country will they remain out of doors all the winter in safety. They are useful shrubs to grow In tubs or pots the commonest example found in Britain being the birtensia (II hortensis) or luccaps, which is a favour ite plant for hotel longes. When in full bloom He are covered by numerous large owning covering of brightly coloured flowers. White blac, rose are the more usual colours, and will change from season to season on the same plant if alum or cop per is dissolved in the water in order to change its colour. Blue flowers may also be obtained by artificial treatment. Some Blue flowers may also kinds of H grow to 10 ft high but the more usually cultivated kinds are alout three or four ft high H macrophylla is a very good garden plant with superb massed colour cheets. They have a flat flower head like that of the wild gue der nower field inciting of the wind grader rose of their varieties are the handsome white macroscipala, the pink Marient and the varieties of woodland II (II strata), such as 'gris-wood,' with beautifully shaped flowers that open white and turn crimson, and H acuminata, with attractive blue flower
Hydrant, see WATER SUPPLY.

Hydrate, term applied to compounds of water with other compounds (or, more rarely, with elements) The water is usually loosely held, and may be driven off by heat or by the action of dehy drating agents such as concentrated sulphunc acid, it is known as under of hydratum or

The Hydriots were re- | hydrate, Na CO , 10 H O. When the water and traders in the past | of crystallisation is driven off from hydrated crystals, the crystalline form is lost, and the resulting powder is known as the anhydrous form of the substance. The colour of the hydrated substance is frequently different from that of the anhydrous; thus copper sulphate pentahydrate is blue, while anhydrous copper sulphate is white. The term is about sulphate is white The term H should not be confused with the somewhat

Hind is commoca with the similar term Hydroxide (q 1)

Hydrauhe Machinery includes all those machines which depend upon water power, and the similar term of the simil They may be divided into two classes
(1) Motor machinery and (2) pumps.
Water falling from a high to a low level
can obviously be used to drive machines, which are thus deriving their energy from water, and these are typical of the first class. The second class would include steam pumps for raising water from a low to a high kivel, or from a low to a high pressure. Thus under the term H. M. are included sev branches of engineering and these branches are dealt with separately (see Accumulator, BRAKE, CRANE, HYDRATTIC PRESS, HYDROKINETICS LIPS, PUMPS TURBINES depend upon Most by distulic max hines depend upon

the I rinciples explained in hydrodynamics and typified by the hydraulic press (q v), while Lord Armstrong's hydraulic accumulat it (see Accumentation) estab the succos of storage and power transmission machinery Pipes for carrying water under pressure are made of cast Iron or sticl, and the thickness and diameter vary with the average pressure of the water trusmitted. A 6 in pipe 11 in thick, will carry water at 7:0 lb per eq in 18 Pripresent the pressure of water in lb. 1ct sq in, d the internal diameter of the pic then the thickings of the pipe can be also before the property of the pipe can be also before the property of the pipe can be also before the property of the pipe can be also before the pipe can be presented from the formula.

t = 0 000125 Pd + x

calculated from the formula

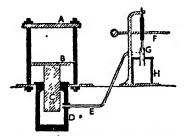

where t equals thickness of the pipe, and r=0.37 in for pipes less that 12 in, in equal ter, $0 \rightarrow \text{in}$ for pipes t = 1.2 to 0 in and 0 6 in for pipes 1 im 30 to

Hydraulic power is utilised in many was because of its corvenience for a islonal use, and of its freedom from er oke and noise, its capability of being trusmitted and used without any attentun and also because of its practical free dom from danger

Hydraulicking see under MINING Hydraulio Press, invented by Joseph Bramah (q t) in 1789, and therefore known as Bramah press. The prinon le used in this machine is a well known one in hydrostatics (qr), viz that a pressure on any put of the surface of any hand is transmitted equally in all directions through the n 154

as will be seen from the accompanying dugram, a free pump G can force water from the tank H, by way of a strong pipe F into a strong cast steel cylinder D (', salts are Hs., thus line vitriol or copper sulphate (rystall consist of copper sulphate (rystall consist of copper sulphate (rystall consist of copper sulphate pentahydrate, CuSO₃,5H₂O, while between which and the plate A—somewashing soda is sodium carbonate deca

thing, e.g. a bale or a number of books, can be pressed. The power of the press is calculated as follows: Let D and D, be the diameters of the pump plunger G and

BRAMAH'S OR HYDRAULIC PRESS

the ram C respectively. Then, if W be the force exerted on the pump, $W_1 \frac{1}{12^3}$ will be the force exerted by the ram. As an example: if a force of 50 lb.-wt. be exerted on the pump plunger of diameter 1 in., then, if the diameter of the ram be 10 in., the force exerted will be $50 \times \frac{10^3}{1^2} = 5000$ lb.-wt. It is thus a very efficient machine, and it is used for pressing cotton and wood bules, bending iron plates, lifting weights, and raising bridge girders into place (hydraulic jacks); the pump G being either worked by hand by a lever F as shown, or by a steam engine.

as snown, or by a steam engine.

Hydrauiio Ram, see Pumps.

Hydrauiio (H.N-NH.), colourless strongly alkaline liquid (boiling point 114°C.), obtained by heating H. hydrate with barium oxide. Its salts are prepared from anmonia and hypochlorite; if the product is evaporated with sulphuric acid the sparingly soluble sulphate separates out. H. forms many derivatives in which hydrogen is replaced by alkyl groups, the most important being phenyl H. (C.H., NH NH 1), an oily liquid, which forms crystalline compounds with aldehyde, and ketones.

Hydrazorio Acid, or Azoimide (NH·N₂), poisonous, highly explosive liquid made by acting on hydrazine with nitric acid. Its lead salt, lead azide, has replaced mercury fulminate as a detonator.

Hydrea, see HYDRA.

Hydrides, compounds containing hydrogen, combined with a single other element, but the term is generally restricted to such compounds where the clement is a metal. Thus H 10 and HCl would be regarded as oxide and chloride, respectively, rather than as H. Compounds of hydrogen with metals such as arenic, antimony, sodium, calcium, etc. (Asil, SbH, Na, H, Cail, mapportively), may be regarded as true H. in the limited sense of the term. With acids or water H. evolve hydrogen, use having been made of this in the preparation of the gas for military balloons.

Hydriodic Acid, or Hydrogen Iodide (III), colourless gas, funing strongly in moist air, and easily soluble in water to a solution, which when saturated has a sp. gr. of 1-70, and contains about 52 percent of HI. Light turns it brown with deposition of iodine. It may be obtained by distilling potassium iodide with phosphoric acid, but is more easily prepared by acting on red phosphorus and iodine with water, or by pa-sing hydrogen sulphide into water containing iodine in suspension. On heating, H. A. is decomposed into its elements. The saits of H. A., the iodides, are crystalline, and as a rule soluble in water. Silver iodide is used in photography, and pota-sium iodide in medicine to lessen secretous and absorb the products of inflammation.

Hydrobromic Acid, or Hydrogen Brounde (Hir), colourless, funing gas with a pungent smell, forming a funing acid. In the presence of light it is decomposed with separation of bromide, H. A. is formed by the action of phosphone acid on potassium bromide; it is most conveniently prepared, however, by dropping bromine on to a paste of red phosphones and water, the gas evolved being passed into water. The bromides, or salts, derived from the acid are crystaline, and, as a rule, soluble in water. They are employed in photography, silver bromide being one of the most important salts that are sensitive to light. Potassium, sodium, and ammonium bromides are also used in medicine, and act as powerful hypnotics and depressants. If taken habitually they are apt to set up a variety of nonsoning known as 'bromism.'

Hydrocarbons, compounds of hydrogen with carbon, may be regarded as the parent substances of all organic compounds. There are many classes of H., of which the following are the most important: (1) the paraffins, of general formula C_pH_{n+1}, which are 'saturated' compounds, with the carbon atoms in an open or a branched chain; (2) 'unsaturated' H. of the cthylene, acetylene, and other series, which will unite with elements, such as chlorine or bromine, without undergoing rearrangement of the molecule; (3) H. containing a ring structure, such as benzone, naphthalene, anthracene, in which the carbon atoms are arranged in one or more closed rings. Combination of the above types is possible, giving rise to an enormous number of H., derivatives of many of them being found in nature. Petroleum and other nuneral oils consist almost entirely of H., there of the parallin series being usually the most plentiful.

Hydrocele, dropsy of the serous membrane surrounding the testis. It may occur as the result of inflammation, or from a blow, but its cases is usually unknown. It can be distinguished from other disorders in the same position by reason of the fact that when the tumour is held between the observer and the light it is seen to be translucent. It can be distinguished from rupture since it gives no impulse when the sufferer coughs. It

usually occurs in middle age, in persons of | general and about fifty species. weak power or with tendency to gout. It does occur in children either as described above or as congenital hydrocele.

Palliative treatment consists in using susponding bandages and tapping frequently. The eurative treatment consists in setting up inflammation by injecting iodine, or by excision of the whole or part of the sac. Injection of chloride of zinc is sometimes used, as causing no pain or inflammation.

Hydrocephalus, see under DROPSY.

Hydrocephalus, means, literally, 'water on the brain,' but includes three distinct discases:

(1) Acute hydrocephalus, or rather tubercular managitis, is due to inflammation of the membranes of the brain because of the presence of tubercles (q.r.). Fluid frequently forms within the brain, and it is a fatal di-case, which is common in childhood, although it does occur less

frequently among adults.

(2) Chronic hydrocephalus is distinct from acute II., since it is a dropsy. A watery fluid forms in the skull, before the bones have united to form the brain case, and by pressing outwards it increases the size of the head on Lausly by forcing the bones apart. This may commence before birth, but is more usual in early childhood. It has been known to occur childhood. It has been known to occur at about the cighth or ninth year, and the fontanciles (gaps between the bones on top of the head) and sutures have been forced open under the pressure. If they do not yield, death quekly results. Fluid also collects within the brain (in the ventricles) causing the cerebral homs-pheres to swell and their convolutions to become fluttened. Children suffering from II. usually die in infancy; some may survive, but they carry their complaint with them through life. Not a few cases of blindness, deafness, palsy, and idiocy are due to this, although the sufferer is not always so affected. Since the skull enlarges and the face only grows at the usual rate, cases can be diagnosed by the dis-proportion between the head and face which ensue. Not much can be done in the way of treatment, though attempts are sometimes made to tap off the fluid Occasionally the disease attacks adults, as in the instance of Dean Swift, who

as in the instance of Dean Swift, who succumbed to it.

(3) Sparious hydrorephalus resembles acuto H., and is often mistaken for it. It is, however, due to a poor supply of blood to the brain, and is a disease of debility. As a result of this disease, the little patient will have a pale, cool cheek, half-abut, regardless eyo, interrupted, sighing respiration, and an unclosed fontanelle. It can be distinguished from acute H. by the fact that in acute H. the surface of the fontanelle will be convex, while in spurious H. it will be coneave or depressed because it lacks support and

as water-plants in tropical and temperate lands, and a few are marine; they usually mnabit ditches, lakes, and rive. Nearly all have ribbon-like, submerged leaves, and some have floating leaves; the male and female flowers usually occur on different plants. They are generally in parts of three, with a two-whorled perianth; the stamens are in from one to five whorls: the carpels form an inferior ovary, are united, and vary in number from two to fifteen the ovary is unilocular, with numerous ovules. The chief genera are Vallisuria, Eloda (E. canadensis, Canadian Pondwed, a very common submerged plant in Great Britain; other species are often grown in tropical aquana), Hydrocharis (II. morsus-ranae is the Frogbit, with kidney-shaped leaves, all floating in the water surface) and Halophila.

Hydrochloric Acid, or Hydrogen Chloride (HCl), colourless gas, closely resemb-ling hydrobromic and hydriodic acids. It is readily soluble in water to a funding, strongly and solution, which is known under the name of 'spirits of salt.' H. A. is formed by the direct union of hydrogen and chlorine, but is most conveniently obtained on a small scale by heating common salt with sulphuric acid, thus

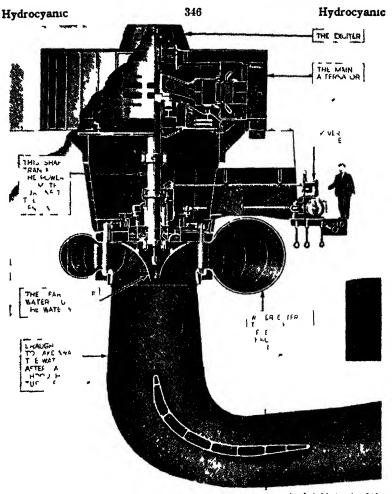

NACI + H.SO. = NaHSO. + HCl.

the acid sodium sulphate formed being capable of decomposing another molecule of salt at a high temp. thus:

$$NaHSO_4 + NaCl = Na_5O_4 - HOL$$

A concentrated aqueous solution of H. A. has a sp. gr. of 1.2, and contains nearly 40 per cent of the pure acid. The acid is very stable, being unaffected by heat or light; with many metals it reacts with theration of hydrogen, the chloride of the metal being formed. In the presence of intre acid, manganese dioxide, and other oxiding agents, chlorine is produced. The chlorides, or salts of Il. A., are, as a rule (exceptions: silver, lead, and mor-curous chlorides), soluble substances. common salt, or sodium chloride (NaCl), is the most important of the chlorides, and is the substance from which all chlorine-containing (ompounds, such as bleathing powder, potassium chlorate, etc. are prepared. If A. 18 largely used as a cleaning and scouring agent for metals, e.g. from before galvanising, etc., and in the dyestims industry. Common salt is used as a preservative, and is a necessary article of food with all animals hung on a vegetable det. Medicinally, it is used internally as an emetic, externally in baths for the relief of scistica, rheumatism. etc.; and it is injected, in solu-tion, to replace loss of blood.

surface of the foliable will be convex, while in spurious H. it will be coneave or depressed because it lacks support and originates in emptiness. Spurious H. fracinorphous rodents belonging to the readily yields to treatment, by means of spurious H. family Cavidee, and consisting of a single spurious fields, and attains a length of 1 or 5 ft. It is aquatic, having webbed digits furnished with hoof-like mails, and is a native of S. America.

That 'water costs nothing ' is of course

Any water-power developa fallacy. ment requires considerable civil engineering works, reservoir, dain, conduits, and riv. regulation, besides power-house and machinery, and to this must usually be added the cost of water rights (fishing, timber flotation) and land. But the cost consists mainly in charges against capital, interest, depreciation, taxes, and insur-ance. And the life of a hydro-power installation is generally longer than that of a thermal power station: reservoir, dam and conduits are practically permanent, and the cost of operation and maintenance of a hydro-power station is

The total power that can be obtained from a waterflow of q cub. ft./sec. with a drop ('head') of h it. is 62-4qh/550 h.p., and if the efficiency of the turbine is n, the power at the turbine shaft is 62-1 qqh/ 550 = 0.1135 qph h.p. core-ponding to an ann. output of 732 qph kWh. Investigations preliminary to a hydroelectric project involve determination of the flow and the head that are or can be made available. The actual flow in a stream is best measured by erecting a weir across the stream, but where this is impracticable, the cross-section is measured and the velocity is obtained with a current-meter, by floats or by injection of colouring matter or a chemical litto the water (see Waffer Measure Measure Measure according to the season and from year to year and depends on the discharge from the catchment area. This untimately depends on the precipitation and is affected by the topography and geology of the area, the topography and geology of the area, the vegetation, the climate, and the character of precipitation, whether heavy or gentle showers, raiv, snow or hail. Careful examination of these factors, and especially of seasonal and ann. variation of meteorological data, maxima and minima of precipitation, probable frequency and duration of dry and wet periods, flood conditions and occurrence of ice, is essential. The effect of dry periods was strikingly illustrated by the depiction of the water storage in sweden, following the drought of 1946-17, which forced the authorities to introduce strict rationing of power in 1918.

The final project depends on the natural conditions, and thus no two hydro-power developments are exactly alike; roughly, two main types may be distin-guished: (1) high-head schemes characteri-tie of mountainous countries, utilising a head of 500-5000 ft., and (2) low-head schemes of 2-100 ft. The latter use reaction turbines, sometimes submerged. Pelton wheels are used for head; above 500 ft., though the modern tendency is turbines up to 1000 ft. Intermediate schemes use either Pelton wheels or turbines, according to the quantity of water. The highest head so far utilised (5700 ft.) is at Chandolin in the Rhône valley (Switzerland), with 5 Pelton wheels of 42,500 h.p. the employment of reaction up to 1000 ft. Intermediate kowards

The power that can be supplied continuously is determined by the minimum flow. If it is feusible to shut down at least some of the turbines during the hours when demand is low, the water so saved may be impounded for use during high-load hours. This is called 'pondage' as distinguished from 'storage' of water during seasons or longer periods of increased flow, which demands a large reservoir. Where no take or other natural streams is a valuable floading of according storage is available, flooding of a considerable area is necessary. Storage is characteristic of high-head schemes. In a low-head development where large quantities of water are involved, adequate flooding is too costly. The quantity of water obtainable by storage is determined from run-off records over a number of years; the longer the record, the more reliable are the final figures. Successive monthly run-off values are added cumulatively and the results plotted as a masscurve against time, or tabulated values may be used in a step-by-step method for calculating debits and credits. The tinul choice of reservoir size is dictated by the cost of land and the output required of the power station as a component of the network.

Almost every hydro-power scheme requires a dam, to close the reservoir or as a means of forming or increasing the head as part of the intake to the turbines. Gravity dains, built of timber, earth or rock-fill, or concrete, rest on a wide base and the weight of the dam alone is sufficient to give stability. Buttersed or hol-low dams of reinforced concrete slope at 45° on the up-stream and the water pressure ensures stability. Arched dams are usual in narrow goiges. The recently completed Lumitei dain in Italy has both horizontal and vertical curvature.

In bigh-head stations the reservoir is often at a considerable di tance from the power house, and the water is conveyed from the intake to a convenient point on the hillside above the power-house in a conduit which may be an open canal, a conduit which hay no im open canal, a finne, a tunnel, or a pipeline, but generally following a level curve. The conduit leads into the forebay from which the pendock, a group of steep pipe-lines, convey the water to the turbines. At the lead in from the penstock to the tuchme gates a vertical surge tank is often provided to relieve pressure variations in the penstock caused by sudden opening or closing of the turbine gates. The condut leading out of the power-house is known as the tail race. In low-head power schemes the power-house is usually adjacent to or built into the dam.

Hydraute Turbines are either of the

impulse type, of which the Pelton wheel is the only design in actual use, or the Is the only design in actual use, or the reaction type, such as the Francis or the Kaplan turbine. In the Pelton wheel the water issues from a nozzle at the velocity v, theoretically = $\sqrt{2yh}$ ft./sec. gained by falling through the head h ft., in actual practice multiplied by a coefficient (about '99) dependent on the shape of the nozzle. The kinetic energy of the jet is $\frac{1}{4}mv$, where m is the mass of water, and if the cross-section of the jet is gives rise to eddy formation with consess sq. ft. the mass issuing per sec. is $S \times g$ and the h.p. of the jet is small plants. In modern plants of larger state the guide vanes are pivoted and their state the guide vanes are pivoted and their samples of the guide vanes are pivoted and the guide vanes are pivoted and their samples of the guide vanes are pivoted and their samples of the guide vanes are pivoted and the guide vanes are guide vanes are pivoted and the guide vanes are guide

best cross-section of the jet is circular, and the largest practicable diameter is 8 in., giving a cross-sectional area of about 1/3 sq. ft. The quantity of water that can be used is therefore limited, and the Pelton wheel is best suited to high-head schemes. The jet impinges on buckets fixed on the rim of the wheel and thus provides the driving force. As a rule, only one noz/le per wheel is used, although in some cases two nozzies at an angular distance of 90° from one another have been used, whereby the power is, theoretically, doubled, though the efficience is dicreased by interference between one jet and the splad of the other. The nozzie carries an axial 'needle' which is used for regulation of the jet or for closing the nozzle, in a way similar to that of a needle valve. Speed-regulation of modern Polton wheels is effected by deflection of the jet or, as this method is wasteful, by come 'needle regulation and deflection, the needle and deflecton being operated by the governor mechanism. Pelton wheels are usually mounted on a horizontal axis as this arrangement to the strength of the strength.

is the simplost. In the reaction turbines, water enters the runner along the whole circumference through a series of guide vanes so shaped that no shock or eddy formation occurs on passing into the vanes of the runner. The driving force on the runner derives partly from the pressure of the water, partly from the reaction on the runner vanes due to the change in direction of the velocity of the water. By discharging the water through a draft or suction tube, the full pressure can be utilised, even if the turbine is mounted at some distance above the full-race level so as to give easy access for inspection and repair. The carliest reaction turbine was the Fourneyron outward-flow turbine, in which the runner surrounded the fixed who the faller forval turbine was of the axial-the type, the guide vanes being placed above the runner, with axial discharge. The Francis turbine is of the inward-flow type, the fixed guide vanes surrounding the runner, but in the modern designs, the runner is tapering downward and the flow is gradually turned in the axial direction. The Kaplan turbine is an axial-flow type, the runner being shaped like the impeller of a centrifugal with only a few (3-6) yames. The guide vanes of a reaction turbine are surrounded by a spiral volute chamber for delivering the water at an uniform rate around the circumference. This chamber is sometimes (in low-head installations) moulded in the concrete of the foundation. For higher heads (> 100 ft.) a steel casing is used. Speed regulation may be effected by a cylinder gate inserted between the guide vanes and the runner and slided

gives rise to eddy formation with consequent loss of efficiency and is only used in small plants. In modern plants of larger size the guide vanes are pivoted and their angular position is regulated by the governor. In Kaplan turbines the pitch of the blades of the runner is regulated. Large reaction turbines are usually mounted on a vertical axis. If the unit is placed in the torobay, the shaft rests and turns on a submerged lignum vitae heating pad. In larger units the runner and generator rotor are suspended from a thirst bearing sometimes mounted above the generator. The design of a bearing of this kind presents some delicate problems. Holler bearings and Michell segmented bearings have given good results. The electrical parts of a hydro-power

The electrical parts of a hydro-power station do not differ essentially in design from those of a thermal power station Outdoor switchgeur and transformers are favoured wherever possible. See D. B. Rushmore and E. A. Lof, Hydro-electric Power Stations, 1920; A. H. Gibson, Hydro-clastic Empirering, 1921; G. Gerard, Hydro-electric Engineering, 1919; and Reports of the Conference Internation ale des Grands Reseaux Electriques, (C.1 G.R.E.) held annually in Parts.

Hydrofluoric Acid, or Hydrogen Fluoride (11b), coloudess liquid, boiling at 19 % and giving off irritating and dangerous funcs. It is obtained in aqueous solution by heating calcium fluoride (fluorspar) with concentrated sulphuric acid in a leaden retort, and passing the gas evolved into water

$$(CaF_s + H_sSO_s - CaSO_s + 2HF)$$

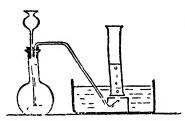

Fo obtain the pure acid, hydrogen potassium thoride, HF, KF, is distilled in a platinum retort, the H. A. being collected in a cooled receiver of the same material. It. A is an extremely active acid, and is especially valuable on account of its solvent action on silice and slicates, being used to otch glass. For this purpose the attele is covered with wax, and the marks or other designs required are out upon the wax with a steel rool: on exposing to the acid, the parts laid bare are etched, and the rist of the article is untouched. The fluorides, or salts of II. A., with the exception of those of the alkah metals, are insoluble in water. Of these calcium fluoride is the most important.

Hydrofluosilicio Acid (II_sSiF_i) obtained torc'her with silicie acid by passing silicon fluoride (prepared by the action of concentrated sulphure acid on a mixture of fluorspar and fine sand) into water. H. A is only known in aqueous solution, which is colourless. If heliaves as a dibasic acid, and forms sparingly soluble potassium and burium salts. It is used in hardening

around the circumference. This chamber is sometimes (in low-head installations) in a sometimes (in the concrete of the foundation. For higher heads (>100 ft.) a steel casing gaseous element, discovered by Cavendish by a cylinder gate inserted between the guide vanes and the runner and silded it is the lightest clean it known, and was axially by the governor. This method if ormerly taken as the standard for

measuring gas density and atomic weights.] measuring gas density and atomic weights.

H. is most conveniently prepared on a small scale by the action of sodium on water, or by the action of zinc on sulphuric acid, Zn + H₁SO₄ = ZnSO₄ + H₃. On the large scale, scrap-iron is used in place of zinc, or the gas is prepared by passing steam over red-hot iron, or by electrolysing water. More often nowadays it is obtained by removing the carbon. days it is obtained by removing the carbon monoraide from water-gas (q.v.). It is also obtained as a by-product in the manuf, of many other chems., e.q. sodium and caustic soda. When pure, H is a colourless, odonriess gas, which condenses at a low temp. and under great pressure to a liquid boiling at -253° C. and freezing at -259° C. The liquid, which was first produced by Dewar in 1898, has a density only 'th that of water, whilst the gas has a density 'th that of air H.

THE PREPARATION OF HYDROGEN Obtained by pouring hydrochloric acid on granulated zinc

is very insoluble in water, and is incapable of supporting respiration, although not actually poisonous. It burns in air with a non-luminous flame, water being formed: if mixed with air or oxygen and ignited a violent explosion is produced. H. is a powerful reducing agent combining with the oxygen, chlorine, etc., of bodies with which it is heated. It unites with many elements to form by drives of very varying properties, such as water, hydrochloric sulphide, and ammonia. acid. H. metal palladium has the power of absorbing about 900 times its vol. of H., use being made of this property in purifying and storing small quantities of gas. H. is present in all acids, in fact, the acids may be regulded as the salts of H. It is also present in hydrocarbons, oils, fats, starth, and in almost all natural and artificial compounds of organic chem Commercialty. H. is used as a reducing agent, as a means of producing buch temps. in the oxy-II. dame, and for filling air ships and balleons. Its prin. use is in the synthetic manuf, of animonia (q, e,) from nitrogen and H H, is also used for hardening only (e, q), in the manuf, of artificial lard and margarine) and in the presentation paration of quick-drying varnishes. Although H. was originally taken as the standard for atomic weights, it has been customary of late to take exygen = 16

compounds of the clements with oxygen are more numerous and more readily analysed than those with H. On this arrangement H = 1.008 instead of unity.

Heary H. See DEUTERIUM.

Hydrogenation of Coal, see COAL, HYDRO-GENATION OF.

Hydrogenation. Direct combination of gaseous hydrogen with a substance—usually restricted to those examples where direct addition of hydrogen to an unsaturated organic substance takes place.

Sabatler and Senderens (1897) invented the method whereby the body to be hydro-genated reacts with gaseous hydrogen in the presence of catalysts such as nickel, cohalt, iron platinum, and copper, at a moderate temp. Thus when a mixture of ethylene and hydrogen is passed through a tube containing nickel at 130-150° C, chane is readily formed: C.H. + H. = C.H. At higher temps, the reverse process of dehydrogenation is liable to occur. other examples are: the conversion of acetylene into ethane aldebydes and ketones into alcohols; nitriles into anines; whilst nickel, which is the most active of the catalysts, can even cause direct addition of hydrogen to benzene derivatives.

Ipatiev (1901) used similar metals and their oxides as catalysts, but worked at high pressures (up to 130 atmospheres). Colloidal metal catalysts have also been employed at almost normal temps, and

pressures.

Industrially, unsaturated oils (e.g. whale, huscod, and cotton seed oils) are hardened by hydrogenation, using nickel cataly-to give products suitable for edible purposes, and for the manufacture of some.

Hydrogen Blowpipe, Atomic. hydrogen is blown through the electric are the atoms composing its molecules are forced apart from one another. If this atomic hydrogen is then burnt immediately in a blowpipe, tremendous heat is evolved and very high temps, are produced. The atomic hydrogen blowpipe is largely used in metallurgy, ongineering,

Hydrogen Bromide, see Hydrobnomic

Hydrogen Chloride, see HYDROCHLORIC Hydrogen Fluoride, see Hydrofic Toric

ACID.

Hydrogen Iodide, see Hydronic Acid. Hydrogen Ion (Hydrion). The hydrogen atom is an electrically neutral system composed of a central nucleus of one solitary proton (the unit of positive electricity), revolving found which is a single electron (the unit of negative electricity). If such a hydrogen atom loses the attendant electron, it is left with unit positive charge, and is, indeed, a proton. In this condition it is called the (positive) hydrogen ion, (In some cir-cumstances a hydrogen atom can take up an electron to form a negative H. I). These solitary protons can be formed from hydrogen by electric discharge (see I) is-OHARGE TUBES), or by bombarding gasas the basis, owing to the fact that the cous nitrogen with or particles, when some protons are shot away from the nitrogen nucleus.

All acids possess the property of giving H. I. in solution. For example, in an aqueous solution of hydrogen chloride (II(1)), lons of hydrogen and of chlorine are present. For every hydrogen atom which has lost an electron, an atom of chlorine has gained one. If an electric current is passed between carbon poleimmersed in such a solution, the hydrogen ions are directed towards the eathode, and, on reaching it, their charge is neutralised, when ordinary hydrogen results. Similarly ordinary chlorine appears at the anode. The sour taste and other specific properties of acids are due to the presence of colourless hydrogen ions. 'Strong' acids give a larger proportion of these ions at moderate dilutions than 'weak' acids do. When a metal liberates hydrogen from an acid, it gives up electrons to the H. I., thereby be-coming itself positively charged. The H. I. is also capable of relatively

rapid movement, and it can also function as a catalyst in many operations such as the inversion of cancengar, and the hydrolysis of esters, amidos, etc. Thus the properties of H and entirely different

The H I in water is hydrated and has the formula H.O.

Hydrogen ion concentration (H.) is expressed in terms of equivalents of II. I. present in grammes per litre. Thus, pure water contains 0 0000001 gm of H I per litre. Therefore (H) = 10⁻⁷. It can be determined usually by (I) measurement of electrical conductivity, (2) determina-tions of the E.M.F. between the solution tested and an unionised hydrogen electrode, (3) the use of special indicators, (4) osmotic pressure methods, pit ralu is given by

Thus for pure water

$$p_{\rm H} = -\log_{10} (10^{-7}) = 7.$$

Suitable conditions for privalues are essential for many biological, chemical and other operations.

(See ACIDS; INDICATORS; NEUTRALI-SATION; IONISALION).

Hydrogen Peroxide, or Dioxide (H₂O₂), is, when pure, a colourless, slightly viseld liquid having a sp. gr. of 1-15, freezing on cooling to a solid, having a melting point of -2°C. It is readily soluble in alcohol or water. The aqueous solution is obtained by the action of dilute sulphuric acid on hydrated barium peroxide, barium sulphate being precipitated. BaO₁ + H₂SO₄ = BaSO₄ + H₂O₅. Sodium percoxide, Na₄O₅, is often used in place of BaO₄. The aqueous solution obtained may be concentrated by evaporation, followed by distillation under reduced pressure. The pure substance has a bitter tasta a faut edgus resembling ratios and taste, a faint odour resembling nitric acid. and is unstable, decomposing explosively under various conditions into oxygen and water. The aqueous solution is more stable, especially in the presence of a "Challenger" (50 vols.). mineral sold, and may be kept for a considerable time. It is usually sold in ments of Hydrology, 1928.

vols.' '20 vols.,' for instance, indicating that 1 vol. of the solution will liberate 20 vols. of oxygen on decomposition. II. P. is a powerful oxidising agent, liberating iodine from potassium iodide, oxidising sulphides and sulphites to sulphates, and bleaching by oxidation. It also has the property of setting free the oxygen, together with its own available oxygen, from certain metallic oxides and highly oxidised salts, thus apparently acting as a reducing agent. H. P. is largely used in the arts for bleaching ivory, feathers hair etc.; as a disinfectant, and also for restoring old oil paintings, by oxidising the black lead sulphide (formed by the action of sulphur compounds in the air on the lead contained in the paints) to the white sulphate. Sodium carbonate and barium percarbonate, prepared electro-lytically, have recently been used with success for the manuf, of H. P. H. P. has been used as a fuel in rockets and submarmes

Hydrogen Sulphate, see SULPHURIC ACID Hydrographic Surveying, see SURVEYING

AND LEVILLING.

Hydrography, scientific description of the waters of the globe. The subject will include: (a) Marine surveying, or the measurement and mapping of the water area; this will result in the preparation of "aps and charts showing the position of stas, lakes, and rivs. Navigation de-mands from the nautical survey or some knowledge of the contour of the ocean bed and in accurate outlining of all shallows, deeps, and reefs. The Hydrographic bept of the Bilt. Admiralty, which was estab in 1795, undertakes the making of such charts under the charge of the livelographer to the Admiralty. The advent of last, deep-draught vessels in recent times has made necessary the recharting of the oceans of the world, and a new survey with new instruments was commenced by the Hydrographic Dept. m 1948 (see Charr). (b), or liverology, Physical properties of the war r masses. The actual composition of the waters on the secretained, and their vided and saving salinities introduce the wide question of oceanic enculation, to which a related the identification of thermal are is in both horizontal and vertical dis-tributions. The tidal circulation has important bearings on questions of navigation, and the hydrographer is concerned in the preparation of tables showing the 'estabs, of ports.' An important sconome study in H. has for its objective the analysis of the distribution and movements of those myricle of micro-organisms, plunkton and rekton, which play so great a part in the life hist, of the various food fishes. Not only does the subject food lisines. Not only does the sult-water cover the investigation of the sult-water lakes also demand special treatment. To realise demand special treatment. To realise some of the classes of investigation comsome of the 'asses of investigation comprised under a seading, reference should be made to the Official Reports of the Scientific Results of the Voyage of H.M.S. 'Challenger' (50 vols.). See also Ocean-Ocean-Courages. See A. F. Moyer, The Flement of Visides of the Post of the Post

Hydrokinetics, or Hydrodynamics, science dealing with fluids in motion. It forms a theoretical introduction to the practical subject of hydraulics. Fluids at rest are dealt with in hydrostatics (q.v.). A fluid may be defined as that which yields to the slightest tangential stress, if it be continued long enough. Thus, easily yields to the signifiest tangential stress, it to be continued long enough. Thus, though a piece of pitch may be easily smashed into small fragments by a blow of a hammer, in course of time, if left to itself, it will spread itself out over a surface and flow like a liquid by virtue of its weight alone. Hence pitch is a fluid, but ince its change of form takes place gradually, it is termed a viscous fluid. All fluids are viscous to some degree, and as the molecules move over one another, friction forces exist which tend to generate heat. But in the case of water, and, in fact, in most liquids, especially alcohol and ether, the viscosity is so small that actual results coincide very closely with the action of a perfect fluid—the ideal fluid, which is inviscid, i.e. which cannot sustain any tangential stress. So the theory of H. doals almost entirely with perfect fluids. Fluid motion may be steedy or unsteady. By steady motion is meant that at any point fixed in space the motion of successive particles of fluid is always the same in magnitude and direction, though it may vary from point to point. If the motion is the same at all points of the fluid, so that the fluid moves like a solid body, it is termed uniform. Moving masses of fluid, bounded partly or completely by solid boundaries, form a stream. A stream boundaries, form a stream. A stream bounded by the same fluid moving differently is termed a current, and when bounded by different fluid is termed a jet. An eddy or a rorter is formed by fluid with a circular or spiral motion. It is proved that a vortex must be endless or have its ends on the free surface of the liquid. The ends on the free surface of the liquid. The actual path of any particle of fluid is called a stream line, and if the stream lines are drawn through all points of a closed curve a tube of flow is formed. Thus there can be no flow across the lateral boundaries of a tube of flow. A line of flow is such that at any point of its length the tangent coincides with the direction of molion of the point. Stream lines and line of flow. the point. Stream lines and line of flow are coincident when the notion is steady.

The usual methods for forming the

general equations of fluid motion are by means of differential and integral calculus and will be given later, but certain particular cases may be dealt with in a more elementary way. Thus the 'cquation of continuity' is obtained from the principle that the amount of incompressible fluid flowing into any completely bounded space, upposed continuously filled with iliquid, coust be equal to the amount that flows out. If a, and a, are the areas of any two cross sections of a stream, and y, z, the components of the velocity of the finid normal to the cross sections, then the amounts of fluid flowing across the sections in a unit of time are a,v, and a,v₄. Hence a,v₁ = a,v₂, and those $a_1 y_1$. Hence $a_1 y_1 = a_2 y_1$, and these velocities are inversely proportional to the areas. Again, consider a liquid moving in a horizontal straight line uniformly—

that is, like a solid body—with no relative motion of its parts, and suppose a small portion of the liquid in the shape of a circular cylinder with its axis along the line of motion to become solidified. Let a be the area of its cross section, I its length, p, and p, the fluid pressures at its ends, m the mass of a unit vol. of the fluid, and I its acceleration. Then mal is the mass of the cyclinder and $(p_1 - p_3)a$ is the component of the resultant force on it in the direction of motion, since the ends are considered so small that the pressure over considered so small that the pressure over them may be taken as constant. Hence, by Newton's second law, $(p_1 - p_2)_a \approx mal/$, and thus so long as there is an acceleration the pressure varies along a horizontal straight line. Now if p_1 and p_2 are the pressures due to depths h_1 and h_2 are the pressures due to depths h_1 and p_1 and the free surface, it follows that $p_1 - p_2 = mg(h_1 - h_2)$, since the principle estable in hydrostatics for pressure at given depths holds in this case.

$$\therefore h_1 - h_2 = \frac{p_1 - p_2}{mq} = \frac{mlf}{mg}.$$

RIG. 1

Therefore the free surface of the liquid slopes downwards in the direction of motion at an angle to the horizon (Fig. 1)

$$\tan^{-1}\frac{h_1}{l} - \frac{h_2}{l} = \tan^{-1}\frac{f}{g}$$

ffence the free surface of a liquid in a vessel carried along at an acceleration makes an angle with the horizontal, and this angle increases if the acceleration increases. If there is no acceleration, the surface is horizontal.

Again, if a vessel, in the form of a right circular cylinder with vertical axis, and the hand within it rotate about the axis with a constant angular velocity ω , then any particle of liquid distant x from the axis will have an acceleration war towards the axis. This increases as x increases. The pressure is therefore least on the axis of rotation and gradually increases further from the axis. Hence the free surface will be lowest in the middle and will gradually rise towards the side of the vessel (Fig. 2). It is found that a section of the surface by a plane through the axis of rotation gives a parabola, and the whole surface is a parabolal of revolution. When the liquid only, and not the vessel, rotates, the outer layer of the liquid in contact with the vessel is at rest. The next layer rotates slowly, and for a

time each successive layer has a bigger angular velocity. As in the previous case, the velocity in the middle is zero, and gradually increases outwards, and honce

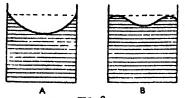

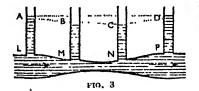

FIG. 2 A, liquid and vessel rotating B, liquid only rotating

the layer of greatest velocity is somewhere intermediate between the axis and the side of the vessel. The free surface then takes the form shown in the figure. The takes the form shown in the figure. accumulation of mud near the inner bank of a riv. at a bend may be accounted for by continuing the argument.

The same general principle of the pres-

sure gradient, as it is called, has been used to correct the common mistake that as a fluid passes through a pipe of varying cross section, it exercises greater pressure on the sides where the pipe is narrower. In fact, the opposite is true. Let AL.

BM, CN, DP (Fig. 3) be small vertical pipes let into such a pipe. Then the height to which the liquid rises in each of these gives the pressure. It is found that at L and P where the cross section is largest, the heights AL and DP are greatest. Account has to be taken in this experiment of the action of friction, which tends to lessen the height of the columns, and has a bigger effect the further the water travels along the pipe. This prin-ciple has a practical use in the Venturi water meter.

The principle of the conservation of energy gives a simple proof of an important equation of motion. Let a_1 , p_1 , r_1 and a_2 , p_3 , r_2 be the area of the cross section, the pressure, and the velocity respectively at two ends of a thin tube of flow, a being so small that p and v may be considered constant for the area. Since there is no flow across the boundaries, the there is no now across the boundaries, the countion of continuity gives $a_1v_2 = a_1v_3$. By the conservation of energy, the difference between the work done by the fluid crossing the two sections is equal to the perfect fluid; if p denotes the pressure at total difference between the energy in the the point (x, y, z) in the fluid and X, Y, Z

E.E.

two cases. In a unit of time the difference between the work done is $p_{1a_1v_1} - p_{1a_2v_2}$, the difference between the potenthat energy in the two cases is $m(\alpha_1 p_1 V_3 - \alpha_1 p_1 V_1)$, where m is the mass of a unit vol. and V_1 , V_2 the potential energy at the two sections, and the difference of kinetic energy is

 $\begin{array}{lll} \vdots ma_{2}v_{2} \times v_{2}^{2} - \frac{1}{2}ma_{1}v_{1} \times v_{1}^{2} \\ \vdots p_{1}a_{1}v_{1} - p_{2}a_{2}v_{2} &= m(a_{2}p_{2}\nabla_{1} - a_{1}p_{1}\nabla_{1}) \\ &+ \frac{1}{2}ma_{2}v_{2}^{2} - \frac{1}{2}ma_{1}v_{1}^{2} \\ \vdots p_{1} + m\nabla_{1} + \frac{1}{2}mv_{1}^{2} &= p_{2} + m\nabla_{2} + \frac{1}{2}mv_{2}^{2} \end{array}$ and this is the same for any two points

and this is the same for any two points of the tine of flow.

The Equation of Continuity. This is the fundamental equation of the hydrodynamics of a perfect fluid. It may be derived as follows. Suppose P is a point (r, y, z) (referred to rectangular co-ordinate axcs) in the fluid and let (u, y, w) be the companients of the velocity parallel to the components of the velocity, parallel to the co-ordinate axes, of the fluid at P at times. Then if the motion is continuous, i.e. if u_1 , v_2 , u_3 are finite and continuous and u_4 u_5 u_6 u_7 u_8 $u_$ we consider any closed surface drawn in we consider any closed surface drawn in the fluid, the increase in the mass of the fluid within the surface in any time of must be equal to the excess of the mass of the fluid that flows into the surface over the mass that flows out of tt. Let p denote the density of the fluid at P(x, y, z) and consider a small parallelopiped $\delta x \delta y$ is with P as centre. Then the mass of fluid that flows in across the face parallel to the plane yz nearest the origin in time of is

$$\left[\rho u - \frac{1}{\delta x} \frac{\delta \rho u}{\delta x} \cdot \delta x\right] = 0$$

and the mass flowing out across the opposite face in the same time is $\left[\mu u + i \frac{\delta_{\mu} u}{\delta_{\mathcal{K}}} . \delta x \right] \delta y \delta z \delta t. \quad \text{Hence the in-}$ crease in the mass of the fluid inside the parallelopiped due to this pair of faces iq = $\frac{\alpha_{PH}}{\delta x}$. $\delta x \delta y \delta z \delta t$ in time δt . Similarly we can find the increase in the nines of the fluid due to the other pairs of faces and we get for the total gain in mass in time δt , $= \begin{bmatrix} \delta \rho u + \delta \rho v + \delta \rho u \\ \delta x + \delta y \end{bmatrix} \delta r \delta y \delta r' t$. But since the mass inside the parallelopiped at time I was parayos, the gain in mass in time of in $\frac{\delta_{ij}}{\delta t}$. S. ϵ_{ij} δ_{ij} δ_{ij}

Hence equating these expressions we get

This is called the Equation of Continuity. For a homogeneous and incompressible liquid p is constant and the above coustion reduces to

$$\frac{\delta u}{\delta c} + \frac{\delta r}{\delta y} \quad \frac{vv}{\partial z} = 0.$$

This is approximately true for liquids, but the more general equation must be

test.

 $\frac{\delta u}{\delta t} + u \frac{\delta u}{\delta x} + r \frac{\delta u}{\delta y} + w \frac{\delta u}{\delta z} = X - \frac{1}{\rho} \frac{\delta p}{\delta x}$

and two similar equations.

The study of H. is concerned with the integration of these equations, subject to the equation of continuity, applied to the special circumstances of each problem under review. The practical importance of H. has increased with the study of aeronautics.

aeronautics.

ics, 1940.

Hydrolysis (literally splitting by water). term applied to those chemical reactions in which decomposition is brought about by the action of water, and must not be confused with hydration, in which water is taken up without causing disruption of the molecule, e.g. as in the conversion of quicklime into slaked lime. Examples of H. are numerous, e.g. the splitting up of the salts of weak acids by solution in water, the conversion of esters into acid and alcohol, the 'inversion' of cane sugar, and the formation of ammonium saits from nitrites. In some cases H. takes place by mere addition of water, but more usually heat is required, and in addition a small quantity of acid or alkali to hasten the reaction.

Hydromechanics, term generally applied to the science dealing with the mechanics of fluids, it includes hydrostatics (q.v.) and hydrodynamics or hydrostatics (q.v.) and hydrodynamics or hydromechanics or hydrostatics (q.v.) and hydrodynamics (q.

kinetics (q.v.).

Hydrometer, instrument for finding the densities of liquids. By density is meant the weight of a unit vol., usually

the weight in grammes per cub. centimetre. The relative density of any substance is the ratio of its density to that of water. The most elementary form of H. consists in a thin glass tube AB ending in two spheres C and D. D is loaded so that the instrument floats in a vortical position. By Archimedes' principle, if any body floats in a liquid, its weight is equal to the weight of the liquid displaced. Hence the H. will sink deeper in lighter liquids, and the density of a liquid is inversely pro-portional to the vol. immersed. Since the tube AB is thin, only a very, small additional vol. is B C immersed where the H. sinks lower, and hence the instru-ment is open to the objection that only liquids whose densities are nearly equal can be compared by means of any one H. Thus a H. constructed for HYDRO-METER

heavy liquids will sink entirely in light

the components of external force per unit mass at the same point, it may be shown in water, and to Y in any given liquid; that the equations of motion are then, if V and V' respectively be the vols. immersed in the two cases, the relative density of the given liquid is vi.

> In practice a graduated scale is usually fixed to the stem AB, and the reading opposite the surface of any liquid in which the H. is immersed is the density of the A common form of II. in general liquid. use is the lactometer, for finding the density of milk and hence testing its quality.
>
> Sike's II. is used for ascertaining the strength of spirits. It is a goldplated bruss II. somewhat similar in shape to the usual pattern of II. It is used with a sense of gold-plated brass weights that can be shated on to the bras of the story. can be slotted on to the base of the stem. The 'proof' of spirit can be determined from standard tables when the reading of

the H. has been taken in the spirit under

There are many other forms of H., such as Twaddle's (used for finding the specific gravity of mixtures of sulphuric acid and water), Baume's, and Nicholson's H. The latter is well known as a constant displacement II., and it can be used to compare the densities of different liquids and to find the sp. gr. of solids, but it is of little practical importance outside the school laboratory. Generally speaking the principle of all IIs, is the same. In practice it is found to be very difficult to get an extremely accurate result with a II., because of the surface tension and capillarity of liquids, which gives the surface of the liquid a curved form where it touches the stem. The possibility of error is diminished, however, by making the stem as thin as possible, and by keeping the instrument clean. In finding the density of a liquid to some degree of accuracy, attention must be paid to its temp., as a rise in temp, lowers the density. Hs. are used extensively in industry because they are sufficiently accurate for general purposes and they are convenient and easy to use. They can be tested against standard instruments for a small sum at the National Physical Luboratory at Teddington in England. See also Hydrostatics.

Hydrometridee, name given to a family of hemiptera-heteropterous insects, often called pond-skaters or water-striders. They live on the surface of water and feed on insects and aquatic débris. Hydrometra, Velia, and Mesorelia are common Brit. genera.

Hydromys, generic name of certain species of rodents belonging to the sub-order Simplicidentate and the family order completeentate and the family Murido. H. chrysogoster, the best-known species, is limited to Australia, and is aquatic in habit: It is a ft. or so in length, with a somewhat long tail and yellowish fur; the feet are webbed, and there are only two molars in each half of either jaw. Xeromys is an allied genus confined to Queen land.

Hydropathy, name of a curative system in which the external and internal use of water is the chief remedial measure. General H., introduced by Asolepiades, made rapid progress between 334 s.c. and A.D. 180, when nearly 2000 public baths, including the famous baths of Caracalla and Diocletian, were built. Water was and Diocletian, were built. Water was conveyed by aqueducts to the baths, and in many, like those of Pompeli, there were elaborate hypocausta. The Roms, had baths built also in their colonies, and so H spread throughout Europe. The print natural springs first used extensively in hydropathic treatment were the thermo-pylae of Greece, the thermae at Baiac, and those in the Rom, colonies. Of these, Aix-le-Bains, Baden-Baden, Aachen, Wies-baden, and Bath are still famous hydro-pathic centres. The value of water applications of various kinds is recognised by all classes of physicians, and the name hydrotherapy (q.v.) or hydrotherapeutics is applied to measures involving the use of water. H. is by common consent held to mean a definite theory of cure in which the value of water transcends all else, and the administration of other medicinal agents is looked upon as generally deleterious. The fame of II, originated with the work of Vincent Priessnitz (1801–51), a farmer of Grafenberg in Silesia. Priessnitz had administered cold-water bandages to sick and injured authors with marvellous success, and extending his practice to human beings, including himself, wrought such wonderful cures that the water system became the vogue, and estabs for the direction of the cure were instituted in England, Germany, France, and America. The new practitioners and the orthodox school of physicians denounced each other as quacks for many years; but in course of time ordinary medical practice has absorbed many ideas of the water curers, while the hydropathic estabs of to-day are less extreme in their regu lations than those of former generations.

Hydropericardium, see under Drorss. Hydrophildm, name of a family of polymorphous colcoptera (beetles), which are widely distributed and chiefly aquatic Hydrophilus, the typical genus, contains the species H. piccus, one of the largest of Brit. beetles.

Hydrophis, see Habers. Hydrophobia, see Rabers. Hydrophone, instrument for listening to sound transmitted through water. There are various kinds, one of which receives electric transmissions from the ship on which it is placed after striking the sea bottom. The principle was used during the First World War to locate Ger. U-boats, but was superseded by Asdic (q.v.). See also under Ecno.

Hydrophyllaces, family of dicotyle-donous plants, most of which occur in N. America. They are allied to the Bornginaceae. All are helps or small shrubs and are generally hairy in appearance. The flowers are regular and hermaphrodite, and are generally in parts of tive; the sepals and petals are five in number and united, the stamens are fine and are epipetalous (s.e. attached to the petals); the ovary is superior, and consists of two united carpels, usually with numerous ovules in each localus; the fruit is often a loculicidal capsule. The chief genera

are Hydrophyllum and Nemophila. The latter genus is common in gardens in Great Britain.

Hydroplane. The earliest type of H. was invented by Glenn Curtiss, and was in the form of an acroplane with a pon-toon fitted to the under portion to enable it to rest upon water. Hs. were greatly improved through the Schneider Trophy (q.m.) contest, in which they were largely employed with success by Italy, U.S.A., and Great Britain (see APRON AUTICS). A development of the H. was the coastal motor boat (C.M.B.), which did good work for the Brit. Navy during the First World Success required a speed of at war. Success required a speed of at least 16-18 m.p.h. and the C.M.Bs. were capable of 30 knots per hour. They were upwards of 40 ft. in length, and carried one to pedo, which was discharged att and toll first on the assumption that the swift craft would be able to turn clear of the torpedo after it had been discharged. They were smooth-water craft, and could travel a little faster then Ger. destroyers. Their value lay in a combination of high speed with inconspicuousness. They were most effective at night, but in day-light or moonlight the Ger, destroyers could hunt them down. Those attached to the Dover Patrol were employed to lay mines off Zeebrugge.

Hydroponies, Amer. term coined to describe the growing of plants by water-culture or soilless methods, by Dr. W. F. Gericke, a pioneer in this field. Broadly, the method consists of raising plants tountoes, potatoes, roots, bulbs, carna-tions, herbaccous flowers, etc — in a porous most seed-bed of mert material (peat, leaf mould, sawdust, straw, wood shaying, spun glass), suspended on a netting of wire over a brief air space and tank containing a water solution of nutrient salts. chored in the seedbed, the plant stems grow upward normally, and the roots downward to feed in the solution. Naturent solutions are made up of major plint foods (nitrogen, potasshim, phosphorus, calcium, magnesium) and others needed in smaller amounts (sulphur, boron, copper, iron, manganese, zinc) to give an effective nutritive balance for the plants grown. Success depends targely upon adequate sunshine, aeration of roots and control and circulation of the solution. II. succeed best in warm countries (California, for example), and in greenhouses Capital costs are high, offset by heavier yields per given area, which are likely to be most profitable when consisting of luxury crops, or when produced in barren tropical areas on air routes. In Britain. the climate apparently does not favour true hydroponic methods, and more use and attention is being devoted to sand or gravel-culture methods in which plants are grown in beds of sand, gravel, cinders, part-peat, or similar inert materials watered by a nutrient solution, collected by sub-irrigation and pumped for re-dis-tribution through the bed. As yet, owing tribution through the bed. As yet, owing to high capital costs and relatively poor results under temperate conditions, H. is unlikely to compete seriously or to supplant soil culture. See Dr. W. F.

Hydrostatics (Gk. 18mp water) science
dealing with the mechanical problems of fluids in equilibrium Fluids are either liquids or gases. The latter are easily compressible, whilst the former are only very slightly so. The perfect fluid to which gases and ordinary liquids such as The latter are easily water approximate is defined as an aggregation of molecules which yield at once to the slightest effort to scparate them from each other From this definition from each other From this ucministration of a property follows the following fundamental property follows the following fundamental property follows the pressure of a property for the pressure of the pressure o perfect fluid at rest is always normal to any surface with which it is in contact. Actually this property extends to all fluids what ever their viscosity, for the molecules of any fluid cannot indefinitely resist the slightest effort to separate them from cach

other
The pressure at a point in a fluid is defined as the force per unit area on a very small area surrounding that point can be demonstrated theoretically can be demonstrated therefore (see bibliography) that in a find at rest the pressure is the same in all directions. Two further important relations are (1) the pressure in a fluid at rest is the same at all points in the same horizontal plane, and (2) the pressure at a point due to the fluid in a fluid at rest is directly propor tional to the depth of the point below the surface of the fluid. The first proposition is estab by considering the equilibrium of a thin horizontal cylinder of the liquid. The pressure over the vertical ends of the cylinder may be regarded as constant over each since they are small. By resolving the external forces acting on the cylinder in a horizontal direction it is seen that the two forces on its ends are equal and there

fore the pressures also must be equal Hence it follows that the free surface of any liquid at rest is a horizontal plane. In order to establish the second proposition suppose P (Fig. 1) he any point in a liquid at rest at a depth h below the surface. surface (onsider again a thin circular runace consider gam a time through the cylinder extending verbially from P to the surface M * The forces on the curved surface are all horizontal Hence the upward force at P supports the weight of the cylinder. If the bethe area of the small horizontal end at P and w the weight of a unit vol of the liquid, then the upward force is was Hence the pressure at a depth h in a liquid at rest is equal to wh.

liquid An elementary experiment for testing the pressure at various depths of a liquid may be made as follows. Take a liquid metal disc D (Fig 2) supported by a string S and a hollow glass cylinder open at both ends 1 and B Pass the string through ends 1 and B Pass the string through the cylinder and pull it tight so as to hold the disc firmly against the lower end B

Lower this into a vessel of water Lower this into a vessel of water — It will be found that when the cull H is sufficiently low, the string may be let go, and the upward pressure of the water alone will be sufficient to hold the disc in position— By using discs of various weights and measuring the depth at which each is just held in position by the water the law may be verified. In actual practice, the restriction may be up to the restriction which can be the restriction with the control of the restriction with the control of the restriction. the receiver supplying water to a th is placed on a high level in order to obtain an adequate pressure on the water main Similarly canal banks and dock gates are made stronger towards the bottom to stand greater pressures

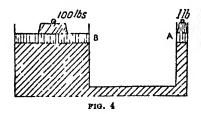

Secing that the pressure in a liquid due to the liquid varies as the depth below the surface, the total pressure on any plane surface is best found by methods of integral calculus But certain cases are The total pressure on a horizontal nimple plane area has been mentioned above thus it a number of vessels of varying stares have bottoms of the same area and are filled with water to the same depth the total pressures on the bottoms AB (Fig 3) are all the same no matter how

much water is put into each vessel, for each is the weight of a column of water force is wat Hence the pressure at a depth in a liquid at rest is equal to wh. In a similar way the resultant vertical where w is the weight of unit vol of the pressure on a portion of any surface is the 357

weight of the liquid enclosed by vertical lines drawn through all points bounding the portion of surface up to the level of the free surface of the liquid. To determine in general the total normal pressure on one side of a plane figure immersed in a liquid, by means of integral calculus, the figure is divided into a large number of very thin horizontal strips; the pressure at all points of the same strip may be considered constant. Let θ be the angle the plane makes with the vertical, x the vertical distance of any strip whose corresponding length is y. Then the total

pressure is $\int_{r_1}^{x_2} w cy$ sec. θdw , where r_1 and r, are the depths of the top and bottom strips respectively. The centre of pressure of any plane area immersed is the point of action of the resultant pressure, and this also is best found by means of integral calculus. In the case of a rectangular area with one side in the surface of the liquid, the centre of pressure is two thirds of the way down. If the pressure on the surface of a liquid is P, then it follows from the second proposition mentioned above that the pressure at a depth h in a liquid at rest is P + wh; in other words a liquid transmit are applied to its surface. This principle is employed in the Bramah press (see Hyprauric Press) lig 1 explains this. A and B are two

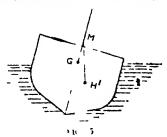

pistons, one of yery much larger area than pastons, one of vivi much larger are than the other, working in cylinders which are connected as shown. The vessel is filled with water. Suppose V has an area of cross section of 1 sq. in., and B an area of cross section of 100 sq. in. Then a pressure of 1 lb weight per sq. in. on V will result in an increase of pressure of 1 lb, weight per sq in on B. Hence the torce on B is increased by 100 lb, weight when a force of 1 lb weight is applied to A as shown.

Atmospheric Pressure. -The earth surrounded by a limited atmosphere which gets less dense at higher altitudes. It may be proved that air has weight by weighing a flusk from which the air has heen exhausted and weighing it again when full of air. So, as in the case of liquids. the weight of a column of air is supported

noticed. A common experiment is performed by means of the Magdeburg hemis-pheres, which consist of two metal hemispheres made to fit exactly together. They may easily be pulled apart by means of handles provided. If, however, the air is exhausted from the interior when they are litted together, a very large force is necessary to overcome the atmospheric pressure and to separate them. The atmospheric prossure is measured by means of the barometer (q.v.), in which the column of arr is balanced by a column of mercury, about 30 in. high. When of mercury, about 30 in. high. When much water vapour is present in the air the lighter, and sometimes a column of incicuity 25 5 in. high is sufficient to balance it. In a similar way if the barometer is carried up a mt, and thus the column of air diminished in height, the necture falls. A balanness constructed mercury falls. A barometer constructed with water would be about 33 ft. high. The suction pump depends on the same principle as the water barometer, viz. that the pressure of the air on the surface of the water outside the pipe drives the water up the pipe where the air pressure value of the pipe where the air pressure is only equivalent to a column of 33 ft. of water, water cannot be raised by means of a suction pump through a height greater than 33 ft.

11 himseles' Principle states that if a

body be immersed in a liquid its apparent loss of weight is equal to the weight of the liquid displaced. Further, a floating body displaces a vol of liquid whose weight is equal to its own. Thus a piece of cork to ally immersed in water will rise to the surface because it displaces more than its own weight of water. In a similar way a balloon rises because its total weight is tess than that of the air displaced. An achery whose specific grivity (q.v.) is about ten-elevenths will float in water with about ten-elevenths of its vol. beneath the surface (for density and sp. gr., see Hydrometer). A most important practical application of the question of floating bodies occurs in shiply iding. A

ship will not be sate unless its shaps and the weight of a column or air is supported by the surface on which it rests, and this weight at the surface of the earth is the arrangement of its earge are such that weight at the surface of the earth is the arrangement of its earge are such that twill right itself after a considerable roll known as atmospheric pressure. It to either side. The first thing then is to ensure that its vertical position is one of Since, in general, exsels contain air at atmospheric pressure inside as well as on the ship will restore it to the vertical outside, this pressure is apt to be un-

G be the centre of gravity of the ship and cargo, H that of the water displaced in a vertical position, and H that of the water displaced after the roll. Let the vertical through H meet the centre line of the ship through G at the point M. Then M is called the metacentre. The equilibrium is not stable unless M is above G. It may be shown that M is the centre of water applications, Among them may be mentioned cold packs and shock baths. The ordinary wet pack consists of a sheet wring out of cold water and wrapped curvature at H of the locus of H which is curvature at H of the locus of H which is known as the curve of buoyancy. PUMPS; SURFACE TENSION.

Hydrotherapy, or Hydrotherapeutics, system of cure which involves the internal or external administration of water. It is a branch of ordinary medical practice, and so to some extent is distinct from bydropathy, in which the use of water is claimed as the supreme general cure for disease. The internal administration of water is of course necessary for the main-tenance of life, but there are many reasons for supposing that fairly copious drinking of water is calculated to help the normal process of metabolism. By supplying the body with abundance of fluid, the carrying away of waste products is facili-tated, and the morbid effects of poisonous If the waste matter are thus avoided. practice of waterdrinking is indulged in consideration for times and without seasons, the results are apt to be unsatisfactory, as undue dilution of certain secretions is bound to impair their offcieucy. Good general rules for a person ciency. Good general rules for a person in ordinary health are the following: A glass of cold water on rising, one about an hour before each med, and one before retaring at night. In this way the dilution of the gastric juices is avoided, the water is supplied when the body needs fluid for preparation of gastric juices, and the action of the bowels is likely to be the action of the bowers is takely to be complete and easy. The action of natural water depends on the mineral substances they contain. Sulphates are present in the waters of Curishad and Cheltenham, and those of Harrogate and Bath contain sulphur. All these waters are purgative, and, by removing waste matter from the body, have a stimulating effect, and may be useful in the treatment of gout and rheumatism. Similarly, waters that are directic (i.e. promoting the flow of urine) may be stimulating, whereas others, such as the bromo-lodine waters of

others, such as the bond-bonne waters of Woodhall Spa, are sedative.

The external application of water hat two general purposes: that of skin cleansing, as in the ordinary soap and hotwater bath, and the application in a constant form of a constant required term. venient form of a certain required temp. To these may be added the more doubtful effects of substances in solution being absorbed by the skin, of possible radium

pressure. (See Balneology.) By far the greater number of water applications for curative purposes are simply temp, applications. Among them may be mentioned cold packs and poultiess, hot and vapour baths, and shock baths. The ordinary wet pack consists of a sheet wrung out of cold water and wrapped closely around the body; on this are superposed a number of dry blankets, the patient being kept practically immovable for an hour, when the packing is removed and the patient subjected to a bath at a for an nour, when the packing is removed and the patient subjected to a buth at a little above body-temp. The effect is soothing and provocative of increased cutaneous exerction. The cold pack aims at a lower temp, still; the body is sure that a lower temp, still; the body is sure that a lower temp, still; the body is sure that the packing the packing that the packing that the packing the packing that the packing that the packing that the packing that the packing the packing that the packing the packing that the packin rounded somewhat loosely with a wet sheet, and the other coverings are loosely arranged to allow evaporation as uni-formly as possible. The cold pack is used. in cases of hyperpyrexia, that is, in ex-treme fover. The Turkish bath is really a hot-air bath; it consists of a number of chambers heated to different temps,, so chambers neated to afterent temps, so that the patient is exposed to a temp gradually rising to 150° F, of higher, and is then allowed to regain the ordinary temp, of the air by gradations. The effect is to relieve internal congestion by bringing blood to the surface and to oxcite the peripheral exerctory organs to in-creased activity. A prolonged applica-tion of heat locally is sometimes resorted to in order to cause congestion, and thus lead to a greater activity of discass-fighting corpuseles (see BIER's CONGES-TON TREATMENT). Shock-baths, such as shower-baths, douches, wave-baths, etc., depend upon the sudden application of a particular temp, or the rapid alter-nation of two different temps. The effoct is stumulating. Brine baths have been extensively used with boneficial results for children suffering from general weakness, rhoumatio diseases, and other ailments. Baths acrated with carbon dioxide are prescribed for certain affeccarbon tions of the circulatory system. Saline baths have lately been much used in the treatment of extensive burns.

See F. Howard Humphris and R. S. Wolsh, Physiotherapy; Its Principles and Pratue, 1930; R. M. Queene, Hydro-therapy, 1936; M. B. Ray, Hydrotherapy and Clinatotherapy, 1936.

Hydrothorax (water on the chest), col-lection of serous fluid in one or both of the pleural cavities, associated with dis-ease of the heart, kalneys, and other organs. See also under Diopsy.

Hydroxide, in chem., the term applied to a compound containing one or more to a compound containing one or more hydroxyl (OH) groups, generally in combination with a metal. Thus NaOH is sodium H., Ca(OH), ealclum H., and Al(OH), aluminium H. The most important H. are caustic soda (NaOH), caustic potash or potassum H. (KOH) and slaked lime of calcium H. Ca(OH), In solution, metallic H. yield hydroxyl fore OH. ions, OH'.

Hydroxybenzene, see CARBOLIO ACID. Hydroxyl, the -OH group of atoms. emanations, and the stimulating effects of | It is present in many classes of compounds,

including hydroxides (q.r.), alcohols, sugars, phenols, and many acids. Hydroxylamine (NH,0H), unstable substance forming colouriess deliquescent needles (neiting point, 33°C). It may be prepared by the action of sodium nitrite on sodium bisulphite, followed by hydrolysis, or by the action of nascent hydrogen, from tin and hydrochloric acid. on ethyl nitrate or nitric oxide. It is also prepared electrolytically by the reduction of nitricacid. H., which is usually prepared in the form of its salts, is a powerful re-ducing agent, and forms compounds (oximes) by condensation with aldehydes and ketones.

Hydrozoa, name given to a class of Corlenterata belonging to the sub-phylum Cnidaria: it is coincident with Hydromedisa or Craspedota, with the addition of the Acalepha. This class includes polyps, colonies of polyps which produce polyps, colonies of polyps which produce mediase by budding, and mediase which rise directly from the egg. The polyps, which are small in size, are generally attached permanently to foreign bodies, but sometimes, as in Siphonophora, such as the 'Portuguese Man of War,' the whole colony may be free-swimming. The first polyp as unest an upstanding position termed the Lydranth, which lengthens and buds until it forms a colony or hydrogume. The generative cells or hydrosome. The generative cells which are always ripening and discharging may arise in a variety of places, but al-ways migrate to the ertoderm of the ways migrate to the ectoderm of the gonophore. If feed chiefly on animal substances, and with few exceptions are marine organisms. The class is divided into the orders Hydride (c.q. the fresh water hydra) Hydrocoralline (the corals) Tubularie, Campanularie, Tracho-meduse, Narcomeduse and Siphonophora, Hydruntum, see OTRANTO.

Hydrus: Fabrilous water-snake or sea-rpent. Formerly the name of a genuserpent. of venomous sea-snakes, now called Hydrophis; the hinder part of the body and tall is much compressed and raised vertically to facilitate swimming.

Hydrus (constellation), see HYDRA. Hyeres, or Hières, tn. of the Riviera, in the dept. of Var. 5 France, 11 m. F. of Like its suburb Costebelle, it is a noted winter health-resort, facing the Mediterranean (about 2) in, away). H. Is, (anet. Stee hades), including Port Cros. Porquerolles, He du Levant, form a rond-stead. The tn. hall has a bust of Massical. sillon (1663-1742), and the church of St. Louis and old ruined castle are interesting. Silk twist, essence, brandy, and oil are manufactured, and there is much trade in fruit, flowers, and sult. Pop. 23,600. See C. Lentheric, La Provence Maritime ancienne et moderne, 1880.

Hygieta, goddess of health, was in Gk. mythology the daughter of Asclemus, and was worshipped at Oorinth, Athens, and other places. She is represented as a virgin wearing a long robe, and having by her side a snake which drinks from a cup in her hand.

personal, which affect the health, physical, mental and emotional of the individual or the community. Its main concerns are the prevention of disease and the pro-motion of better health. Improvement in H. Is brought about principally by three processes: (1) The efforts of voluntary organisations formed to meet specific needs which pioneer new ways, until the possibilities are successfully demonstrated and nation-wide acceptance follows. (2) Legislation which is then administered both nationally and especially by local (3) The education of the individual to practise in his daily life the increasingly clear laws of healthy living and to make fuller use of the facilities provided by society for the promotion of personal and community II.
